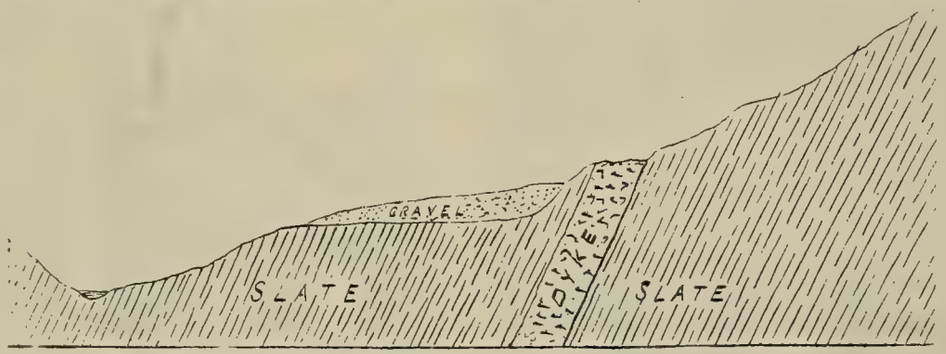
The word "channel" does not convey a correct idea of the nature of these deposits. Although the slate bedrock appears to have a fairly uniform slope of about 15 feet per mile, within the limits of this property, at least, from south to north, and although its surface is worn smooth in the same direction, as if by the action of moving gravel, yet the mass of the material is in no sense a water deposit, nor is any considerable proportion of the rock fragments it contains water-worn. On the contrary, they are for the most part angular pebbles, scattered irregularly through a mass of soil, which near the surface is deeply stained with red and yellow iron oxides and consists mainly of clay. In some of the blocks there is evident stratification of the material; but the planes of these earthy and gravelly beddings slope from the west to the east across the course of the channel, and not from south to north along its length. So far as I have been able to discover, the eastern wall of the channel is gone, or, more correctly, seems never to have existed; so that the floor upon which the auriferous material rests is a shelf of varying width, bounded on the west by the wall of the dyke or by a nearly vertically tilted uplift of the slate bedrock resting closely upon the dyke. The following section across is through one of the blocks of ground lying between Rich and Applegate ravines, locally known as Thoss Flat, is typical.

After several examinations of this interesting deposit, I am unable to account for the gravel, earth and breccia which constitutes its mass; but the gold appears to have come in a state of solution from the diorite dyke to the west. The auriferous nature of this dyke, which bears the name of the "Old Yank lode," has long been known to the miners of the vicinity. Again and again it has been located by enthusiastic prospectors and exploited by shrewd stock speculators, but I can not learn that a dividend-paying era has been attained anywhere along its length.

In the Alexander & Bent property, herewith illustrated, of the 750 odd acres nominally included within its patented lines, about half have been washed away by the numerous ravines and gulches that cross it, and fifteen to twenty acres of the various blocks between these have been washed since it was first located by the various owners. As nearly as can be learned, the yield under operation has ranged from $5000 to $10,000 per acre, according to the depth of the banks. This corresponds to a production of about 15 cents per cubic yard. The costs have varied from 3 to 5 cents or more per yard, according to conditions. When well equipped, the first-named figure should be the maximum.

Water for operation is furnished by Galice creek. Fifteen miles of ditches collected it, but only eight miles are in use. The available watershed above the levees of these is about thirty square miles. Over that area the annual precipitation averages 40 inches, so that quite 4000 inches of water is available. The season for working is about eight months.



At the present time the mine is only partially equipped. Not over 2000 yards per twenty-four hours is being washed. The principal operations are carried on at a point near the northern end. Fig. 1 shows the working pit. Fig. 2 is a near view of a piece of the bank shown in Fig. 1, which displays not only the cross-stratification of the mass, but its remarkable freedom from boulders. The climatic and other conditions in the Rogue River valley are peculiarly favorable for hydraulic mining. The altitudes of the deposits above sea level rarely exceed 1200 feet. The winter, which is the mining season, is mild; the rainfall is very rarely deficient, and the deep canyon of the river with its great volume of water and regular fall carries away all tailings to the ocean.

Fig. 2.—Close View of Banks in Working Pit, A. and B. Mine, Josephine Co., Oregon.

Typical Cross Section Through Block of Ground at Thoss Flat, Josephine Co., Oregon.

PROFESSOR DEWAR, who liquefied hydrogen a year ago, is now producing hydrogen as a solid. Discussing the question of the futility of solid hydrogen in scientific research, he says the mere fact of its transformation from gas is interesting because it is the elementary body of the lowest atomic weight. One of its uses was in the solidification of oxygen and it could also be used in the separation of mixed gases.

Some Observations on Practice of the Cyanide Process at Mercur, Utah.

Written for the MINING AND SCIENTIFIC PRESS by WM. MAGENAU, E. M.

The cyanide process has now had over ten years of application in the Mercur district, and the almost ideal adaptability of most of its ores to this method has led to a steady growth in its milling facilities, until at present about 3000 tons could be treated and about 1800 tons are actually being handled per day. This wide disparity between possible and actual mill output is due to a recurrence of the old error of building an elaborate reduction plant before the mine has been developed, this naturally resulting in a number of abandoned mills, some of them well designed and built. The ability of the larger concerns to treat at a profit exceedingly low grade ore (as low as $2.80 per ton in some cases) seems to have been a dangerous bait to many operators. If their mine showed an average of values but slightly above the minimum treated profitably by the 500-ton-a-day companies, a big mill was immediately put up, with the frequent result of a drop in average to just below pay when the attempt was made to bring the tonnage up to respectable figures. Those companies, however, which proceeded on the more logical lines of developing their mine first, and those which had the good fortune to encounter good ore bodies after taking the venturesome step, have had most encouraging commercial success. The dividends drawn so far amount to nearly $2,000,000.

In its technical aspect, the process has not been materially improved at the hands of its users, the single case where thoroughly qualified professional talent and good facilities for investigation have been provided being under private ownership and all details withheld from the public. The great ease with which a fair, and often a very good, percentage extraction is attainable from most of the Mercur ores has seemingly blinded the non-technical operators to the value of scientific research aimed to add to the proportion recovered and to reduce the amount of chemicals consumed, though very close attention is given to economizing on labor and construction. Just here we meet again the old bone of contention between the so-called "theoretical" and "practical" men as to the relative weight to be given these considerations. It all comes to a question of dollars and cents, and the discussion is a profitless one, but it is thought that in this district is exemplified another of the numerous instances where thousands have been squandered through the reluctance of "practical" managers and directors to pay for technical knowledge.

The ore bodies of the district, as is well known, consist of impregnated sedimentary strata ranging from pure limestone to shales and clays, with intercalated sheets of decomposed porphyry overlying the richer portions of ore shoots. The values in the typical Mercur ore consist almost entirely of gold, silver occurring only occasionally and in very minute amount. Silver ores are mined and cyanided in the closely adjacent Ophir district and will be briefly mentioned later. The gold values in Mercur may be said to range from $3 to $12 per ton, as given by H. L. J. Warren in an article to be mentioned later. Occasional assays run as high as $20 or $30, and very rarely reach $60 or $70. Immense bodies exist carrying from $1 to $2.50, which of course cannot be profitably mined as yet. A classification based on the mode of treatment may be made as follows, the names being those used by local mill men:

1. Oxidized Ore.—Consisting of lime, ferruginous shales, siliceous limestone, some decomposed porphyry, and all the common thoroughly oxidized materials of partially altered sedimentary strata. Probably two-thirds of the ore milled is of this class.

2. Base Ore.—This consists of similar material, but carries a considerable percentage as arsenic and antimony, sometimes as realgar, orpiment, stibnite, etc., but more often as mispickel. While base ore occurs in several mines, but one mill is equipped to treat it. It constitutes roughly one-fourth of total amount milled.

3. Talcy Ore.—This is fully oxidized like the first class, but consists of compact clays (locally known as talc) which disintegrate on contact with water, seriously impede leaching and prevent good extractions. Mills equipped with roasting furnaces leach it successfully after calcining.

4. Black Ore.—In one part of the district there are large bodies of a compact, dull-black material, known to be highly carbonaceous, which carries good values, but has thus far not been successfully treated.

In all of these ores we find a variety of secondary minerals of more or less interest and value. In the oxidized ore, cinnabar is comparatively abundant, its metal being extracted and precipitated with the gold in the course of treatment. At two mills this was sometimes expelled and condensed by retorting the mill product, and many hundred pounds of mercury have been thus obtained. This was later discontinued, and a few months ago shipments of product were being made carrying nearly 2% of mercury, which might have been profitably saved.

Realgar and orpiment are found in beautiful crystallizations, also more rarely native antimony. Curious crystallizations of ferrous sulphate occur. Millerite has been found. Variscite, a phosphate of aluminum resembling turquoise, is met with, and many other rarer minerals. Some of these undoubtedly exert an influence upon the solutions used; at least they are dissolved and appear in the "product," as the gold precipitate is called.

In the outline and notes that follow, the treatment of the oxidized ore is referred to, since the remaining important varieties are treated by only a single mill (the De Lamar, which is well described in the Eng. and Min. Jour. of Dec. 30, 1899, by H. L. J. Warren).

The mesh of the screens in most of the mills ranges from 1 to 2; in only one case (De Lamar) is the ore crushed as fine as 4 mesh (the mesh numbers signify number of holes per linear inch of screen). This is the coarsest crushing anywhere practiced for cyanide treatment, and it is this feature which so materially lowers the cost of treatment. The ore being friable, immense tonnages can be handled with simple appliances. In some cases only gyratory crushers and a single rotary screen suffice for over 200 tons per day. The usual practice is to have a gyratory crusher which delivers its product to rolls.

The accepted explanation for the amenability of these ores to treatment in such coarse condition, sets forth that the gold lies chiefly along the minute lines of fracture, and the solution follows these when the rock is immersed. As to the chemical effects of the various classes of ore, the millman has constantly to control the mine's output, especially where no roasters are used. The class called "oxidized ore" is practically all he can handle. The "base ore" will not extract without roasting, and, besides, often causes abnormal cyanide consumption, some of the arsenic being present as arsenious acid. Consequently, in most of the mines this is left in the ground, regardless of its high gold content. The "talcy ore," which also often carries good values, must be present only in very small proportion, since its presence in larger amounts lowers the percentage of extraction, not only by refusing to release its own values, but by preventing the washing out of the dissolved metal from the remainder of the charge. The "black ore" is, of course, not mined.

The ore, after comminution to the required mesh and sometimes mixed with quicklime, as will be mentioned under chemical considerations, is dumped from cars running on trestles above the leaching tanks, the latter having capacities varying from 16 to 250 tons each. The common ones are of from 30 to 50 tons capacity and are round with sheet-iron sides and 3-inch redwood bottoms. One mill has square iron tanks with wood bottoms, while the De Lamar plant is equipped with square all-steel tanks holding 250 tons each. Still another has an expensive installation of square "self-dumping" tanks constructed of iron and mounted on trunnions, the idea being to discharge the tailings into a bin below by inverting the tank by means of gearing operated by a man-crank. Each tank held 16 tons. The device might be useful for clean, compact material, but with the sticky, clayey ores here met with its operation was far from successful.

As to filter bottoms, a surprisingly simple arrangement seems to suffice. A number of mills handling a considerable proportion of stuff which disintegrates into impalpable slimes on wetting, use nothing but a single thickness of burlap laid on strips nailed onto the tank bottom, other strips to protect burlap from the shovels being placed at right angles to these on top of the burlap. As would be expected, this allows considerable of the slimes to drain off with the solution, but, while most of the solutions used are more or less turbid, the filtration is cleaner than might be thought. A few mills employ more elaborate filters and obtain crystal-clear solutions, but the presence of suspended matter is found to be a positive advantage, as will be further discussed in the remarks on precipitation. The space beneath the burlap fills up with fines in the course of several months, when the filter is taken up and replaced after cleaning. Depth of ore leached varies from 4 to 6 feet. Nowhere is a vacuum used for filtering.

There are commonly no measures taken to mix different kinds of ore before charging tanks, and while this undoubtedly results in channeling, a most surprising laxity seems to have but little effect on the extraction. Solutions are added indifferently from above or below. But one strength of solution is used, this being commonly applied in a series of percolations, the first one lasting about eight hours and subsequent ones being of shorter duration, the whole time of ore in the tanks being from 60 to 120 hours. The former is almost always sufficient; indeed, it seems to be the case that the gold is dissolved in the first few hours of contact and the remainder of the time is required to leach out the solution. This conclusion is reached from the fact that a number of leachings with cyanide solution give better extraction than a few percolations acting for the same length of time, and also from the observed importance of the manner of applying wash water. More direct evidence is had from the fact that in nearly every case where the values left in the tailings are abnormally high, a small sample thoroughly washed in the laboratory (by agitation and filtration) gives up excess over the normal amount retained. This is frequently caused by the presence of "talcy ore," as previously mentioned. As to what is a "normal" extraction, it may be said that on direct treatment of "oxidized ore" carrying from $3 to $5 gold per ton, from 70% to 80% is obtained, the common range being 72% to 76%. On ore running from $5 up, the extraction is normally above 80%, while with treatment of "base ore" after roasting, 90% and over is the figure.

The usual procedure in washing is to drain the last cyanide solution pretty well off, then run on a tankfull of water, draining this off—sometimes immediately and sometimes after standing—depending upon the capacity and condition of the sumps. The water pipes are of comparatively small diameter and the water is necessarily run on slowly. An improvement was made by spreading a canvas over an entire tank and flowing the wash-water rapidly upon this, afterwards drawing out the canvas. This allowed the wash to descend evenly through the charge and gave cleaner results. Another modification, curtailing the time devoted to cyanide leaching and devoting a corresponding amount to washing by allowing charge to stand with water and giving an extra wash, resulted in a marked increase of percentage of extraction. In this case it was necessary, however, to run to waste each day a certain amount of solution containing KCy and some gold, but this loss was more than counterbalanced. Usually the amount of wash-water applied is made to equal the amount of moisture retained by the tailings, so the volume of liquor in circulation is constant. All cyanide leachings and water washings are drained into a common sump and run through a single set of zinc boxes. As to the discharge of tailings, nowhere in the district is water plentiful enough to allow of sluicing them out, and the universal practice is to shovel into cars running on tracks beneath the tanks. This is commonly done by contract and costs from 5 to 11 cents per ton.

Coming now to a consideration of the method of precipitation employed, with one exception, the regulation system using zinc shavings disposed in rows of boxes is in vogue. The DeLamar plant uses a patented process of precipitation with zinc dust and compressed air agitation which is very successful and admits of the expeditious handling of enormous tonnage of solution. The zinc used for shavings is the ordinary No. 30 gauge sheet zinc, obtainable in "casks" of 600 pounds each. It is cut by wrapping six sheets (twelve pounds to sheet) around a wooden mandrel 5 inches in diameter, and bound tightly with heavy cord; the mandrel is then placed in a screw-cutting machine lathe, and a cutting tool held by the automatic carriage cuts the shavings from one end of the roll. With a mandrel geared to fifty revolutions per minute and cutting to $\frac{3}{1000}$-inch thickness, fifty pounds per eight-hour shift could be made, requiring only the occasional attention of the engine man to sharpen the tool. A speed of 100 revolutions per minute is also good, but the machine then requires more careful watching. Tools are always made of the brand of steel known as "musket," or "self-tempering," which can be sharpened on dry emery wheels.

A notable feature of the zinc-shaving precipitation here employed is the success in handling solutions very low in gold. And what is here called "very low" is far beneath the figures given by the adherents of electrical precipitation in South Africa as being the minimum for successful zinc treatment. Under normal conditions, the richest solution handled anywhere in the district carries only $3 or $4 per ton, while several mills operate with the pregnant solutions averaging from 60 cents to $1 per ton. The writer's experience with one of these weaker solutions was an average precipitation of over 90%. The zinc space employed was 1 cubic foot for every 3.5 tons of ore per twenty-four hours. The number of tons of solution passed through per hour was not determined, the amount being variable and influenced by the necessities of the leaching department.

(TO BE CONTINUED.)

Unaccompanied by Affidavits.

"Up at my camp near the Four Peaks," said Jim Bark to the Arizona Grapevine, "the boys are all handy with a rifle. We've a lot of guns up there. The old-fashioned black-powder Winchester has been discarded, and nothing but the best goes. Most of the new guns were bought during the Spanish war, when we could experiment all day with tree trunks and rough trenches, learning the art of war at home. We found that a bullet from one of the new Winchesters, driven by smokeless powder, was good for four foot and more of pine timber and for more than an inch of iron. I thought the boys had done about everything in the shooting line that could be done long ago, but I was mistaken. I sent them up a wagon. In hauling down some firewood they broke the bolsters all to flinders. The bolsters hold up the wagon bed, you know. Well, the boys figured out all right the rebuilding of the wood parts, but came near being stumped on the iron fixings. They got some old iron wagon tires and cut them in proper lengths, but hadn't a way that they could see to punch the necessary bolt holes. Finally the question was solved. One of the boys carefully marked the places for the bolts, stood the piece of tire against a tree and put a bullet, 30 caliber, through the tire at each place marked. It was a novel sort of blacksmithing, but it worked."

MINING SUMMARY.

ALASKA.

(Special Correspondence).— There are two 120-stamp mills on Douglas island. The two mills have twenty-two employes —eleven each—against twenty-three in the 300-stamp mill, quite a saving in labor. The 300-stamp mill is 1800 feet from the mine. It costs about 1 cent a ton for labor to haul the quartz from the mine to the mill. It is claimed that from the starting of the 300-stamp mill last May till the closing down on the 12th of December the cost of mining and milling was but 73 cents a ton. The 240-stamp mill of the Treadwell is included in this also, both together crushing 1950 tons a day. The 300-stamp mill runs only by water power and started on the 21st of this month.

Douglas Island, March 30.

Circle City reports a "mad rush" of 600 men from the camps along the American Yukon toward the new Koyokuk diggings. According to the transportation companies "$100 to the pan is a common thing at Koyokuk." That ought to be worth considerable to those interested in getting men up there.

The Alaskan civil code bill has the following amended provision: "That subject only to general limitations as may be necessary to exempt navigation from artificial obstructions, all lands and shoal water below mean high tide on the shores, bays and inlets of Bering sea, within the jurisdiction of the United States, shall be subject to exploration for gold and other precious metals by citizens of the United States or persons who have legally declared their intentions to become such, under such reasonable rules and regulations as the miners in organized mining districts may have heretofore made or may hereafter make, governing the temporary possession thereof for exploration and mining purposes until otherwise provided by law. Provided further, that the rules and regulations established by the miners shall not be in conflict with the mining laws of the United States, and all permits heretofore granted authorizing any person or persons, corporation or company, to excavate or mine under any of said waters, are hereby revoked and declared null and void; and the reservation of a roadway 60 feet wide, under the tenth section of the act of May 14, 1898, entitled 'an act extending the homestead laws and providing for the right of way of railroads in Alaska and for other purposes,' shall not apply to mineral lands or townsites."

The 18th inst. was devoted in the Senate to consideration of the bill of Stewart of Nevada opposing the above amendment. He talked three hours, reviewed the mining laws of the State to the extent that they related to aliens' rights in the Alaskan gold fields, and defended the rights of the Laplanders, Swedes and Norwegians who had entered mining claims in the Cape Nome district.

Nelson of Minnesota followed Stewart, also sustaining the aliens who had located the mining claims in question. Hansbrough of South Dakota interrupted Nelson to read a paragraph from a document drawn by the Law and Order League of the Cape Nome district, which declared that the people whom Nelson said had located the claims were not really the locators of the claims. In reply, Nelson denounced the Law and Order League as an organization formed to jump claims located by honest prospectors.

Tillman of South Carolina agreed with Nelson in what he had said of the right of the Swedes, Norwegians, Laplanders and Finns.

Carter of Montana made an earnest and forceful appeal to the Senate that the American miner—either native born or properly naturalized—should have the first claims upon the mining lands of the United States. He said in the course of his remarks that he had no desire to change the mining laws, but intimated that Teller of Colorado and others were trying to change them.

Teller declared that Carter, "under a pretended zeal for the American miners," had attempted to shift upon him the responsibility of a desire to change the mining laws of the United States.

After further discussion, the bill was laid aside.

ARIZONA.

W. P. Blake, at Tucson, places the output of Arizona copper mines in 1900 at 150,000,000 pounds. He predicts that within a short time the Territory will outrank Michigan and Montana as a copper-producing district. Through the death of John D. Emersly forty or fifty mining claims in Cochise Basin district have been made available for production.

GILA COUNTY.

The Old Dominion smelter has resumed work.

PIMA COUNTY.

In the Horseshoe basin, south of Tucson, fifty Indians are working the new gold diggings. Being within the reservation, whites are barred.

CALIFORNIA.

GOLD AND SILVER PRODUCT OF CALIFORNIA BY COUNTIES FOR 1899.

The Superintendent of the U. S. Mint at San Francisco has forwarded to the Director of the Mint, Washington, the following table of approximate distribution by counties of the gold and silver product of California for the calendar year 1899:

County.	Gold.	Silver.	Total.
Amador.	$1,544,868	$6,902	$1,551,770
Butte.	486,846	5,009	491,855
Calaveras.	1,265,564	9,813	1,275,377
Del Norte.	4,450	.....	4,450
El Dorado.	404,497	8,414	412,911
Fresno	18,142	.....	18,142
Humboldt.	69,059	.....	69,059
Inyo	114,187	57,529	171,716
Kern.	863,414	6,810	870,224
Lassen.	28,898	.....	28,898
Los Angeles	13,132	.....	13,132
Madera	73,758	292	74,050
Mariposa.	562,829	2,207	565,036
Mono.	697,069	47,547	744,616
Nevada.	2,171,510	17,784	2,189,294
Placer.	1,100,081	1,206	1,101,287
Plumas.	381,151	15	381,166
Riverside.	163,010	2,000	165,010
Sacramento.	115,906	.....	115,906
San Ber'dino	164,599	125,603	290,202
San Diego.	333,650	.....	333,650
Shasta	873,719	196,213	1,069,932
Sierra.	450,115	359	450,474
Siskiyou.	991,771	100	991,871
Stanislaus.	10,000	.....	10,000
Trinity.	590,510	1,086	591,596
Tulare.	13,610	.....	13,610
Tuolumne.	1,635,769	15,111	1,650,880
Ventura.	3,990	.....	3,990
Yuba.	189,927	12	189,939
Total.	$15,336,031	$504,012	$15,840,043

The silver is given in commercial value, or amount obtained for it by producers when sold. In the total for the year the commercial value of the silver is $504,012, as stated, the coining value, however, of this total being $1,106,578. It is noted by Mr. Chas. G. Yale, the statistician of the U. S. Mint at San Francisco, that, comparing the totals of gold and silver with corresponding figures obtained from the same sources in the year 1898, the gold yield of the State shows a decrease of $570,447 and the silver yield an increase of $89,957, making a net decrease from the previous year of $480,490, but that this is a very good showing in view of the dry season last year, when so many quartz mines had to hang up part or all of their stamps for a time, and when the water season for gravel mining was very short indeed. Considering these conditions, in view of the fact that the State nearly held its own in bullion product, it is seen that the mining industry is really progressing instead of declining in product.

Further analysis by Mr. Yale shows that of the total of $15,840,043, the value of combined gold and silver produced, the sum of $12,290,138 came from quartz mines, $1,128,564 from hydraulic, $1,019,955 from drift and $1,401,386 from placer mines. Included in the placer output is that derived from dredges, river bed and bar, gulch, ravine, and ordinary placer work by Chinese and whites. In the returns from quartz mines are included $353,743 gold and $210,219 silver, derived from copper mining and smelting operations in Calaveras, Shasta and San Bernardino counties. Also included in quartz returns are $5021 gold and $64,620 silver from silver-lead mines in the counties of Inyo, Mono and San Bernardino. Thirty counties of California produced gold, and twenty of these return some silver product. As nearly all the mines are gold properties, numbers of them make no return of silver or report the product as only "nominal." Nevada county is still the "banner" gold-producing county as it has been for some years, but this year for the first time Tuolumne county takes second place, displacing Amador county from that position. As compared with the previous year, Calaveras county shows the largest increase in product, though Mono county is not far behind in this respect. The largest decrease in production is in Placer county, followed in order by San Diego and Trinity counties.

The returns to the Mint show the employment of 18,701 miners in gold, silver, lead and copper mines of the State, a decrease of 1122 as compared with the previous year.

ALAMEDA COUNTY.

The H. M. Calderwood Placer M. Co. has organized at San Leandro; W. S. Peters, G. M. Flint, Oakland; C. H. Gray, C. H. Hale, H. M. Calderwood, H. G. Tassell, E. Richards, T. Morgan, W. H. Gray; capital stock $10,000; all subscribed.

AMADOR COUNTY.

To San Francisco on the 19th inst. was brought what the shipper says was sold to him for a meteor. The chunk weighs 1800 pounds and is locally considered valuable, as most of it is thought by the shipper to be copper. He says he bought it from a man in that county who told him that it fell from the skies about fifteen years ago, and many residents of that county say they remember a meteor falling there about that time. It is about the shape of a potato and seems to be of the usual composition of aerolites.

Effort is being made to buy the old Eureka mine at Sutter Creek from Mrs. Hetty Green.

The Mountain King mine at Pine Log has been bonded for $12,000.

Knight & Co. are building the new hoist for the Baliol mine.

A depth of 1675 feet has been attained at the Central Eureka, Sutter Creek.

At the Kennedy the new east shaft is down 1300 feet; the 40-stamp mill is in constant operation.

BUTTE COUNTY.

T. W. Reece, Supt. Amo hydraulic mine at Oroville, says active operations will be resumed on the property.

CALAVERAS COUNTY.

The Eagle G. M. Co., capital stock $60,000, H. S. Dawson, F. Cutting, G. Walker, E. W. Hayden, M. Folsom, W. F. Jordan, J. S. Mills, will operate at Cave City.

The Kentucky mine is being unwatered.

EL DORADO COUNTY.

(Special Correspondence).—The Grand Victory mine has again resumed operations, after being idle for several months. They are now crosscutting on the 300-foot level in good ore. At this point the ledge is over 60 feet wide.

The Larkin mine is running ten stamps and doing well.

Hayward & Lane have secured an extension to their bond on the Ribbon Rock, after the mine lying idle for about thirty days. The main shaft is being pushed down.

C. H. Dunton is opening some old claims to the west of the Live Oak and Marguerite mines. These old claims have been idle for about twenty years, and, in crosscutting from the tunnel level, he has 16 feet good milling ore. The Marguerite will resume operations about May 1.

The old Pacific M. Co. has bought two claims adjoining the Pacific on the east. This gives them all of the rights to the east vein which they did not before own. The old Pacific took out over $1,000,000 in the first 700 feet of surface workings. The property is owned principally in London; Henry Baring is Pres.

The thirty-day mill run on the Boulder mine has been finished and proved satisfactory to the new purchasers. It is said by one of the parties interested that the property will be taken up by the new company and work prosecuted more vigorously than heretofore.

Placerville, April 18.

NEVADA COUNTY.

The Dakota M. Co., to develop the Magnolia gravel mine at Forest City, has incorporated in Nevada City; capital stock, $30,000—all subscribed.

PLACER COUNTY.

(Special Correspondence).—The Dutch Flat Blue Lead Gravel M. Co. will take out rich gravel. Drift mining was done here before the days of hydraulicking; then came the little giants, with which the surface to a considerable depth was washed off; and when an injunction of the courts restrained this species of mining, recourse was again had to the drifting process. S. C. Jordan of Dutch Flat purchased the property several years ago for $25,000. His purchase included 110 acres in surface area; besides an hydraulic tunnel is driven through bedrock, which will drain the entire area into Bear river. Should hydraulicking be again permitted, this tunnel will prove valuable. Present development as a drift proposition consists primarily of a bedrock tunnel 800 feet long, extending from the hillside, where the mill is situated, to the east limit of the gravel channel. This tunnel is below the channel, and upraises have been put in at six places. Upraise No. 2, 450 feet from the face of the tunnel, has been extended to the surface as an air shaft. Upraises Nos. 3 and 4 struck pay gravel. At upraise No. 5, 22 feet above the tuunel, a drift 450 feet in length extends across the channel. Here considerable gravel has been breasted out and sent to the mill. Upraise No. 6 strikes the east rim of the channel, which, on the average, is 500 feet wide, and embraces a stratum of gravel 15 feet thick. The value of the gravel varies from 90c to $2.50 per carload. The gravel is blue, strongly cemented, and filled with cobbles as hard as flint. These are run through a rock breaker and are crushed with the gravel in a 10-stamp mill of extra heavy pattern, run by water power; four tons per hour can be crushed. Sacramento men have the property bonded. Wm. H. Bellows is foreman.

The Polar Star at Dutch Flat, formerly a hydraulic mine, then a drift proposition, is a hydraulic mine once more, working under permit of the Debris Commission, with a dam in Bear river. A spillway 40 feet wide has been cut at the side. The water going through the spillway is free of sedimentary water. The dam is 25 feet high, and will soon be raised another 25 feet. The Polar Star uses 2800 inches of water under 450 feet fall, the same being brought through 3500 feet of 22-inch pipe, and branching into two 15½-inch lines a short distance from the nozzles. One 8-inch and one 9-inch stream play against the bank at the same time. This makes a strong flow of water, carrying along by its force a large proportion of the boulders that plentifully abound in the gravel. At present the water and debris are taken through 600 feet of 5-foot flume on a 10-inch grade, and are dumped into the Little Bear river above its junction with the main stream, where the dam is located. When not going through this flume the tailings are conducted through 600 feet of bedrock tunnel leading directly to Bear river. There are two sets of 8 and 9-inch nozzles, one at each side of the mine, but only one set is used at a time. The company has insufficient water to keep the monitors constantly at work, so the water flow is confined to 2½ hours in the morning and 2½ hours in the afternoon. The work is profitable. The Southern Cross gravel mine, with a bedrock tunnel 1050 feet long leading to Bear river, adjoins the Polar Star and belongs to the same company, but is now idle. Wm. Nicholls Jr. of Dutch Flat is principal owner and superintendent of these mines; Geo. V. Nicholls, his son, is foreman; twenty-five men are employed. The Liberty Hill hydraulic mine, located in Nevada county, two miles above the Polar Star, utilizes the latter's dam, the two companies sharing expense of construction and maintenance.

The Gold Run Gravel Mining Co. is conducting a hydraulic mine in ground which was extensively worked in a similar manner years ago, one mile east of the town of Gold Run. The loose formation was hydraulicked to a depth of 100 feet over a large scope of territory, but in few instances was the bedrock uncovered. The present company is using two monitors, one a half mile below the other, and is doing good execution against a bank containing several strata, one of which is a blue gravel channel nearly 30 feet thick, lying next to bedrock. The tailings from each monitor go into a bedrock tunnel or flume 1200 feet long leading to Canyon creek, a tributary of the American river. Here is a log and brush dam, 65 feet high, built under permit of the Debris Commission. The water supply for the operations of the company is taken from the Bear and Yuba rivers, being brought 25 miles through the company's ditch, and is delivered to the monitors under a fall of 200 feet. A portion of the blue, cemented gravel can be run through a 10-stamp mill stationed near the lower diggings. The stock in the company is held by English people. J. E. Doolittle is general manager, Jas. Stewart of Dutch Flat superintendent.

The Inskip G. M. Co. at Gold Run has a permit to construct a restraining dam and is about to begin operations. As in the case of the Gold Run Co., they will resume at the site of an old hydraulic mine, and they have built a 25-foot restraining barrier 1½ miles below the diggings. They will employ a single monitor, with water under a pressure of 175 feet. The tailings will be conducted through a bedrock tunnel 535 feet in length, begun last October and just completed. Boulders and cobbles the size of a walnut and larger will be eliminated by means of grizzlies, and these will be taken by the Southern Pacific Railway Co., who will run them through a Gates crusher with a capacity of 15,000 tons per day, and will use the broken material as ballast for their roadbed. They will employ fifty to seventy-five men in handling this refuse from the Inskip mine. The mine itself will employ twelve men. The company is composed mainly of local people, with E. A. Moody of Gold Run as superintendent.

Henry Runckel is working by the ground sluice process a claim owned by himself and Mrs. H. R. Runckel, known as the Nary a Red, near the end of the old Alta channel. They bring 100 inches of water from Little Bear river to their reservoir, near the mine, and two or three times per day open the reservoir gate and allow the accumulated flood to wash down the bank. The claim is a good one and pays moderately.

The Paragon, or Breece & Wheeler, is a combination drift and hydraulic property at Bath, 3 miles from the town of Forest Hill. The drifts in this mine are connected with the workings of the Mayflower, which was at one time a very extensive gravel property. The two mines are on the same channel, which also extends to the Dardanelles, on the other side of the Mayflower. The original operators worked out the best pay in the cen-

ter of the Breece & Wheeler channel, and the drift work that is now being prosecuted is by lessees, who find good pay on the rims and upper leads. They have a tunnel 400 feet in length, bringing the cemented gravel to a 10-stamp mill, where water power under 400 feet head has recently been substituted for steam. The company laid 1100 feet of pipe in order to get the above head, and now run their mill with 15 inches of water. T. M. Brown and Wm. Rea Jr. are the lessees of the drift portion of the mine. In the latter diggings a 4-inch monitor is used, with a fall of 200 feet. They make three runs per day of about one hour each. Both portions of the mine are paying well. In the drift mine fifteen men are employed, and in the hydraulic about the same number.

Marchant, McDonald & Vennewitz have a bond on the Dardanelles mine at Forest Hill. This is an old drift mine which yielded well years ago, but which was considered worked out, so far as the main channel is concerned, and was abandoned. The present operators unwatered the old drifts and have put in an electric plant for the hoist and pump. They have been prospecting for six months and feel that they have demonstrated the existence of another channel. They are running a bedrock tunnel to intersect it, and within 100 feet hope to strike rich gravel. There is a 10-stamp mill on the property and the company has a reliable water supply for seven months of each year.

The Big Gun gravel mine at Michigan Bluff has a claim of 500 acres, part of which was hydraulicked in former years. They have a 11-inch pipe line 600 feet in length and throw water through a No. 2 monitor under a head of 200 feet.

The Michigan Bluff M. Co. is composed of Auburn business men. They are developing a gravel proposition adjoining the Big Gun by driving a tunnel through bedrock in the direction of the channel. This tunnel is now in 400 feet, and an upraise is being driven for an air shaft and to determine the value of the gravel at that point. The tunnel will be continued at least 400 feet farther. An old tunnel, 45 feet higher, 1100 feet in length, was run several years ago by a former company. M. H. Burns and three co-workers are driving the tunnel, having been employed since November last.

The Morning Star gravel mine is within a mile of Iowa Hill. Its underground workings are connected with the Big Dipper, which claim joins it on the south. It is thought they are on the same channel. The Morning Star tunnel is 4400 feet in length, with upraises to gravel each 200 or 300 feet. These upraises are usually 38 feet in height, and are divided into three compartments, two chutes for the gravel, with a ladder-way between. A shaft 488 feet deep gives excellent ventilation. The channel has an average width of 275 feet, and 500 carloads per week are extracted. The gravel is cemented and is put through a 10-stamp mill, run by water, with a steam plant in reserve. The company has its own storage reservoir, and by means of a pipe line 1200 feet in length obtains a fall at the mill of 450 feet. The Morning Star is one of the most reliable dividend payers in the State. H. T. Power is Supt.; H. Simons, foreman. About forty men are employed.

As before stated, the Big Dipper mine joins the Morning Star on the south, its mill being located about three miles from Iowa Hill. The tunnel is 4500 feet in length, being below but following in general the sinuosities of the ancient river channel, 500 to 600 feet wide, from which the cemented gravel is taken through upraises converted into chutes. A portion of the gravel is put through a rock breaker and is then washed, while another portion goes through rock breaker and a 10-stamp mill. This mill is run by water under 270-feet fall, while a 6-foot wheel operates an air compressor, which in turn furnishes power for the machine drills in the mine. A steam plant in reserve is usually resorted to from June to November, each year, while the water supply is low. The output of the mine is 725 to 900 carloads of gravel per week. About seventy-five men are employed. Seymour Waterhouse, Gen. Mgr.; F. H. Schulze, foreman.

John Watts, near Iowa Hill, owns the Strawberry gravel mine. He has driven a tunnel 2000 feet, following up the gravel channel, which is 50 to 60 feet wide. The gravel is blue, but free washing, and is yielding satisfactorily.

W. E. Pinkston, who has a bond on a copper claim owned by P. Oest, seven miles north of Auburn, is about to buy a gasoline engine and pump. Some of the unassorted ore from this ledge, worked by the Pioneer Reduction Co. of Nevada City, went 18.3% copper.

Iowa Hill, April 12.

PLUMAS COUNTY.

(Special Correspondence).—We have had to date 68 inches precipitation, 4750 feet altitude, 76 inches being the mean annual average. There is practically no snow below 5000 feet, and no snow masses of any size below 6500 feet, where the average depth is about 3 feet. A good season for water is expected.

Quincy, April 17.

At Crescent the Talbot-Fulton M. Co., capital stock $10,000, P. G. Stout, B. H. Talbott, J. M. Fulton, C. L. Taylor, J. E. Pardee, has completed a mill, has sixteen men employed, and will push development work and run the mill steadily.

Chapman & Macomber have under bond the Johnny Bull group, near Greenville, and will soon begin the erection of a mill.

SAN JOAQUIN COUNTY.

The Miocene Oil Co. has organized at Stockton; H. R. Campbell, H. T. Compton, H. C. Meyers, C. L. Ruggles, G. F. Bush; capital stock $75,000; subscribed $450.

SHASTA COUNTY.

The contract for the new smelter to be erected by Capt. De La Mar on his Bully Hill properties was this week awarded S. V. Trent. The undertaking involves a cost of about $100,000. The plant will be pushed to completion.

In London the Mountain Copper Co.'s shares are quoted at £8 to £8| per share. The capitalization of the company is as follows: Number of shares, 250,000; par value, £5; latest dividend, October, '99, 9s per share, or a total of $362,500. The stock quoted at £8 represents a capital of $10,000,000.

The annual report states that the quantity of ore taken out of the mine in 1899 was 203,965 tons, as against 221,895 tons in 1898 and 165,060 tons in 1897, while the quantity smelted was 176,689 tons, as against 168,541 tons in 1898 and 97,185 tons in 1897. The quantity of copper in matte produced at Keswick was 10,664 tons, as against 10,721 tons in 1898 and 7238 tons in 1897, and the output of fine copper at the New Jersey Works was 11,388 tons, as against 8273 tons in 1898 and 5958 tons in 1897, the increase being due to the working-up of the matte brought forward from the previous year. The finished copper sold for delivery during the year was 9647 tons, as against 8237 in 1898 and 6025 tons in 1897. At the close of the year there were large stocks of matte and fine copper on hand, the profit on which will come into the new year accounts. The net profit for the year was £335,110, compared with £136,234 in 1898. It is proposed to pay a further dividend of 11s per share, making 20s for the year, or 20%, and after placing £80,000 to reserve and depreciation account, a balance of £5240 is carried forward.

SISKIYOU COUNTY.

(Special Correspondence).—A singular accident occurred at the Gold Run mines at Gilta recently. Mr. McCloud, a miner, had fired a hole in the stope in which he was working, and had returned to drill another hole when a mass of ore fell. His skull was slightly fractured, two of his ribs were broken and one ankle joint entirely dislocated. It seemed as if the foot had been cut off square at the ankle, dangling by the skin only, though Dr. A. C. Helm, the mines' official physician, states that no tendons or arteries had been cut and that Mr. McCloud would be all right again in a few months.

The stopes of the Hunter vein keep the 10-stamp mill supplied when not occupied with ore from the winze, now sinking by power drills, in the lower tunnel. The winze is 120 feet deep; the 4-foot vein, mixed with waste, goes to the mill unassorted. Two feet of the vein is rated at $30 per ton.

Yreka, April 16.

SONOMA COUNTY.

Near Santa Rosa the Oakland quicksilver mine is producing forty flasks a month and the Cloverdale mine an equal amount. The Great Eastern at Mercury, near Guerneville, ships an average of 250 flasks a month. The combined output of the various mines is about 700 flasks per month.

TRINITY COUNTY.

E. A. Wagner, manager of the Dieffenbacher M. Co. at Coffee Creek is installing new machinery. The company is operating two drills in its mine and a 12-stamp mill.

TULARE COUNTY.

The Buena Fortuna M. Co. has organized at Visalia; B. Hicks, J. H. Newman, J. Fraus, A. Piderson, I. Goldstein, D. L. Clatfitter, P. E. Burns; capital stock $192,000; subscribed $200.

TUOLUMNE COUNTY.

Secretary A. N. Winslow of the Boston & Tuolumne G. M. Co. has returned to Boston. The main shaft is down 400 feet. Sinking goes forward at the rate of about 50 feet per month. When the 600-foot level is reached the various levels will be extended and crosscuts driven. The mine is in charge of Philip Deidesheimer.

COLORADO.

FREMONT COUNTY.

(Special Correspondence). — The improvements at the works of the National Gold Extraction Co., by which the capacity is being increased, are almost complete. A new condensing engine has been put in place, which drives a 275 H. P. electric generator, by which the entire mill will be operated by six different motors. A 30 H. P. motor will run the concentrators; a 40 H. P. and a 50 H. P. motor for the four sets of rolls; one 40 H. P. for the chlorine barrels; and two motors of 10 H. P. each for the furnace machinery. Besides the roaster which has been operating from the first, a Holthoff-Wethey roasting furnace has been added. Its size is 12x120 and roasts in the top chambers and cools at the bottom. To the roaster an automatic cooler has been added. Also three chlorine barrels have been added, making five in the mill, raising the capacity 180 tons per twenty-four hours. WASCOTT.

Florence, April 12.

(Special Correspondence). — The Colorado Electric Power plant at this place is equipped with three Westinghouse, three-phase generators, each 750 H. P., and run by a Hamilton cross-compound Corliss engine. The power is generated at 500 volts, transmitted 24 miles at 20,000 volts. At the plant are four step-up transformers and the same number of step-down in Cripple Creek district, where the power is used. WASCOTT.

Canyon City, April 13.

GILPIN COUNTY.

The Post says that within sixty days a good many miners will be needed in Gilpin Co., as a number of prominent mines are preparing to start up on a large scale, one of which will require from 125 to 200 men. About May 1 another will need forty to fifty; a third will put on new forces in about forty-five days; a fourth will increase on or about the first of next month.

LAKE COUNTY.

(Special Correspondence). — The Leadville & Red Cliff Power, Light & Water Co., has been organized by John F. Campion, Chas. Boettcher, S. W. Mudd, W. B. Page and Chas. Cavender. The purpose is to develop water power on Eagle river and put in an electric power station between Red Cliff and Minturn. At the proposed station it is estimated a water pressure of 750 feet will be obtained. One of the main objects in view is to be able to operate electric hoists in the Leadville district.

Leadville, April 12.

OURAY COUNTY.

A strike in the new Camp Bird tunnel is reported at 300 feet greater depth than the old workings. It is thought that next summer the Camp Bird and American Nettie will double their force of miners.

The Calliope mine at Ouray has been sold on bond and lease to a Chicago company for $300,000. The terms of sale require the expenditure of $30,000, and the sinking of the working shaft to a depth of 800 feet. The purchasers also agree to extend the development work a total of 2000 feet. The mine has been a steady producer for ten years, the ore being free milling.

PITKIN COUNTY.

H. B. Gillespie has charge of the Leadville mine at Lenado. He has a three years' lease and will place a hoist, operated by compressed air, at the tunnel level, where a station will be cut and the water taken out of the shaft. A four-drill compressor is now in place.

ROUTT COUNTY.

Steamboat Springs is attracting renewed attention. The placer mines at the western base of Hahn's peak are not as presently prominent as the recently reported copper veins of Columbia Basin.

TELLER COUNTY.

(Special Correspondence).—The Elkton Consolidated Co., capitalized at $3,000,000, has been organized to take over the Elkton, Raven and Tornado mines, all on Raven hill. The 3,000,000 $1 shares are apportioned as follows: To the Elkton owners, 1,375,000; Raven owners, 625,000; Tornado owners, 500,000; and 500,000 shares to go into the treasury of the Consolidated Co., to be sold to acquire new territory. By the consolidation costly litigation is avoided.

The Isabella is developing at the rate of 1800 feet per month, but no stoping is being done. President Nelson B. Williams announces that this policy of development and non-production will be kept up until better treatment charges shall be obtained.

The March shipments from the Orizaba brought $18,000. Two new boilers and a 10-drill compressor are being put in.

A shoot of ore has been opened in the Uncle Sam shaft at 195 feet, assays from which returned $130 per ton. This property is on Bull hill and belongs to the Blanche Co., which purchased it at $65,500 several months ago.

Cripple Creek, April 15.

IDAHO.

SHOSHONE COUNTY.

The Mountain Summit M. Co., with headquarters at Wallace, is being organized to work the Rialta, Pedicord and Minnie claims, 4 miles north of Burke.

MICHIGAN.

One hundred miners at Franklin Junior, at Houghton, have struck for 10% raise in wages. The manager had raised laborers' and trammers' wages $2 and $2.50 per month, about 5%, on April 1; present wages are $49 per month for common labor, $52 for trammers and $54 for miners As at other lake mines, best miners work principally on contract and average higher wages than paid men working on company account.

MONTANA.

CASCADE COUNTY.

At Neihart the Silver Belt M. Co. has organized. Its property is at the head of Rock creek. Capitalization $25,000. The Silver Belt lode is a north extension of the Broadwater group. It is developed by open cuts and shafts, all the entire course of the main vein showing a ledge 6 to 8 feet in width, carrying high-grade ore.

FERGUS COUNTY.

The order by the Gilt Edge M. Co. that all single men employed at the mine and mill board at the company boarding house has caused several to quit.

PARK COUNTY.

Livingston argues that a smelter there would prove to be a paying investment.

NEVADA.

LINCOLN COUNTY.

(See illustrations front page.)

(Special Correspondence).—The material for the equipment and improvements at De Lamar was freighted by wagons from Milford, Utah, a distance of 170 miles. The building of the Utah & Pacific from Milford to Uvada in 1899 places De Lamar within seventy-five miles of the railroad. While no special announcement of intention has appeared, it is generally understood that the Utah & Pacific will be extended southwestward this year through Lincoln Co., Nevada, toward the California line. When this county shall have been made more accessible by some such transportation line, more thorough prospecting and development of its mining resources will be possible. It is a section requiring considerable capital with which to operate, not alone for the mining and milling features, but for the development and distribution of water supplies.

What may be called the De Lamar district takes in an area of about fifteen miles east and west by twenty miles north and south, wherein, the local records show, there are nearly 1300 mining locations, the first having been made in 1891. The De Lamar group extends across what is locally known as Lookout mountain, covering a great quartzite lode, which trends nearly north and south. The property is opened through a series of tunnels, cutting into the mountain one above another, following the strike of the mineral zone northward. The formation is a quartzite, being about 80% silica, and is somewhat broken by porphyry dykes cutting diagonally through the otherwise regular quartzite strata. While the mineralized shoots are referred to as veins and ledges, there seems to be an absence of distinct walls or vein matter distinguishable from the regular formation. To illustrate this, it may be cited that experienced miners employed in the mine are unable as a rule to discriminate between ores of high grade and those carrying practically no values. But it seems to be a case in which a great zone of the country rock has been mineralized by infiltration of gold in solution. A distinguishing feature of the property, and one that marks the strike of the mineral deposition, is the existence of a north and south fissure, filled throughout by a decomposed material consisting mostly of clay and talc, but which carries no values to speak of. This, locally known as the great gouge, is traceable for several miles and is known to wave and wind considerably, while keeping the same general course. The quartzite formation through which it passes has been impregnated with gold to a varying extent. In a great open cut half way up the mountain side, on the De Lamar group, the character of this gouge is readily observed. The lower tunnel, known as No. 10, is on a level with the crushing floor of the mill and advances northward over 2000 feet. Above it are similar tunnels about 100 feet apart, almost to the summit of the mountain. From the 10th to the 5th is an electrically operated skip, used solely for a manway. A rock-walled chute passes from the higher levels to the 10th, connecting with

which all the ore is sent to the 10th level, there loaded into cars and trammed to the mill. The mine timbers are unloaded and framed at tunnel No. 5 and distributed by gravity to the stopes below.

The ore is stoped out in immense chambers, many of which are from 40 to 100 feet wide and 80 to 200 feet long, well timbered up in square sets and as the work proceeds upward the space between sets is filled with waste. Thus the work goes on from level to level and horizontally on each level, in the course of which are seen some excellent specimens of mine timbering. An illustration of the system employed is seen by the general superintendent's mine chart, on which is recorded the assay value of the ore from every block or square set on any level or stope in the mine. From forty to fifty assays are made each day from ores collected by the sampler, from which the daily record is made up.

As is generally known the mill is a cyanide reduction plant, in which the ores pass through a coarse crusher, thence through Griffin mills, of which there are thirteen in number, and by which the material is ground to from 60 to 80-mesh. It is carried by conveyors and elevators to the pulp tanks and leaching vats. The infinitesimally fine dust particles are blown into five collectors, caught in the collector stockings, from which the air escapes and the dust is thrown down to a conveyor, which carries it to the cars and thence to the leaching tanks. The dust thus saved contains a high percentage of value. The mill crushes about 300 tons of ore per day. The leaching tank capacity is 9000 tons per month and about 3200 tons of material are constantly in course of treatment through the mill. Two large vacuum tanks serve their purpose in drawing the liquid from the leaching tanks to the precipitating room, where zinc dust is used instead of zinc shavings. The equipment for reducing the auro-cyanides to bullion is quite complete, and once a month the gold bars are shipped in a burglar-proof safe to Salt Lake City.

The power plant consists of five boilers; a 500 H. P. mill engine with high and low pressure cylinders, 22 and 34-inch diameter respectively, with 48-inch stroke; a crusher engine, 14x36 inches; a 12x36-inch dynamo engine which operates a 60 K.W., 500-volt dynamo, by which the mine hoist and stationary motors are operated; besides there is a seven-drill compressor and power for a well-equipped machine shop. As a matter of economy the exhaust steam from the engines is condensed and used to heat the boiler water in a Green economizer, the latter cleansing the water and precipitating the lime and other matter in solution, the water then passing to the boilers at 190° to 200° F., where no boiler compounds are used.

A force of 150 men is employed in the mine and about sixty men at the mill and shops. The sources of the water supply are various wells and springs in Meadow Valley wash, sixteen miles east of De Lamar, where there is a pumping station. In forcing the water from the station to the mine and mill a lift of 1700 feet is made. The entire operations of mine and mill and accessories are under the general superintendence of F. P. Swindler, Wm. Oxnam being mine Supt. and Louis Gross mill Supt.

The April Fool property lies east of the DeDamar, on the same hill, its workings running almost parallel to those of the latter. The April Fool belongs to Butte parties and is in charge of Supt. J. M. Healey. In this mine is a regular vein, between well defined walls. The ores comprise a quartz, bearing considerable free gold, but otherwise quite similar to those in the De Lamar. The development here is by tunnels, which penetrate along the strike of the vein. From the upper tunnel the lowest one is a vertical distance of about 800 feet. These tunnels extend from 2000 to 3000 feet and are connected by chutes and winzes. From a point 2000 feet from the lower tunnel entrance a shaft is being sunk, a gasoline hoist being in use at the collar of shaft. The vein swells to a great width in some places and pinches in others. It dips about 10° from the vertical. A pay streak, from 1 foot to 4 feet wide, is noticeable in the gangue rock. The underground work aggregates four to five miles. In timbering the stull system is used.

The April Fool mill is equipped with Gates crusher, ten stamps, dropping ninety per minute, double discharge, with front and rear plates, effecting a saving of from 20% to 40% of the values by amalgamation. The tailings are carried by sluices to the cyanide leaching tanks, of which there are eight, with two solution tanks. About 160 tons of tailings are in course of passing through the plant. It is stated ten additional stamps are to be put in.

The Mono–April Fool No. 2, interested in which are Geo. C. Fetterman of De Lamar and Frank Knox of Salt Lake City, endlines with the April Fool proper and is in course of development, having about 1200 feet of tunnel work. The vein is said to have been encountered, showing ore that assays well.

The Gold Eagle, belonging to Nesbitt & Hing, comprises two claims, has several hundred feet of development on the vein, said to be a continuation of that of the April Fool. Recent assays showed values of over $80 gold and 200 ounces silver to the ton. The property is bonded to Sanford and others for $40,000, time limit being May 20, 1900.

The Magnolia, north of the DeLamar, has considerable of development and has made some shipments. T. R. Jones and others are interested in the group.

The Little Emma and Hunter claims, four miles north of town, belonging to Roeder, Conway & Thompson, has also been considerably developed, disclosing a fair showing of ore, carrying gold, silver, lead and copper.

The Hercules group, belonging to W. D. Maynard, is well located and has good surface showings.

The Sunbeam, a north extension of the De Lamar, is owned by Dooley, Iseman, McDonough & Docklestich and has a good showing in surface development.

The Boston & De Lamar, owned by Salt Lake parties, parallels the April Food and has a 200-foot shaft and 300 feet of drifting.

The Flagstaff group, owned by a stock company in which the De Lamar Co. have control, is developed by a 400-foot tunnel and other work.

The Monkey Wrench, two miles northwest of town, was the first location in the district. It is developed slightly, having a 100-foot shaft, uncovering native and chloride of silver and some gold.

The Reed tunnel, located near the Magnolia, has several hundred feet of work, with a fair disclosure of gold ores. The claims are owned by McDonald & Co. of San Francisco.

The Millionaire group lies west of town and parallels the De Lamar group. It is said to have ore of an average value of $18 per ton near the surface. This is patented ground and is controlled by Capt. De Lamar.

Southwest of town, on both sides of Cedar wash, are two groups of six claims each, controlled by Hiram Crowell and associates. This is about two miles from the De Lamar and April Fool workings. In the judgment of persons here, the outcroppings of the two properties named are traceable to this locality and are included in a zone 1800 feet wide. The Crowell holdings are of sufficient width to encompass the zone as apparently located. A large number of tunnels, shafts and winzes have been driven on the two groups, and it is said good value is found in a metamorphosed quartzite and in streaks of fluorspar and talc. In this locality the richest ore is next to the porphyry foot wall. The great gouge, described in the De Lamar, appears to be in evidence in the Cedar wash region.

A remarkable fact concerning the entire district is that specimens of quartzite selected at random, almost anywhere on the surface, on being assayed, show gold values to a varying degree.

Several miles southwestward is a conspicuous dry lake, the bed of which glitters with white sand and alkali. This is referred to as an evidence of the unusual aridity of this section. No heavy rains have fallen for years and the snowfall of recent winters has amounted to almost nothing. The stock ranges, as a result, support very scanty feed.

The fuel for all purposes is wood, consisting of cedar, pine and pinon from the hills and higher ranges. The supply is getting farther away all the time, most of it now being hauled from fifteen to forty miles. Most of the mine timbers are of native trees. WASCOTT.

De Lamar, March 12.

WASHOE COUNTY.

Commercial gypsum is now being shipped by the carload from the Mound House.

WHITE PINE COUNTY.

The Ely M. & M. Co. will spend $15,000 in putting in a 50-ton cyanide plant at the Robust mine. Supt. Marx expects to have it in operation Aug. 1.

OREGON.

JACKSON COUNTY.

The proposed High Line ditch is 93 miles long, and taps Rogue river to bring water to a point 400 feet perpendicularly above Gold Hill. It will be 8 feet wide at the bottom, across the top 14 feet, a depth of 6 feet, to carry 10,000 miners' inches of water for operating placer mines and irrigating down Rogue River valley. The contracts are to be let in 10-mile sections. There will be 2000 feet of fluming to be constructed on the line, where the water is to be led across small streams or along steep hillsides upon which the ditch cannot be dug. There are also 2000 feet of 31-inch iron pipe to be laid where the line crosses Trait creek, 25 miles above Gold Hill. The laying of this pipe will save the digging of over 20 miles of ditch, as the water will be carried down one hillside and up the other, where otherwise the line would have to be dug along the face of steep hills.

JOSEPHINE COUNTY.

The Eureka mine on Sailor creek, A. F. Nelson Supt., has been bonded to C. G. Griffith, Gen. Mgr. Montreal & Oregon G. M., Ltd., 52 Broadway, New York City. The reported price is $75,000. The Eureka mine is what is known as the Denver City ledge, with a face width of 30 feet, a pay streak 2 feet wide abutting against one of the walls.

UTAH.

JUAB COUNTY.

The Centennial–Eureka Co. has reduced the cost of transportation between its mine and the railroad from 80 cents to 16.5 cents per ton.

WASHINGTON.

The Britannia Copper Co. has made its final payment on the group of claims on Howe sound, near Vancouver. H. C. Walters says that a smelter will be built at Fairhaven.

WYOMING.

CARBON COUNTY.

Battle Lake is a new copper mining camp in the Sierra Madre range, 10,000 feet above sea level, in the southern part of the county, seventy miles from Fort Steele on the Union Pacific Railroad, connected therewith by a stage line. It is near the northern boundary of Routt county, Colo., and one of a series of mineral-bearing districts in the North Park region—Steamboat Springs, Hahn's Peak and Columbine basin.

FOREIGN.

BRITISH COLUMBIA.

The following are the terms of the agreement submitted by the mine owners and adopted by the Rossland Miners' Union last week by a vote of 218 to 103:

1. That the companies are prepared to open up their mines under the contract system to their full capacity as fast as circumstances will permit.

2. The contract system, putting it generally, provides that the contractors are to be paid for all the work they do, and the companies pay for all the work done, at a price agreed upon and determined by both parties.

3. The two simplest systems will be adopted, viz., (a) contract by lineal foot of hole drilled, and (b) contract by lineal foot of completed working.

4. In stopes the method of hole measurement has been selected because of its extreme simplicity, contractors not being obliged to take any chances on the breaking qualities of the ground or the powder required, the cost of mucking or loss of time from smoke.

5. Blasting will be done, except where otherwise arranged, between the hours of 1 and 7 A. M., so that the probability of loss of time will be reduced to a minimum.

6. As to having all development contracts measured by the lineal foot driven, instead of by the length of holes drilled, it is understood that most of this work will be let by the lineal foot. It would not be satisfactory to contractors or the companies to be confined to this method of measuring the quantity of work done. The method selected for any contract will vary with the mine and the existing conditions, and is a matter of free arrangement with individual contractors.

7. When, through fault of the companies, contractors find themselves obliged to do work not properly included in their contract, the time spent in doing such work, in excess of one hour, will be paid for at the standard scale of wages. When, by special agreement, contractors assume the chances of such occasional extra work the price agreed upon will be made to cover it.

8. The companies will furnish all explosives to contractors at cost from distributing stations, or they will furnish this material free of charge when agreed upon between them and the contractors in any particular work.

9. The companies will furnish all machine drills, tools and implements necessary for the work free of charge to contractors, and no charge will be made to contractors for drilling machines broken while at work.

10. The companies will arrange, as far as practicable, to have all holes in stopes blasted between the hours of 1 and 7 A. M., and they will also endeavor to have all timbering done when required so as not to interfere with the work of drilling.

11. Companies will furnish and pay for the service of engineers and pumpmen when such are required.

12. Mucking or the barring down of rock will be done by the contractors, or the companies, as may be agreed upon at the time of making contract.

13. It is expected that the prices agreed upon, based upon ordinary working conditions, will cover all delays which are inseparable from the incident to mining work.

14. It has been made clear that it is the desire and intention of the companies to afford the contractors every facility for carrying out their contracts to the end that all parties concerned may be mutually benefited.

15. The fact of an employe being a member of the union will be no bar to his employment, nor will the companies place any obstacle in the way of non-union men becoming members of a union.

16. The companies reserve to themselves the right to employ such men as they see fit, whether they are members of a union or not.

17. It is the policy and intention of the companies to treat their employes fairly and not to discharge any employe, whether he be a member of a union or not, without just and sufficient cause, it being clearly understood that membership in a union will not constitute grounds for discharge.

18. With respect to matters wherein the employes of the companies may consider themselves aggrieved the companies will, at any reasonable time, receive a presentation of the case, and consider the same in a fair and impartial spirit and endeavor to remove the cause, where any is found to exist.

19. It is expected that the union will at all times use its good offices and exhaust all conciliatory methods before permitting any strike or stopping of work; and, further, that they will not seek to interfere with the companies in employing or discharging employes or interfere with contractors.

MEXICO.

The El Oro gold mine is 100 miles northwest of the City of Mexico and consists of 174 pertenencias. There are a series of veins embraced in the company's property, the chief of which are the San Rafael and the Branch veins. The former varies from 100 to 150 feet in width, about 30 feet of which only has been worked as the pay streak. The Branch vein will average about 6 feet in width. The ore in sight in the San Rafael vein, to a depth of 225 feet, is estimated at 245,000 tons, averaging $21.88 per ton gross, and in the Branch vein 35,000 tons, averaging $35 per ton gross. The American M. Co. operated a 25-stamp mill and Chilian mill together, equal to about forty stamps, and are reported to have extracted 70,000 tons in the last five years and to have paid $940,000 in dividends, in addition to appropriating about $350,000 out of profits for the equipment of the mine and for the purchase and erection of a 100-stamp mill. This new plant is now in operation, as are also the cyanide works.

SIBERIA.

This consulate is in receipt of a number of letters by each American mail, from all parts of the United States, to the effect that a Russian engineer has recently made a report to his Government, stating that the same gold belt which has proved so rich at Cape Nome, Alaska, extends across the Bering sea into Siberia, and that there are enormously rich quartz lodes in gold mines all over Russia, which are easy to work at a great profit, are owned by the Government, and will be sold to the highest bidder. It is also stated that the Emperor has issued an ukase permitting Americans to prospect for gold on the west coast of Siberia, and that preference is given to American miners and capital to explore the mineral wealth.

These letters inquire as to the truth of these statements, for copies of Russian mining laws, and permits to prospect for gold in Russia, as numerous parties are organizing to take immediate advantage of this opportunity.

I called on N. A. Denissoff, the director of the mining department, yesterday, stated the substance of the articles, and he replied that, although the Government was taking steps to ascertain the conditions on the west coast of Siberia, the Emperor had not issued an ukase on that subject, nor was it probable that he would do so. He said that petitions might be made to the Emperor for permission to prospect for minerals in any part of Russia, which should be accompanied by recommendations as to the character of the applicant, his experience as a mining engineer, capital to be employed, etc., and it would be considered; but the best informed people here do not believe permits could be obtained to prospect for gold on the west coast of Siberia until after the Russian Government has fully investigated its conditions. Were it ready to consider such applications, the probabilities are that it would require from two to three years before the same would be finally decided. Russian officials place no value

all the intermediate levels, by means of on time, and it requires from two to twelve weeks to receive an answer to an official communication from the various departments, according to the work involved in the reply.

The value of Russian gold mines has been greatly exaggerated. Several experienced American mining engineers, who are admitted to be the best in the world, have visited Siberia in the interests of English as well as American capitalists during the past three years and made extensive examinations of the conditions, and I have not heard of a single company being organized as a result of their reports. The mining is almost all placer, there being but two small quartz mines in the Ural mountains, which are owned by French capitalists and are said to be losing money.

There is very little foreign capital in Siberia. No advantages are offered to or discriminations made in favor of Americans engaging in any kind of business in Russia.

W. R. HOLLOWAY,
Consul General.

St. Petersburg, Feb. 13, 1900.

SOUTH AFRICA.

The annual report of the Chamber of Mines of the South African republic for 1899 is necessarily incomplete in regard to most of the mines after August. The output of gold by the Witwatersrand mines amounted to 4,008,325 ounces; for outside districts, 187,635 ounces; total, 4,195,960 ounces. The returns in gold per ton of ore were: Mill, 6.41 pennyweights of fine gold; tailings, 4.07 pennyweights; slimes, 2.01 pennyweights. With the returns from concentrates and by-products, the total yield per ton of ore crushed was 10.10 pennyweights, of the value of 41s 3d, the weight being a trifle higher but the value the same as in 1898.

SPAIN.

The twenty-seventh annual report of the Rio Tinto Copper Co. for the year ending Dec. 31, 1899, shows:

	1899. Tons.	1898. Tons.
Copper produced	20,230	20,426
Copper in pyrites shipped	14,587	13,456
Totals	34,817	33,882
COPPER SALES.		
Refined copper	16,893	18,612
Copper in sulphate	1,067	981
Copper in pyrites	14,139	13,502
Totals	32,099	33,095

The average copper contents in the pyrites was 2.719%, against 2.852% in 1898 and 2.810% in 1897. The quantity of pyrites invoiced to consumers in England, Germany and the United States was 636,323 tons, against 618,110 tons in 1898, 582,540 in 1897 and 514,585 in 1896.

THE KLONDIKE.

The Canadian government has decided to sell at auction all the placer mining claims that it has reserved. Gold Commissioner Senkler says the sale will be held on June 1, 1900.

Personal.

JOHN GILLIE is the new Supt. Butte & Boston mines at Butte, Mont.

T. F. SINGISER is Gen. Mgr. Salmon River G. M. Co.'s mines, Salmon City, Idaho.

EDWARD MCKINLAY, has resigned as assayer at the Providence, Nevada Co., Cal.

W. J. CLARK, foreign Mgr. General Electric Co., sailed for England on the 9th inst.

W. S. HASKINS, Supt. Nickel Plate mine, Rossland, B. C., returns from San Francisco next week.

COL. E. D. BOYLE, an old Comstock miner, now managing Nevada county, Cal., properties, is visiting San Francisco.

M. L. VIRDEN, formerly with the Standard Con. G. M. Co. of Bodie, Cal., is foreman at the Hathaway mine, Newcastle, Placer county, Cal.

HENRY BRATNOBER is credited in Juneau, whither he returns next month, with having "cleaned up $3,000,000 in stocks while operating in the London markets during the past winter."

COL. BERNARD PEYTON has resigned the superintendency of the powder works at Santa Cruz, Cal., and, after an extended sojourn in Germany, will return to San Francisco to probably engage in a similar enterprise.

Industrial Notes.

—Over $5,000,000 will be spent by the Union Pacific in improvements in Wyoming this year.

—During '99 San Francisco imported about 1,750,000 tons of coal, of which fully 80% is consumed for steam uses, viz., 1,392,000 tons.

—Gondolas in Venice are now run by American electric motors, American bridges cross African rivers, American locomotives wake the echoes of Jerusalem and speed across Siberia.

—In Santa Clara county, Cal., the Standard Electric Co. expects to have its poles and wires from Blue Lakes to Alviso by May 20th. That point is to be the distributing point for lines running to San Francisco, Oakland and San Jose. This company proposes to transmit power 150 miles. The longest present transmission is Redlands to Los Angeles, 85 miles.

—The quantity of coal carried on the Soo canal, between Lakes Superior and Michigan, has increased from 80,815 tons in 1872 to 3,940,887 tons in 1899. Coal from the Pennsylvania and Ohio fields is supplied at low freight rates to the Lake Superior region, where coal production is light and fuel greatly in demand, as the vessels which carry the iron ore, grain and flour from the Lake Superior region carry coal on their return trips at nominal freight rates, and, as a consequence, the coal passing through the Soo canal has increased from 80,815 tons in 1872 to 3,940,887 tons in 1899. The iron ore shipments through the canal increased from 383,105 tons in 1872 to 15,328,240 tons in 1889; copper, from 14,591 tons in 1872 to 120,090 tons in 1899.

Catalogues Received.

Improved Steam Pumps, 96 pp., finely illustrated and descriptive of practical pumps for all possible service, carrying considerable condensed information to users of such apparatus. It will be sent to any address upon request by the Union Steam Pump Co., Battle Creek, Michigan.

"Fourteenth Annual Catalogue Engines and Boilers," 56 pp., handily indexed, portraying and describing engines and boilers, with colored sectional and shop drawings of setting, full flush front, one-half arch front. Sent upon application to C. O. Bartlett & Co., 43–45 Center St., Cleveland, Ohio.

Catalogue No. 13 of the Union Gas Engine Co., out this week, is fully up to its predecessors, which is saying a good deal, and gives detailed illustrated description of the "Union" marine and stationary gas and oil engines, all the illustrations being from photos of engines and boats in actual use. It will be sent on application to the Union Gas Engine Co., at their new address, 244–246 First St., San Francisco, Cal.

The Foos Gas Engine Co., Springfield, Ohio, furnish an artistic catalogue, No. 9, of their builds of high-grade gas and gasoline engines, 1½ to 250 H. P., adapted to all power purposes, which gives accurate description thereof, accompanied by unusually fine illustrations. A copy will be sent on application to the home office, or to the Pacific Coast Agency, American Manufacturers' Association, 20–22 Fremont St., San Francisco, Cal.

Books Received.

"A Practical Course in the Fire Assaying for Gold, Silver and Lead of Ores, Bullion and Metallurgical Products;" 184 pages, suitably arranged for the use of students; practical, clear and up to date; written by Ernest H. Simonds, 521 Sacramento St., San Francisco, to whom all inquires should be addressed. It is a work that could be read with profit by any assayer, mill man or metallurgist. Much of it is new, and all of it is good.

"The Gas Engine Hand-Book," by E. W. Roberts, M. E., published by the Gas Engine Publishing Co., Cincinnati, Ohio; 220 pp., 12 mo.; twenty-five chapters of gas engine practice, telling how to set up and run a gas engine, care thereof, different styles and types, the arrangement, and mechanism, formulas, testing, tables—a general compendium of information on gas engines. Illustrations and contents are mainly original, the advertising feature is absent, the idea being to give expert advice as to gas engines in general.

Commercial Paragraphs.

THE Calumet & Hecla is going to place twenty-four Wilfley tables in its stamp mills.

THE Denver, Colo., agency of the Jeffrey Manufacturing Co. is located at 543–544 Equitable Building.

HENRY E. WOOD will soon install a new Edison-Wetherell magnetic separator at his ore-testing works in Denver, Colorado.

F. A. HUNTINGTON has shipped two roller mills to the Montezuma Copper Co., Naco, Arizona, and one to Carrville, Trinity Co., Cal.

THE Link-Belt Engineering Co., Philadelphia, Pa., has closed a contract with the Lackawanna Railroad for a coal storage plant to have 100,000 tons capacity, at Scranton, Pa.

THE Rand Drill Co., New York City, has a contract for an air compressor for the Hartford mine, near Negaunee, Mich., and for compressors for the Quincy M. Co. and the Adventure Con. M. Co.

CONSOLIDATION of the American Air Power Co. of New York and the Compressed Air Motor Co. of Chicago is announced under the name of the Compressed Air Co., $8,000,000 capital, H. D. Cooke, Pres., C. H. T. Collis, Vice-Pres.

THE Sullivan Machinery Co. of Chicago has supplied fifteen machine drills to the Ibex Co., Leadville, Colo., seven to the Elkton Con. G. M. Co. at Elkton, Colo., three to the Iron Silver mine at Leadville, Colo., and to the Victor Fuel Co., for their Hastings mines, two Mitchell room and pillar electric under-cutter machines.

THE Standard M. & S. Co., Colorado City, Colo., will have the entire machinery for its chlorination mill, capacity 300 tons per day, built by the E. P. Allis Co., Milwaukee, Wis. It will be virtually a duplicate of the mill owned by the Colorado-Philadelphia Reduction Co., built by the Allis Co. at Colorado City four years ago. The new mill is expected to be ready for operation by January 1, 1901. Electric power will be used throughout.

THE Hampton zinc lathe, manufactured by the Pacific Tank Co., 35 Beale street, San Francisco, and 348 E. Second street, Los Angeles, Cal., is commended to the attention of any and all who turn out zinc shavings for precipitating gold from cyanide solution, its economy in operation making it a necessary adjunct of every cyanide plant. It is figured that the cost of furnishing 100 lbs. of zinc shavings by the Hampton zinc lathe is $129, as compared with $210, cost of operation of old style.

THE Rix Engineering & Supply Co. of San Francisco has an order from the Morning mine, Mullan, Idaho, for a 100-drill compound air compressor, to be driven by what is described as the largest tangential water wheel in the world—a Pelton wheel, about 32 feet in diameter, weighing 30,000 pounds—in the center of the main compressor shaft. On this wheel will be utilized two heads of water, operating from two nozzles, one head of water being 1320 feet and the other 1150 feet. The diameter of the wheel is a mean between the requirements for the two heads. On either side of the main water wheel are two 11-foot wheels, operating under a 140-foot pressure. The revolutions of the water wheels will be eighty—a high rim velocity for the wheel. The compressor will be of the duplex tandem type—two low-pressure cylinders and two high-pressure cylinders. All of the valve gearing on the compressor will be of the Corliss type, each valve on the machine to be operated by its independent eccentric, and thus be under independent control. The air transmission will be through about 10,000 feet of 12½-inch pipe, and from the end of this pipe, making two branches, the longer one of which will be 15,000 feet, making about five miles of transmission. The entire plant, with pipes, erected, will cost about $150,000.

CHAS. C. MOORE & CO., 32 First St., San Francisco, Cal., have recently opened an office at 313 First Ave. South, Seattle, Wash., and are making a specialty there, as well as in San Francisco and Los Angeles, of high grade steam motive power and hydraulic machinery, furnishing power plants for electric lighting and street railroad work, mills and factories. They have contract for and are now installing the 10,000 H. P. plant, complete, for the Independent Electric Light & Power Co., San Francisco, to be the largest power station west of Chicago. A 4000 H. P. McIntosh & Seymour engine was recently sold by Chas. C. Moore & Co. to the Seattle Electric Co. They are putting in the complete power plant for the Honolulu Rapid Transit & Land Co.—the new electric street railroad in Honolulu—this latter plant about 1500 H. P., compound Corliss direct connected units. They are also putting in the electric station at Santa Monica, to furnish light and power to Santa Monica, Redondo, San Pedro and Long Beach, Cal. They have contract for and will install in the Matsqui district, for the Government of the Province of British Columbia, two centrifugal pumping plants with capacity of about 30,000 gallons of water per minute each. These pumps are to be driven by Corliss condensing engines, Babcock & Wilcox boilers, with complete equipment of American-made auxiliaries. Besides the Seattle and San Francisco offices they have offices at 103 South Broadway, Los Angeles, and at Honolulu, Hawaii, U. S. A.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TIRE HEATER.—E. Beeson, Fresno, Cal. No. 646,567. Dated April 3, 1900. The object of this invention is to provide a means for heating tires which are to be afterwards applied to vehicles. It consists of a shell with outwardly and upwardly divergent conical inner surfaces upon which the tire may be laid with suitable supports, a furnace for producing the heat, a flue connecting the furnace with the apex of the shell so the heat is discharged and directed along the floor of the cone and into contact with all parts of the tire. This guide or directing device is in the form of a second cone which lies above the tire and forms an annular conical space through which the heat is directed. Above the hole is a vertically movable conical cover or cap which fits over the lower one and there are counterweights and chains passing over suitable pulleys so that this portion can be raised to place the tire and depressed after the tire is in position. The device is so arranged that

This Paper Fifty-Two Times, POST PAID, $3.00

tires of any size can be heated therein, and provides for a great economy of fuel and a rapid heating.

COOLING AND VENTILATING ATTACHMENT FOR CARS OR VESSELS.—G. A. & R. F. Dunn, Dinuba, Cal. No. 646,522. Dated April 3, 1900. This is an invention for ventilating cars, vessels and other movable structures. It comprises the outer car body or wall and an interior wall of burlap or other fibrous material interior to the main walls and forming an interspace between the outer and main and the inner or burlap wall. Suitable passages are provided with movable directing gates or valves and are made adjustable at the front end of the car so as to direct air into the space between the outer and inner walls, and screen cover openings are also made with devices by which either may be closed or opened. A tank of water situated in the upper part of the cars serves to keep the burlap wall moistened and the air which is driven into the space between the two walls by the motion of the cars is compressed and forced through this burlap wall into the interior of the car in a clean cool condition.

RAILWAY SIGNALS.—No. 647,097; April 10, 1900. John Jorgenson, San Francisco, Cal. This invention relates to a signaling device which is applicable to lines of railway wherever it is desirable to employ a signal, and particularly at the crossing of such lines. It consists of a signal including a concealing casing and a globe, one movable with relation to the other, with means for operating the signal comprising a vertically disposed solenoid, a weighted core movable into and out of the solenoid, a cord passing therefrom over a journaled drum, a corresponding cord passing over a second drum upon the same shaft connecting with the signal, so that the energizing of the solenoid will act to raise the signal and a latching device by which it is retained in its raised position after the solenoid has been de-energized.

MECHANICAL BILL-CARRYING APPARATUS.—A. W. Thierkoff, Redding, Cal. No. 646,509. Dated April 3, 1900. This invention is designed for the convenient arranging and posting of bills and the like. It consists of a desk having a hollow drum journaled and rotatable within the desk, and a sliding cover which is opened to expose the drum and closed and locked when not in use. The drum revolving within the desk thus constructed has slots made longitudinally through its periphery, and spring clamps are so mounted with relation to these slots, that a large number of bills may be conveniently carried upon the drum. The drum can be properly indexed to correspond with the ledger index, and there are openings through which the bills may be inspected or reached at will. Several bills can thus be arranged in one line depending on the length of the drum, and a number of slots will allow a large number of separate independent accounts which can be always easily reached.

Recently Declared Mining Dividends.

Vindicator Con. M. Co., Colorado, 5 cents per share, $53,250	April 25
Mary McKinney M. Co., Colorado, 6 cents per share, $60,000	April 13

If you are going to
CAPE NOME
Send for our Catalogue describing the
PNEUMATIC PROSPECTOR.
SIZE, 6x 11x 14 Inches.

WEIGHT, ONLY TEN POUNDS.
——AND THE——
PNEUMATIC SEPARATOR.
Weight, 160 lbs.; capacity, 15 to 30 tons per day.
These machines save the gold WITHOUT THE USE OF WATER, enabling the miner to thoroughly prospect on the spot and successfully work the rich benches and gulches, when water is not convenient. The separation is accomplished by graduated air current. These machines are especially adapted for saving flour and beach gold. No quicksilver being used, the iron-coated beach gold of Cape Nome, so difficult to amalgamate, is saved with these machines as easily as though the gold was clean. Send for descriptive circulars.

The Third Edition of Parts II and III of this great work on assaying is now ready; new type; new illustrations; new matter; better than ever; reduced in price to $1.50 postpaid to any part of America. The practical character of this book has made it the favorite everywhere in the mining world among men who want such a manual on assaying.
Address Book Dept. Mining and Scientific Press,
330 MARKET ST., SAN FRANCISCO, CAL.

SMOOTH-ON CASTINGS.
An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.
MESSRS. MADISON, BRUCE & SELLERS,
34-36 STEUART ST., SAN FRANCISCO, CAL.....AGENTS FOR PACIFIC COAST.

The Best Yet!
That is what they say about our new Jackhead Plunger Pump. Especially adapted for pumping very muddy or gritty water.
No smooth cylinder to wear.
Seldom requires packing.
Forces water on the down stroke, consequently no balancing bob required.
Water column can be perfectly and inexpensively balanced.

Correspondence solicited. Tell us your conditions and we will quote you on size and kind of pump that will suit you best.

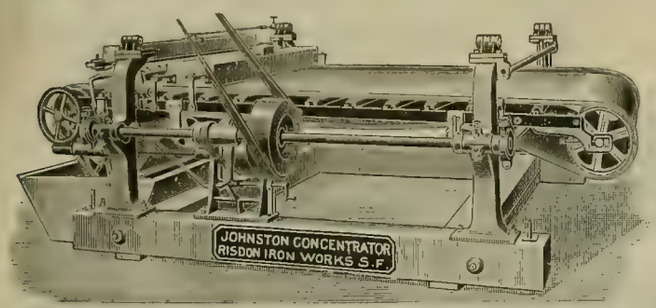
THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.



FOR PARTICULARS, WRITE TO

AGENTS.

The JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Cheaper Way of Sending Circulars.

SOME firms dealing in mining machinery occasionally issue circulars that are supposed to be distributed by mail, mostly to men who moved from the place a year ago. Many business men understand what a waste of money is always involved in issuing circulars—whether distributed by hand or sent by mail; but while it is evident that those who get out circulars really want to advertise, it is apparent that they don't know how to get at what they do want. As there appears to be a few (mostly believers in "mining directory" lists) who still think that a circular is a good thing and forget that the circulars that they send out, even when received, are always accorded the same fate that they themselves give to any circular that they receive, namely, throwing it away unread, it is deemed advisable to suggest to them a way in which they can have their circulars do them some good.

To those who have mining machinery for sale, or who want to reach the mining world, and feel disposed to cling to the ancient notion of circulars sent by mail at random to probable or possible customers, it is suggested that they can, without doing violence to their established notions, secure better results in a better way. The following tells them how it can be done, being an illustration of how to do effective circular work at a greatly reduced cost. There are very few circulars that contain more than can be prominently displayed in one page of this paper.

9,000 good circulars, well printed on fine paper, would cost	$35 00
Envelopes for same	8 00
Addressing them	7 00
Postage (sealed envelopes)	180 00
Total	$230 00

Thus we find that to get 9,000 circulars as far as the postoffice would cost $230. This is on the supposition that the 9,000 names to whom the circulars are addressed are those of men likely to be customers of the concern sending the circulars, which is very improbable, as no one firm can secure a live list of possible customers that would equal in value a list containing the same number of subscribers of a good, live paper that is bought and paid for, and seen every week, and passed around until in many cases it is worn out from the number of readers through whose hands it goes. Now, instead of spending $230, which is mostly thrown away, how would it do to take the same circular and put it on one page of the MINING AND SCIENTIFIC PRESS, the cost of which in place of $230 would be $42, or less than one-fifth of $230, with a hundred times the greater likelihood of value? The manufacturer or dealer in mining machinery who will spend $230 in an attempt to get his business before 9,000 people could save $188 by putting that same circular on one page of this paper, and besides would be sure to get it before 9,000 definite, known, men, thus securing a certainty instead of an uncertainty, and at less than one-fifth the cost of the old way.

If a circular is so good a thing as some seem to imagine, here is a chance for them to get what they want at less than one-fifth what it would cost them by the old way, and with certainty of result.

(In figuring on the cost of these circulars it is assumed that each one is sent sealed, which involves a two-cent stamp, but even were they sent unsealed they would still cost one cent apiece for postage, which would make them cost $140.) Herein we show how lovers of circulars can substitute certainty for uncertainty, and at much less cost to themselves. The force of these remarks lies in their personal application.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

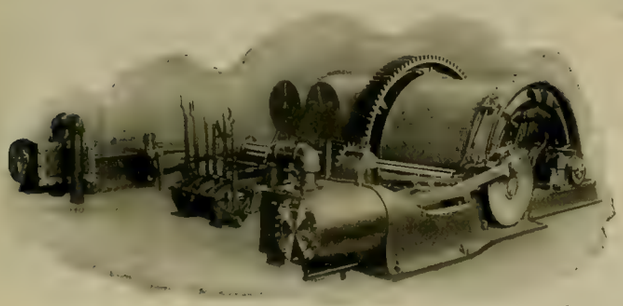
THE GRIFFIN
THREE ROLLER
ORE MILL.



The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

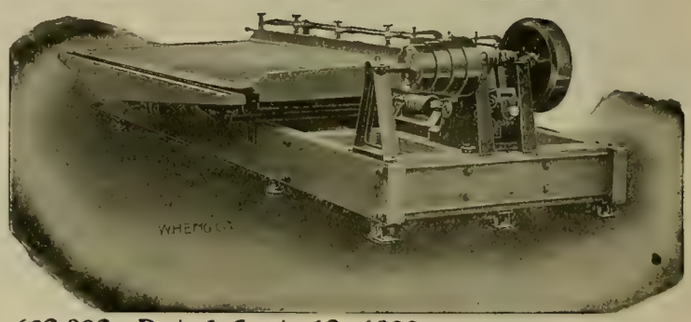
Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.



(SEE PAGE 449)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of April, 1900, an assessment (No. 23) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of May, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 28th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of April, 1900, an assessment (No. 70) of fifteen (15c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 31st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of April, 1900, an assessment (No. 16) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of June, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

OSCEOLA CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1900, an assessment (No. 9) of one (1c) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of April, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, Cal.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of March, 1900, an assessment (No. 2) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of April, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on MONDAY, the 14th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN F. BARNETT, Secretary.

Office—Room 22, No. 222 Sansome St., San Francisco, California.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY, SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL. EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

MINING AND SCIENTIFIC PRESS.

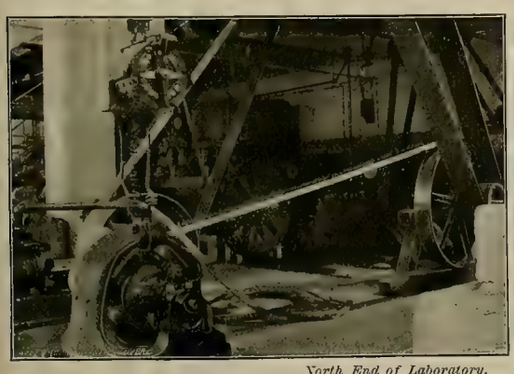
AND PACIFIC ELECTRICAL REVIEW.

No. 2075.—VOLUME LXXX. Number 17. SAN FRANCISCO, SATURDAY, APRIL 28, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Personal Care Necessary, Too.

Suggestion comes from Montana that this paper direct editorial attention to the necessity of safeguards and requirements by law looking to the care and protection of working miners. The idea is in order, and is in line with numerous utterances in this and other publications from time to time in that direction. The hazardous nature of mining work and the fact that in underground employment one's safety depends so largely upon the action of others makes this subject one of continued vital interest to every miner. But it is also to be observed that no amount of legal or statutory requirements will take the place of the necessary precaution required of the miner himself. The writer has seen miners do most hazardous things, and is not altogether free from memory of taking some chances himself when working underground. It would seem as though familiarity with danger makes one careless, and in connection with this subject it is in order to say that the personal equation is after all the most important. If a man won't look out for his own safety he can hardly expect others to do it for him. A large proportion of the accidents in mines is caused by carelessness or disregard of the plainest dictates of safety, and it is often the foreman or superintendent of the mine who sets an example of recklessness that is followed by equal foolhardiness on the part of his men. Of course the writer well understands that no miner in any position of importance likes to appear too cautious or timid, but, yet, it is better to be foolishly careful than carelessly foolish.

An instance will illustrate: Last week, Robert Rowland, the master mechanic at the Logan mine, Victor, Colo., went down the shaft to inspect the connecting sets. It was his place to let the engineer in charge of the hoist, or the surface man, know of the work he was going to do. This he neglected. He was standing on a dividing piece in the compartment when the cage descended on him. He hadn't time to jump, and had to catch on or fall 200 feet. The first contact of the cage caught and broke both his arms. He fell, but grabbed the guides; then the cage caught him again and tore the flesh off his legs. Then the carpenter managed to get him loose.



This is sufficient to illustrate the point taken. Experienced miners too often disregard the plainest requirements of safety, and even when legal enactment compels the observance of sundry regulations they have been known to disregard them. In Montana the Legislature passed a law requiring mine owners and operators to case in the shaft cages as a measure of safety to the men. In five months after the law went into effect there were six fatal accidents in the vicinity of Butte, resulting from non-compliance with the law, and the defense of the mine managers at the inquests was that "the miners preferred to ride in the old-fashioned cages," which in law was no defense at all and yet had some truth in it. In the last case noted the coroner's jury verdict was that the death of the man was "the result of his own carelessness." Of course much remains to be done to make safer the ordinary daily duties of the working miner, and everything necessary should be urged; but on the miner rests much of this duty—a duty too often ignored or disregarded.

Latest Mining and Metallurgical Patents, 463. Some Observations on Practice of the Cyanide Process at Mercur, Utah; The "Hula Hula" Rocker, 464. Industrial Notes; Personal; Recently Declared Mining Dividends; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 467-468.

THE secretary of the International Mining Congress asks for announcement that the third session will be held at Milwaukee, Wis., on the dates originally set—June 19–23. A large attendance is expected.

CALIFORNIA oil is now being refined and used for illuminating purposes, though the product is inferior; the process of refining includes mixture of 50% Pennsylvania oil, which has a paraffine base, as distinctive from the asphalt base of the California oil. Experiments continue with the lighter California oils in hopes to produce a smokeless illuminant, but so far without success. Chemically, the introduction of nascent hydrogen would tend to obviate the difficulty, but in a commercial sense this would not be feasible.

THE circumstances and surroundings of a mine or mining region often have more to do with its prosperity than the intrinsic value or richness of its ore. This factor enters into "mine values" and the report of a mining engineer. In one locality $30 ore may be low grade and profitless; in another more favorably situated as regards transportion, mills and main centers, $10 ore will be of value. The prominence that Colorado deservedly occupies is largely because of the admirable system of railways in that State, penetrating anywhere and everywhere that there are any indications of mineral wealth. In Colorado the railroad keeps just behind the prospector. In California, with one railroad and no competition, the one railroad ever silent to the State's mines, many a deserving locality continues too inacessible for hope of profitable working.

IN California electrical transmission enterprises, projects that a few years ago would have been deemed chimerical, are now matter-of-fact commercial accomplishments. In the southern part of the State is an electric power plant, transmitting a 33,000 voltage 85 miles. The Standard Electric Co. now proposes to transmit the electrical equivalent of 14,000 H. P. 150 miles. This company now has 500 men engaged in preliminary work, and the main features of the enterprise are worthy of special note even in these days of gigantic electrical transmission schemes. The wire to be used is of aluminum, having about 60% of the conductivity of copper, weighing one-third as much and costing less. It will be in the form of cables, twenty-seven strands of twisted wire to each cable, which will be three-fourths of an inch in diameter and will weigh one and three-fourths tons to the mile. The company furnishing the plant guarantees a delivery of 84% of the power generated. Another novel feature is the high head of water—1465 feet. A notable feature will be the use of storage batteries—the first of the contemplated magnitude in California. There will be three main trunk lines and three cables in each line. The company expects to have the entire line built and in operation this year.

Alien's Rights to Unpatented Claims.

Numerous inquiries regarding the rights of aliens to locate mining claims in the United States are received. Request is made for authoritative statement as to how matters stand in Cape Nome as to mining locations made by aliens. The matter merits notice, and in the following is exact statement of legal fact concerning this question at Cape Nome or anywhere else in U. S. territory. It answers all the questions asked as to present existing facts.

The United States mining law, in terms, confines the right of location of mineral lands to citizens of the United States, or those who have declared their intention to become such. It does not necessarily follow that the acquisition of an unpatented mining claim by an alien, either by purchase or location, is void. On the contrary, the title of an alien to such land is only voidable and while of record in the alien the land covered thereby is segregated from the public domain. A claim so held does not, ipso facto, escheat to the Government, and third parties cannot invest themselves with the right of the Government to the extent of dispossessing an alien of his holdings. The question of alienage cannot be raised collaterally, because the paramount title to the land is in the United States, and a third party has no right to complain, in a collateral proceeding, if the Government does not enforce its prerogative. This doctrine is supported by Section 910 of the United States Revised Statutes, which is as follows:

"No possessory action between persons in any court of the United States, for the recovery of any mining title, or for damages to any such title, shall be affected by the fact that the paramount title to the land in which such mines lie is in the United States, but each case shall be adjudged by the law of possession."

The question of the right of an alien to hold an unpatented mining claim must therefore be determined either in proceedings instituted by the Government, technically termed "inquest of office found," or in proceedings based upon an application for patent. In a suit adverse to such an application the question of the alienage of either party to such suit may be raised in the trial court by either of them as in right and on behalf of the Government; or, further, by the Land Department in the due course of the patent proceedings upon its own motion, or at the suggestion of a third party, who need have no direct interest in the matter.

The question being properly raised, its effect may be avoided by the naturalization of the alien at any time before judgment in judicial proceedings or final action by the department in patent proceedings, as naturalization is of a retroactive effect, so as to be deemed a waiver of all liability to forfeiture and a confirmation of title.

In other words, an alien claimant can hold as against all the world save the Government of the United States, and even as against the Government itself until divestiture of title is had in due and proper proceedings in a court of competent jurisdiction or in the Land Department. In the latter case, however, action can be taken only when it is sought to secure patent for the land, as that department has no official information of the existence of a mining claim until patent is applied for.

Hence, a mining claim located by an alien is not subject to relocation merely because of such fact; neither does the transfer of an unpatented mining claim to an alien, which was located or held by a person competent under the express terms of the mining law to appropriate or hold the same, work an abandonment of such claim; nor is the title of a qualified person to such property affected by the fact that his title was derived from an alien locator, provided that in making the location the latter complied with the statutory law and the local rules and customs necessary to make the location, and has maintained the claim by due representation thereof until the time of its transfer to the citizen.

TELEGRAPHIC ANNOUNCEMENTS of "a great strike," or that So-and-So have "refused $500,000" for their property, are to be occasionally discounted. They are frequently paid for. The fact that those items so appearing in the daily papers are marked "by telegraph", with the name of the town and the date line, is only a part of the deception. A leading advertising agency announces its ability to get "anything" published, marked "by telegraph", and having every appearance of a news item—in the daily papers—if paid enough for it. Quite often this is done, and occasionally "mining news" strays in to a daily publication that way.

A Mine Trust.

Some weeks ago a short editorial herein commented on existing conditions in gold mining that made the industry exceptionally profitable when intelligently conducted. The paragraph when copied by various publications was usually supplemented by the apt comment that the showing made was conducive to the formation of a trust in gold mining as in other lucrative pursuits. From appearances in Colorado it would seem as though such suggested trust were in actual process of formation. Recent transfers of mining properties in the Cripple Creek district indicate the gathering in of valuable properties and their consolidation in one gigantic ownership. The argument the buyers act on is that if those mines are so profitable under present forms of management they can be made manifestly more so by doing away with litigation, so prevalent between contiguous owners; by reducing the number of managers, superintendents and other officers; by building larger reduction plants in which the same economy of operation shall prevail; and, in general, by enhancement of values of stock in such mine "trust." Without direct avowal of the formation of such a "trust" or combine, every recent move in that locality indicates the virtual formation of such consolidated ownership. The situation in Cripple Creek is peculiarly favorable to such combination. At bottom the same possibilities of economical operation afforded in the smelter "trust," the steel and wire combine, or the department store, appeal to the would-be investor in the stock of such a concern. The cases are not, however, strictly parallel. Trusts can never control in the mining world. Causes and circumstances will constantly favor the individual miner and constantly create conditions that will in general inure to private ownership or separate corporate control, the tendency in that regard being to disintegrate rather than cohere. Here and there the "trust" principle may prevail. This is an era of big enterprises. Whether it be a mine or a factory, a bank or a store, the economical carrying on of the business is often rendered possible only by the aggregation of capital, and great enterprises that could not be started, much less continued, by the individual, are pushed and made permanently profitable by the combined investments of the many. But it is manifest that no trust can live long unless it secures exclusive control of the commodity dealt in; and it is equally manifest that no aggregation of capital could control the gold production of even any one region or district. So that in the domain of gold mining there is little likelihood of a "trust." Current Colorado action as regards smelter trust charges shows that that combine can not control; much less could a combine of mine owners for trust purposes. After all, the only people who have reason to fear trusts are those who trust them. Meanwhile any action that makes two producing mines where there was but one is of help all around. The consolidation of big Cripple Creek properties under one management can not be made to take on the essential attributes of a "trust;" nor can the same conditions that make trusts possible be maintained anywhere in the mining world.

A Commercial Endorsement.

The Transmississippi Commercial Congress, which met at Houston, Texas, last week, passed the following resolutions:

Resolved, That the mining industry in the United States has attained such vast proportions that it is entitled to due recognition from the national Government, and we advocate the establishment of a Department of Mines and Mining similar to the Department of Agriculture, not only as a proper recognition of existing conditions, but because of its importance to the future development of this growing industry.

Resolved, That we request of the Congress of the United States the prompt passage of Senate bill No. 3109, introduced by Senator Chauncey Depew, entitled "a bill to promote and encourage the mining, mineral and metallurgical sciences of the United States."

Concentrates.

TO RETORT foul quicksilver is the most effective way to clean it.

NO. 13, issued in 1896, was the last of the California State Mineralogist's reports.

AQUEOUS SOLUTIONS of cyanogen do not exert any solvent action on gold or silver.

NEVER run to a fight nor from it, is a fair rule regarding mining litigation and other things.

"GIANT" powder is 36 parts nitro-glycerine, 48 nitrate of potash, 8 sulphur, 8 resin or charcoal.

FROM the Con. Cal. & Virgina mine, on the Comstock, Nevada, were extracted 119 tons of gold.

THE Hendrie & Bolthoff Mfg. Co., Denver, Colo., make and supply a good powder thawer.

OIL WELLS have been drilled by electricity, notably in Indiana. The scheme is quite practicable.

THE interest of an expert affects the weight, but not the legality, of his testimony in a mining case.

AT the Golden Cross mine, Hedges, Cal., wood has been sold by weight—$4 per ton of 2000 pounds.

THERE were fifty-three issues of this paper in '98. The phenomenon will not occur again until 1910.

LAKE SUPERIOR COPPER is largely native; Western copper is reduced, electrolytically and otherwise.

DIRECT connected air compressors are in active use in various mining plants in Colorado, California and Utah.

THE highest salary paid to any Klondike examiner was $25,000, to Aug. J. Bowie by James R. Keene, for one year's engagement.

TELLURIUM occurs in isolated instances in Montana. It has been found in an oxidized form at the Mayflower mine, Madison county.

TO REDUCE a 1% cyanide solution to ¾ of 1% use three ounces solution to one ounce water; to ½ of 1%, two ounces solution to two ounces water.

THE El Plomo Co., treating free-milling ore in Costilla county, Colo., has a record of mining and milling the ore at a total cost of $1.32 per ton.

LITHIUM is the only substance with which nitrogen will directly combine at ordinary temperature. It is the lightest metal known—sp. gr. 0.59.

THE record for longest distance ever encompassed by unaided human vision is 183 miles between Uncompahgre Peak, Colorado, and Mt. Ellen, Utah.

WITH proper dredging appliance intelligently operated, gravel ground that fairly prospects 5 cents to the square yard is susceptible of profitable working.

A CORPORATION seeking patents to mining lands must comply with the corporation laws of the State where the property sought to be patented is located.

MEN who figure on those things say that, as compared with thirty years ago, 40% more gold can now be extracted from the same ore at a less cost of 40%.

A PLACER MINING CLAIM in the United States of Colombia, S. A., may cover five square kilometers. Title thereto costs about $200 Colombian money.

A DESCRIPTION of the Calumet & Hecla mine, Lake Superior, Mich., with illustrations drawn and engraved especially therefor, appeared in the issue of Nov. 13th, 1897.

IT is held by Dr. Becker and other geologists that the gold of the Rand, South Africa, is of marine placer origin, and is not the result of precipitation or impregnation.

IN Idaho, generally, the percentage of gold in the ore increases with depth; ordinarily, in Nevada, the percentage of silver in the ore is greater as greater depth is attained.

IN law a bank can not act as treasurer of a corporation, because that involves personal liability. A bank may be designated as a depositary, but its functions are commercial.

THE first census of California was in 1852. El Dorado county was first in population, 40,000; San Francisco second, 36,154; Nevada county third, 20,583; Calaveras county fourth, 20,183.

WOLFRAMITE or tungstate of iron occurs at Murray, Idaho, in scheelite parallel with a vein of gold quartz, and in the Arivaca mining district in southern Pima county, Arizona, alongside a similar formation.

AT Parnschowitz, near Rybuck, Upper Silesia, a bore hole has been sunk 6573 feet, which is believed to be the deepest of the kind. At the beginning the bore hole was 12 inches diameter; at the bottom, 2¾ inches.

"BETA" is a product such as occurs in an alloy or steel which by water-quenching at a suitable temperature has been rendered so hard that it will scratch glass, or form the edge of a tool or other cutting instrument.

THE use of vaporized mercury in amalgamation processes is not deemed advisable, because it ordinarily involves what appears to be unnecessary work and expense, and is apt to occasion salivation of the operators.

EFFORT has been made at various times to have it seem as though the California Miners' Association endorsed some publication or backed some paper, but the executive committee, which alone possesses such power, has always sensibly declined to have any "organ" or special publication represent it. Any claim to public patronage so based is fictitious.

BUSINESS should be broadly considered as a matter of principles, not solely a series of transactions. It is not a mere matter of present barter, of bargain and sale, but with a view to future conditions and greater possibilities.

POOR ROADS constitute a present great drawback to the development of a mining district, and no matter how old or how valuable, the fullest measure of profitable working cannot be compassed in any district so handicapped.

STRONTIANITE, or carbonate of strontium, is not uncommon in Oregon and California, but there is no market for it. It can be brought from Europe, if required, at less than $5 per ton. It is used for making red fire and fireworks.

CHROME ORE has long been used for furnace linings. It is not necessary that it be made into bricks. The ore may be crushed into pieces the size of a pea, mixed with tar and the furnace lined as though with mortar or cement. In use the tar burns away, leaving a solid chrome lining.

CARBONS in diamond drills cost about $16 a carat—.206 grains. Six stones of three carats are used to a bit. It costs $10 to set a bit, making a total cost of about $300. The cost per foot of drilling—except power—is about 65 cents. The diamond drill is considered a good prospecting tool for extensive work.

XYLOLITH is made at Dresden, Germany, of sawdust and magnesia, the mixture being heated to 200° Fahr. and subjected to a pressure of 2250 pounds to the square inch. It can be worked like hardwood by tools, but will not warp, burn or become damp, is made into any shape or size and used extensively for building.

SO FAR the chief form of mine swindle in 1900 is the old game of bogus companies advertising in Eastern papers bogus stock of non-existent mines, hoping to harvest from the ignorant before the inevitable expose in some mining paper. Mining is no more responsible for such swindles than any other form of business, but those swindled do not think so.

ON May 29, 1896, the President vetoed the $250,000 appropriation for California restraining dams; three days after the House passed the bill over his veto; the next day the Senate did likewise. The following winter the California Legislature made unanimous joint appropriation of $250,000 for the same purpose. The $500,000 has ever since been available. Considerable talk has gone on. Nothing definite has resulted.

APART from the intelligent zeal and energy of the Colorado miner, nothing has so aided in the development of that State's mineral resources as the railroads. Branch roads run into all the mining districts, and the discovery of a new district is the signal for a railroad extension, no matter how apparently inaccessible. It is this that makes and maintains Colorado's prominence in the mining world. Were Colorado a State of one railroad and no competition, its annual gold yield would be less than half what it is.

THE existence of fissure veins is primarily due to one or more fault planes, fissures of seams, forming ducts for the ore-bearing solutions. The ore proper, which is constituted of various sulphides with a gangue of more or less quartz, calcite, etc., occurs chiefly along these separating planes and on seams connected with them. The typical fissure vein may be regarded as a single break along which, through faulting, more or less continuous open spaces were formed and subsequently filled with ore. On both sides of this filling there is a gradually fading zone, in which more or less extensive alteration of the country rock has taken place.

REGARDING the mechanical equivalent of a 16-candle electric incandescent light, or its value in foot pounds, a foot pound per second is $\frac{1}{550}$ H. P.; a watt is $\frac{1}{746}$ H. P. A watt is therefore the smaller of the two, being only about 0.74 as large. A 3-watt 16 C. P. incandescent lamp consumes 48 watts per second, or $48 \times 0.74 = 35.5$ foot pounds per second, or $35.5 \times 60 = 2130$ foot pounds per minute. This means that 2130 pounds (a little over a ton) falling 1 foot, or one pound falling 2130 feet, would, theoretically, develop enough energy to keep such a lamp burning for one minute. Assuming 80% efficiency, it would require a weight of 2663 pounds (1⅓ tons) to drop 1 foot, or one pound to drop 2663 feet to maintain the lamp for one minute.

STEEL of superior quality is now being successfully produced by the Tropenas process at the Union Iron Works, San Francisco. The process was described and illustrated in the issues of Dec. 31, '98, and Jan. 14, '99. The Tropenas pneumatic steel process is a modification of the Bessemer process. It consists in decarbonizing pig iron, melted in the usual way, by means of air compressed under a light pressure. To accomplish this a special converter different in many points from the Bessemer and other similar apparatus is used. In brief, the Tropenas process differs from the other pneumatic processes in the following characteristics: The compressed air does not penetrate into the metallic bath, but acts only on its surface. Contrarily to all other similar processes which have in view the agitation, more or less, of the metallic bath, all the arrangements of the Tropenas process tend to keep the bath as quiet as possible during the operation. By so doing Tropenas avoids giving to the metallic bath any further agitation than the natural one caused by the chemical reaction going on in the bath. In the Bessemer operation nearly all the carbon contained in the metal is transformed into carbonic oxide, the proportion in volume reaching from 20% to 30% of the total quantity of the escaping gases, while in the Tropenas process the top row of tuyeres allows of the rational burning, above the surface of the metallic bath, of all the carbonic oxide arising from the metal, thus increasing considerably the temperature of the final steel.

THE report of the Secretary of War, U. S. Engineers, 1891, Vol. II, Part V, page 3080, says: "The total quantity of auriferous gravel remaining and available for working by hydraulic process on the Yuba and American rivers, Cal., is 1,508,875,000 cubic yards, to which is added the quantity remaining available for washing by hydraulic process on the Feather river, upper Sacramento and southern rivers tributary to the San Joaquin, Cal., 600,000,000 cubic yards, making a total quantity of 2,108,875,000 cubic yards." The value of this quantity of auriferous gravel is estimated by the U. S. Engineers and others employed by the Government for making such estimates at $552,665,000.

CARBONITE AND KYNITE are explosives used in a secondary way in British mining. Carbonite in every 100 parts of the finished explosive has 26 parts thoroughly purified nitro-glycerine, 34 parts barium nitrate and potassium nitrate, or either of them, 38 parts woodmeal, ½ a part sulphuretted benzol, ½ a part of sodium carbonate and calcium carbonate, or either of them, the whole being uniformly incorporated and of such character and consistency as not to be liable to exudation. Kynite consists in every 100 parts of the finished parts of the finished explosive of 26 parts nitro-glycerine, 35 parts barium nitrate and potassium nitrate, or either of them, 37 parts of woodmeal, ½ a part of sulphuretted benzol and ½ part of sodium carbonate and calcium carbonate.

IT is always economical and usually necessary to have considerable expert examination of the character of the ore intended to be crushed before ordering the reduction plant. A style of mill that would suit one ore might prove entirely unsuitable for another kind of ore. All the characteristics of the ore should be thoroughly and systematically studied. This will cost money, but 'tis better to spend money that way than to rush headlong into an expensive construction that may result in loss. And in this regard the mining machinery manufacturer can be of great aid in advice and experience as to determine what is best. In these days of advanced milling methods, there is little excuse for the failure of a properly provided milling plant if sufficient ore can be furnished.

FIGURING on the loss in sulphurets, in an attempt to locate it, one can pass a 10,000-grain sample through a 60-mesh wire screen; weigh what passes through and what remains; carefully pan each lot by itself from one pan into another just as long as the sulphurets show: each batch to be then accurately weighed, separately. If pulp samples are used instead of tailings the amount of sulphurets in the ore can be determined. Say the sulphurets assay $80 per ton, and the quantity per ton is 1.8%, the value of the sulphurets in one ton of the ore would be 75×0.018, or $1.35 per ton. Should the loss of sulphurets in the tailings be shown to be 15 grains out of the 10,000-grain sample, and the value of the sulphurets $75 per ton, then 75×0.0015 would give the value of the sulphurets in the tailings at $0.1125 per ton of tailings.

THERE is no grant from the Government, under the Act of Congress, unless there is a location according to law and the local rules and regulations. Such mining location is a condition precedent to the grant. Mere possession, not based upon a valid location, would not prevent a valid location under the law. The Supreme Court of the United States affirms this and says: "The right to the possession comes only from a valid location. Consequently, if there is no location, there can be no possession under it. Location does not necessarily follow from possession, but possession from location. A location is not made by taking possession alone, but by working on the ground, recording and doing whatever else is required for the purpose by the Acts of Congress and the local laws and regulations."

IN a new method of preparing white lead a basic lead acetate solution, containing 11% of basic salt, is treated with carbonic acid at a temperature of 120° Fahr. while flowing in thin layers over a series of shelves. An essential point is that the process must be stopped when one-half of the basic lead salt has been converted to white lead. The product contains from 30% to 37% of hydrated lead oxide, and is amorphous. To stir finely powdered litharge into a solution of normal lead acetate would cause the mixture to crystallize. By exposing the crystals to carbonic acid gas a basic carbonate is formed, while neutral lead acetate remains in solution. A solution containing 14% of normal acetate is treated with fourteen pounds of litharge to each cubic foot of the solution. Coarsely powdered litharge is used at first, but the final additions are made with litharge that has been passed through bolting cloth of 200 meshes to the square inch. The process is carried out with a steam-jacketed copper vessel provided with a stirring apparatus. After eight minutes the mass becomes curdy, and then a stream of carbonic acid gas is passed into the vessel. The crystals melt and are in part converted into white lead, which is separated from the lead acetate solution by the use of a filter press.

Copper From the Ore to Wire Bar.

Condensed from a recent address by A. R. LEDOUX.

The production of copper in America from 1845 to 1890 amounted in round numbers to 1,000,000 tons. Prior to 1880 Lake Superior produced nearly the whole quantity, but from 1880 to 1890 Montana and Arizona began to compete with the Lake region, and the figures for that decade are: Lake Superior 45%, Montana 36%, Arizona 15%, elsewhere 4%.

In 1890 Montana passed its rival, the figures for that year being: Lake Superior 38%, Montana 43%.

The following table shows the increase in production in the last five years. It is stated in pounds and in round numbers:

LAKE.

1895.	1896.	1897.	1898.	1899.
129,000,000	143,000,000	145,000,000	158,000,000	155,000,000

MONTANA.

1895.	1896.	1897.	1898.	1899.
190,000,000	232,000,000	237,000,000	216,000,000	239,000,000

ARIZONA.

1895.	1896.	1897.	1898.	1899.
47,000,000	72,000,000	81,000,000	111,000,000	122,000,000

Broadly speaking, the metallic mines are confined to Lake Superior, the sulphide ores have received their greatest development in Montana, and the oxide ores are characteristic of Arizona.

The Lake Superior ores carry the copper in an almost chemically pure form. The metal is disseminated through lavas, sandstones and conglomerates, sometimes in masses, but usually in tiny specks—the average assay of the district being less than 4% of copper, but the distribution is uniform and the average sure.

The Calumet & Hecla has paid its shareholders over $66,000,000 since 1871, and has produced nearly 1,500,000,000 pounds of copper. The ore is raised from twelve shafts, one of them over four-fifths of a mile in vertical depth. Five thousand tons are hoisted daily an average distance of 3000 feet. The cost of Calumet copper laid down in New York in the form of wire bars or ingots probably does not exceed 6 cents per pound.

In the Tamarack, another Lake mine, the deepest shaft is 4600 feet, and will soon reach a mile in vertical distance from the surface.

The Lake Superior ore admits of simple treatment. It is pulverized in steam stamps, each handling hundreds of tons in a day. When pulverized and automatically screened and separated into several grades of fineness it passes to jigs and concentrating tables or buddles. A jig is practically a sieve plunged up and down in water. The lecturer illustrated this by supposing a flour sieve to contain a mixture of white sand and shot of substantially the same size. If the sieve were forced up and down in water the ascending current would finally bring all the lighter sand to the surface, leaving the heavier shot on the bottom. If the mixture flowed into the sieve continuously, the light sand would overflow the side of the sieve with the water, and by and by the shot would all be collected on the bottom, whence it could be continuously or intermittently removed. The finest ore in size goes to tables over which a stream of water flows—the lighter and worthless gangue being washed away, while the heavier metal remaining upon the table is caught or diverted into another direction. While the ore of the Calumet probably averages 4% copper, there are other paying mines that have phenomenal records of economic working. Among these is the Atlantic. In 1898 it produced 4,500,000 pounds of copper, yielding the company 11.83 cents per pound. The average of the ore was about six-tenths of 1%, or a value of $1.40 per ton of ore raised; mining costs 90 cents, transportation 5 cents and milling 24 cents. The total operating expenses, including freight and commissions, were $1.3481 per ton. The copper, therefore, cost 9 cents a pound, giving a net profit of nearly 3 cents. This record is not equaled in any other copper mine.

The so-called mountain system of veins is characteristic of the Rocky mountains and Sierra Nevadas, and receive their greatest development in the vicinity of Butte, Mont., as far as sulphide ores are concerned. The Butte mines are complex. There is no "bed" corresponding to the Calumet conglomerates, but sulphides are interspersed in bunches or otherwise through altered granites. The Butte district is seven miles by four in extent, but the mines that have made Butte famous underlie an area of about 3000 by 7000 feet. The Butte mines—many of them—were started as silver propositions, the altered surface ores being rich in that metal. As depth increased rich ores grew somewhat more scarce, but at the depth of (to-day) from 1500 to 2000 feet the grade is quite uniform—in the neighborhood of 6% copper is the average of the camp. In the early days the Butte mines used to ship ore to sampling works in New York which contained over 50% copper. All the Butte ores contain gold and silver as well as copper. The Anaconda has produced 1,000,000,000 pounds of copper, 50,000,000 ounces of silver and 150,000 ounces of gold. This copper mine is the largest silver producer in the world. From 3000 to 6000 tons of ore are daily mined from the Anaconda. The Anaconda supports the surface by the introduction of a forest of 60,000,000 feet of lumber yearly. The ore is carried twenty-seven miles to the metallurgical works which reduce it. The difference in the treatment as compared with the Lake Superior is due to the fact that in the first case they have only metallic copper to separate, refine and remelt into wire bars or ingots, while the sulphide ores contain a larger proportion of impurties than Lake copper, the principal impurities being sulphur and iron, although arsenic, antimony, bismuth and other undesirable substances, including tellurium, are usually present. The metallurgy of the Butte copper ore, therefore, consists of several stages: First, the concentration to separate the sulphides from the granite or other gangue; second, roasting to get rid of the greater part of the sulphur with its accompanying volatile impurities; third, the smelting of the roasted sulphides to form matte; fourth, the so-called bessemerizing of the matte to produce impure copper, and finally the refining of this impure copper. The ore arriving at the Anaconda works is discharged from the cars at the highest point, the works being situated on a side-hill; it passes through crushers which break it up small enough to go into the steam stamp mills, from which, being automatically separated into various grades of fineness or size, it passes to jigs similar to those employed at Lake Superior, which separate the ore from the gangue and deliver the concentrated ore at the roasting furnaces. Some of the very fine ore is treated separately on tables. The ore is roasted in several mechanical roasting furnaces of different make and principle. In the early days of copper smelting the sulphides were usually roasted in heaps on the ground, and sometimes in so-called stalls, but in the most modern plants the roasting is performed in mechanical furnaces.

These and nearly all concentrating works are as nearly automatic as possible. The ore descends by gravity from the cars through the crushers and other apparatus to the lowest level of the works and is carried from place to place by streams of water. Even the ashes from the roasting and smelting furnaces are continuously carried away by a current of water flowing through the ash bed, and they are discharged at a long distance from the works without the intervention of any hand or tool.

There are two types of roasting furnaces at Anaconda. The Bruckner furnace is a cylinder some 20 feet in length by 10 feet in diameter, lined with brick and revolving slowly. The unroasted ore goes in at one end and is discharged at the other while the gases from the burning sulphur go up the stack. Each furnace handles about 18,000 pounds of concentrates in a day, reducing the sulphur from 40% to 10%, which is a most favorable proportion for subsequent operations. It takes about one ton of coal a day to fire each furnace, the coal available in Montana being much inferior to Eastern coals. It also takes the labor of two men per day of twenty-four hours to handle the material passing through one furnace. Another type employed at the Anaconda is the Wethy furnace, which consists of three or four horizontal shelves, one above the other; at the end of each shelf, but alternating in their position, are holes through which the ore can drop from the upper to the lower level. An endless chain carries a rake along the upper shelf, dragging the burning ore toward the opening, through which it drops to the second shelf. The chain comes out at the end of the furnace over a sprocket wheel, re-enters the second shelf, dragging the ore in the opposite direction, hence it falls to the third; then the chain, still traveling onward over a second sprocket, drags the same along the bottom shelf, from which it drops into the car ready to receive it, more or less prepared for the subsequent operations.

The next step is the matting of the roasted ore. It is fed into an upright furnace of the cupola type, which is surrounded by a water jacket to keep it cool. Coke or limestone or other necessary fluxes are added and a blast of air introduced. Under the effect of the blast and of the heat evolved the ore melts. The impurities are largely slagged off, this slag carrying iron, silica, lime, etc., and the sulphide of copper is concentrated still further into a matte, which runs about 30% of copper, or can be brought up to 45% or 50%, or even higher if desirable. At this point begins the bessemerizing of the copper, which is the most important of recent discoveries in the metallurgy of this metal. The well-known Bessemer furnace, which has been used for many years in converting iron into steel, is now universally employed for taking advantage of the oxygen of the air in removing the 30% to 40% of sulphur which the matte contains. The Bessemer furnace is of various kinds, being the ordinary pear-shape converter with which the steel industry has made us familiar, or a simple trough. In the bottom of the converter air tubes are introduced; the molten matte is run in from the furnace and the blast turned on; the sulphur combining with the oxygen is discharged as a gas—the remainder being brought to a purity of from 96% to over 98% of copper. Of course, this copper carries with it the gold and silver which were originally present in the ore. The converter is discharged when the reaction has ceased, and the copper produced is cast into pigs, or converter bars, as they are called. The converters are lined with various mixtures in order that the substance of the lining may unite with some of the impurities in the copper that are not volatile, and, forming a slag, be easily carried off.

The next step at Anaconda and elsewhere where converter copper is produced, carrying precious metals, is the electrolytic separation of the metals.

The ores of Arizona and of the southwest in general are of the carbonate or oxide type as far as the surface ores are concerned, remembering, of course, that only general terms are being used, and that in every district as well as in every mine there are more or less of all types of ore. In Arizona there has never been any glacial erosion which has removed the oxidized ores with all the decomposed rocks of the surface in our northeastern States and in many parts of the Rocky mountain range. These oxidized ores always overlie sulphides when they have not been artificially removed. As a type of the carbonate and oxide mines of the Southwest, the Copper Queen is worthy of attention. This mine was opened in 1880, and a small furnace operated on its ores that year. To-day it has become one of the largest mines in the world, with some 20 miles of shafts, tunnels, galleries and levels, and ore in sight capable of yielding 3,000,000 pounds of copper per month for many years. The occurrence of the Copper Queen's and similar ores is in limestone, and in this rock they are deposited in eccentric and curious ways. Bodies of ores are come upon without the slightest indication of warning, and equally without warning they suddenly disappear. From barren rock, showing no trace of copper, a drill will sometimes enter a cave of great extent, the sides and walls being magnificent with blue, red and green copper stalactites, and underneath large bodies perhaps containing thousands of tons of rich ore. In the Copper Queen there are to-day cubes of ore blocked out on all sides that exceed 400 feet on the edge. Up to 1884 this mine produced 20,000,000 pounds of copper from a body of ore which was then exhausted. Another bonanza was discovered, from which the mine is still taking out millions of pounds of copper a month, and with no indication of immediate exhaustion. The surface ores of these carbonate mines could be smelted without bessemerizing or roasting, producing in the furnace by one operation black copper equivalent to the converter bars and suitable for the electrolytic separation, but, with depth, sulphides came in, and now the Copper Queen also is bessemerizing mattes and producing converter bars which go East for their electrolytic refining. The metallurgical works of the Copper Queen are most thoroughly modern in every respect. They use the trough converters previously mentioned, holding about 30 hundredweight of matte which assays 33% copper. These converters are 8 feet long by 6 feet in diameter.

The final stage of copper refining is the electrolytic. Till recently all the electrolytic establishments of the country could in a sense be considered experimental, but works erected in 1899 were probably the most perfect that could be devised for some years to come. The lecturer deplored the extreme jealousy and consequent secrecy which existed in some works, preventing the men in charge exchanging with one another improvements and variations in the method for the common good of all. He stated that in the application of this process, as he had observed it in visiting various works, the differences were comparatively slight. Some used wooden vats and some slate, some prefer the arrangement in series, some in multiple arc. Some companies thought best to increase capacity by enlarging the number of tanks, thus adding to their permanent investment; others increased their permanent expense by increasing the power in a fewer number of tanks. He stated that the chief difficulty was the maintenance of a constant-current density, and quoted Dr. Keller's statement that he did not believe a current density of over 18 amperes per square foot had ever been successfully exceeded for any length of time in the United States, and that the average density did not exceed 12 to 15 amperes per square foot. He discussed briefly the relative merits of the Hayden and other systems employed at different works, stating that the chief difference was in the form of the anode. In most works operating under Hayden's patent the anodes were rolled into sheets, although in one of the works in England they had successfully cast their anodes into plates not over ¾-inch thick. He spoke of different modes of hanging the anode which were practiced, stating that the Hayden system economized space, as the anodes could be set more closely, thus admitting also of greater current density and a more rapid turning of the copper, the result being to decrease the amount of metal tied up in the tanks.

The cost of the electrolytic operation at Anaconda is stated to be three-fourths of a cent per pound of copper. In Eastern refineries, however, contracts have been made by which the refiner agrees to return to the miner all the copper, gold and silver the assay certificates call for in the form of refined copper, gold and silver. Charges for his services in some cases are so much less than 1% per pound that it is evident that it does not cost the Eastern refiner as much as three-quarters of a cent, even including interest on money tied up in the metals in the vats.

The Theory of the Wiring Table.

By THOMAS G. GRIER.

Wires are used to form an easy and direct path for the distribution of the electric current, as pipes are used for distributing gas or water to places at a distance from the source of supply. The sizes of pipes are determined upon the basis of the distance and the quantity of material sent through them. Wires, as well, must have some distinct size depending upon the circumstance governing different conditions. It is necessary to make calculations in order to ascertain the size of wire, and to shorten and to simplify this work of calculation wiring tables have been compiled.

A wiring table gives at once the result in the commercial size of wire; and when the proper table is at hand, no multiplying or dividing, no figuring, no application of a formula is required.

In all substances there exists some unknown obstruction to the flow of an electric current. The technical name given to this obstruction to the passage of an electric current is resistance. It is not known what causes this resistance, but by experiment the extent to which it exists in any substance can be ascertained and measured. It is known how in any substance the amount of resistance may be varied by altering the dimensions, also as to the amount of energy necessary to overcome any resistance.

The theory of the wiring table is simply one of proportioning resistances. The first point to be considered is how is the resistance varied in any substance. The law states that the resistance of any substance varies directly as its length and inversely as its cross-section. This law has been verified by experiment and is universally accepted as a law of nature.

The resistance varies directly as the length of any given substance means that, if the length of a wire is doubled, the resistance is doubled, and three times the length means three times as much resistance. The resistance varies inversely as the area of cross-section means that, if the area of a wire is doubled—that is, if there is just twice as much metal for a given length of wire—the resistance is decreased one-half; if the area is increased three times, the resistance is decreased to one-third.

In a wire of a given substance, if the length is doubled and at the same time the area is doubled, the resistance remains the same; or if the length is increased to three times as great, and at the same time the area is increased three times, the resistance remains the same.

From this application of the law already referred to it can be seen how it is possible to vary the size of a wire so that the resistance remains constant for any length, or how the resistance may be changed to suit any condition or circumstance.

The next consideration is the action of the electric current. The pressure is measured in volts, and the rate of flow is measured in amperes. The volts are all used up in forcing the amperes against the resistance. The resistance (if it were all in the wire) would mean a total loss of the electrical energy, because the volts would be used in doing work from which no results were obtained.

It is necessary, therefore, to make the resistance of the wire which conducts the current but a proportion of the total resistance, the rest of the resistance of a circuit being that which exists in the lamps and the other devices or apparatus which convert the electrical energy into commercial forms as light, power or heat.

To so compile a table and calculate the sizes it is necessary to consider the relation which exists between the unit of resistance—the ohm—the unit of pressure—the volt—and the unit of current—the ampere.

One ohm resistance requires the pressure of one volt to transmit one ampere; two ohms require two volts to transmit one ampere. One volt will transmit but one-half an ampere over two ohms, and 100 volts will transmit 10 amperes over 10 ohms. This is Ohm's law, which, when given in the form usually found in text books, is as follows: The rate of flow or current, measured in amperes, is equal to the volts divided by the ohms. The volts are equal to the amperes multiplied by the ohms, and the ohms are equal to the volts divided by the current flow or amperes.

Knowing the relation of resistance to the flow of currents and to the pressure, the next point to be considered is the substance used for the wires and ascertain the amount of its resistance for a given length and size, to be used as a unit for making the calculation necessary in compiling the table.

Copper, commercially and physically, represents the best conductor for the transmission of the electric current. A dollar's worth of copper will conduct a greater amount of electric current than any other metal of equal value with the same loss of energy.

In the illustrations following, copper will be the substance considered, as the wiring tables used for ascertaining the size of wire are for copper wire. The units by which wire is measured are the circular mil and the foot. The circular mil is the area of a circle whose diameter is one one-thousandth of an inch. The foot is a unit familiar to all.

The unit of wire then would be a wire one foot long, the area of which is one circular mil, and the resistance of this unit of copper wire is between 10 and 11 ohms, depending upon the temperature of the wire; 10.6 ohms may be assumed as the resistance which approximates closely to the average at ordinary temperatures. Taking this as the basis for compiling a wiring table, it is known that to send an ampere through this unit of wire would require 10.6 volts, for, as stated in Ohm's law, the volts must equal the ohms multiplied by the amperes. In everyday problems the known quantities are the volts and amperes, and the calculation is to find wires of proper resistance to suit the conditions.

The resistance, or the ohms, must equal the volts divided by the amperes. To solve this problem the volts are divided by the amperes, and we have the resistance, which varies as the length and inversely as the area. It is the area of a wire which is desired, and one the resistance of which will equal the resistance found by dividing the volts by the amperes. The resistance of one foot of copper wire, one circular mil in area, equals 10.6 ohms.

The resistance of any wire is equal to its length multiplied by 10.6 and this divided by the area. Now it is known that the volts divided by the amperes equal the resistance, and the volts divided by the amperes are, therefore, equal to the length of the wire multiplied by 10.6 and divided by the area.

In any problem of wiring we have the number of volts and amperes, also the distance the current is to be transmitted, and the only thing remaining to be found is the area. To find this, we multiply 10.6 by twice the distance, or the total length of wire (in multiple arc work there is one outgoing wire and the return circuit, which makes the total length of wire double the distance), and multiply this by the amperes and divide the product by the volts used, which gives the area of the wire.

The volts used are not the total volts of the system, but the volts lost in the wire. If the problem is given so many per cent loss, it would mean a per cent of the total number of volts. To illustrate: If the wire is to use up 2% of the pressure, and the voltage of the system was 50, then you would divide by 2% of 50, or one volt; or, if the pressure was 100 volts, you would divide by 2% of 100, or two volts.

In compiling a table, let it be assumed for a fifty-volt system for a regular increase of distances of 10 feet, the following method is pursued: First, the per cent loss is ascertained, let it be 2%. This, then, would be one volt. Then one ampere will be considered, first, as the total current flow, and the following calculations would be made: 10.6 would be multiplied by 10 feet and by two to get the length of the wire, and this multiplied by one ampere and the product divided by volts lost, or, in this case, by one, which would give us an area of 212 circular mils. This would be the size of a wire necessary to allow one ampere to be transmitted 10 feet with one volt loss, or 2% of fifty volts.

The next calculation would be for 20 feet distance, and, as the resistance of the wire must remain the same, the area first found, namely, 212 circular mils, must be doubled as the distance has been doubled. For 30 feet to keep the resistance constant, the area is increased three times, and so on until the limit of the table—say 200 feet—is reached, when the area will be increased twenty times, as the length has been increased by that amount.

Then the same method will be continued for two amperes, namely, multiplying by 10.6 by the distance and by 2 to get the length of wire, and this multiplied by amperes and the whole divided by the volts lost. This is continued until the area for all the wires for each of the distances and for the various number of amperes has been determined.

As it is necessary to multiply 10.6 by the distance multiplied by 2 in every instance, 21.2 is used instead and the straight distance used. The whole resolves itself into the simple formula:

$$\frac{21.2 \times \text{distance} \times \text{amperes}}{\text{Divided by volts lost}} = \text{area of wire.}$$

When these areas are found the commercial sizes of wire are inserted in the table which are nearest to the size found, but always larger, never smaller—that is, if the area found in the calculation came between a 0 wire and a 00 wire, the 00 wire would be the size used in the table.

Metallurgical Plant of Chas. Butters & Co., Ltd.

Chas. Butters & Co., on the 1st inst., opened for custom work an ore testing works, chemical and metallurgical laboratory and assay office in the Dooly Block, Salt Lake City, Utah, in charge of Mr. E. S. Leaver, formerly chemist and assayer at the Mercur, Utah, mill, but for several years associated with Mr. Butters in the laboratory and experimental work that has been of an extent commensurate with the interests involved. On the first page appears three views of the large establishment which is unusually extensive and complete.

The plant covers a ground area of 60x105 feet, the main shaft running through the center of the room, connecting directly and through countershafts with the many machines. Electric power is used. Among the machinery are two Gates crushers, sizes 0 and special; two Krupp ball mills, sizes 00 and smaller, with several sizes of screens for crushing any mesh desired; Wilfley concentrating table, magnetic separator, sample grinder, reverberatory roasting furnace with a capacity of 500 pounds per charge, spitzlutte, steam drier, sampling floor, centrifugal pumps, air compressor so connected as to use in any part of plant; forty-six vats of a capacity of 100 pounds to four tons, with numerous smaller tubs and apparatus; agitation vats up to 850 gallons, fitted up for auxiliaries such as air and steam. There are complete assay and chemical departments and scale room, separated from each other and from the metallurgical department by glass partitions and fitted up in modern manner. A drawing room and office are in direct connection. There are cement floors in the metallurgical departments to enable flushing. It is lighted with gas, sixty-four incandescent electric lights, and supplied with steam, sewer connections, etc., the whole constituting a finely appointed establishment. The engravings on the front page give a fair idea of the completeness of the model establishment.

Cyanide Plant at the Octave Mine, Weaver, Arizona.

Written for the MINING AND SCIENTIFIC PRESS by D. E. BIGELOW.

The illustration on the front page shows a MacArthur-Forrest cyanide plant for treating the tailings from the old "Rumer" mill, near Weaver, Arizona.

The tailings dump was purchased and the plant erected by Mrs. Cook, who has recently disposed of an interest to P. H. Newman, A. R. Howe and S. A. Barbee, who are now operating it under the name P. H. Newman & Co., with Mrs. Cook as assayer. This is one of the few instances where women are practically engaged in mining.

The picture shows how simple a cyanide plant can be made in a region where little or no protection from the weather is necessary.

There are about 4000 tons of tailings in the dump of the average value of $6 per ton, of which 90% to 95% is recovered. The plant consists of four leaching vats 12 feet diameter 4½ feet deep, two gold solution tanks 8 feet diameter 4½ feet deep, one sump 12 feet diameter 4 feet deep, all of redwood, painted two coats paraffine paint inside and outside, and twelve individual iron zinc boxes of 1 cubic foot capacity each.

The filter bottoms of the leaching vats are made of strips of wood 1¼x2 inches placed edgewise and nailed to the bottom of the vat 3 inches apart, with notches cut at intervals of 12 inches in bottom of the strips to allow free circulation of solutions. Spaces between the strips are filled with fine gravel, and the whole covered by cheese cloth and burlap, caulked around the sides with 1½-inch rope.

A large part of the values is carried by the slimes, which consist of about 15% of the whole dump, occurring in layers and patches several inches thick, and from the first their treatment has been the problem, now, however, happily solved as follows:

The cakes of slime as shoveled from the dump are thrown against a ¼-inch mesh wire screen, and being broken up fine, are mixed with coarser sand and charged into the leaching vats upon a layer of 2 feet of coarse tailings.

The vats thus charged contain eighteen tons of tailings each and are treated by five washes, each about 2½ tons, as follows:

No. 1. A strong solution containing ¼ of 1% cyanide is run into the vat from below and allowed to percolate upward through the pulp. The bottom of the solution tank is situated on a level with the top of the leaching vat, and the flow of the solution is controlled by a valve, so as to require three hours to fill. The solution is retained in the vat for twelve hours, and then drawn off into the gold tank, which operation requires four hours.

No. 2. A solution containing ⅛ of 1% cyanide is run on the top, requiring one hour to fill, twenty-four hours in contact and four hours to drain off.

No. 3. A solution of ⅛ of 1%, used same as No. 2.

No. 4. The rinse water of a previous vat, containing ⅛ of 1% cyanide, is run on the top and is drawn off after standing three hours. All above washes are drawn into the gold tank and brought up to strength of ¼ of 1% before passing through the zinc boxes.

No. 5. Clean water is run on, and after standing three hours, is drawn off into one of the gold tanks, to be used again before precipitating, as No. 4 wash.

The spent solutions, after passing the zinc boxes, are returned by hand pump to the solution tank above, brought up to required strength and used again and again for about two months, when it becomes foul with iron and impurities and is discharged.

The consumption of cyanide is one pound per ton of ore; of zinc, one sixth of a pound per ton.

The upper zinc box of the series is removed every day, the remaining boxes moved up and a new box placed at the bottom. The precipitates are washed

from the zinc and the residue, after filtering, is roasted in a common baking pan over a cook stove and afterwards melted in a crucible with fluxes as follows: Six pounds precipitates, five pounds borax, three pounds soda, one pound sand. One vat is filled each day.

The labor required is four men to screen, charge and discharge vats by wheelbarrow, one man to pump the solutions by hand and an assayer.

Chemical and Physical Properties of Mercury.

Mercury when pure is not affected by air at ordinary temperatures; when impure, its surface becomes coated with what is probably a mixture of mercuric oxide, oxide of the base metals, and metallic mercury. When heated in air to 350° C., or just below its boiling point, its surface becomes oxidized.

Mercury is practically insoluble in water, but is readily dissolved by strong nitric acid and but slowly attacked by dilute nitric acid. Dilute sulphuric acid does not attack it, but it is dissolved by strong boiling sulphuric acid. Hydrochloric acid does not dissolve it, while hydrobromic acid attacks it slowly and hydriodic acid attacks it rapidly.

It forms two series of chemical compounds, mercuric and mercurous. Chlorine, bromine and iodine combine directly with mercury. Sulphur combines directly with mercury, either in the form of vapor or by rubbing the two elements together.

Mercury possesses a property distinctive from that possessed by all other common metals of being liquid at ordinary temperatures, its melting point being—38.8° C. It solidifies at —40° C., and boils at about 360° C. It is somewhat volatile at temperatures far below its boiling point, and is completely volatilized at a temperature just above boiling.

It is a poor conductor of both heat and electricity; its heat conductivity being 5.33 and its electrical conductivity being 1.63, that of silver being taken as 100 in each case.

Its specific gravity in the liquid state is about 13.6, and in the solid state it is about 14.3. Its atomic volume is about 14.7.

When mercury is agitated with oil, fatty substances, turpentine, many other organic substances, sulphur, etc., it is split up into a number of minute globules which are invisible to the eye and form a soft gray powder. This is what is commonly called "sickening" or "flouring," and is a phenomenon recognized by all millmen. The phenomenon of "flouring" is not perfectly understood, but it is probable that the small globules of mercury are coated with a film or thin envelope of oxide or sulphide of mercury. Vegetable or animal oils cause flouring to a greater degree than mineral oils. Reducing agents have a tendency to promote the coalescence of the particles of floured mercury, some of the most active being the passage of the electric current through the floured mass, or by the addition to it of water and metallic sodium, the effect being attributed to the reducing action of nascent hydrogen.

Mercury readily alloys with most of the metals forming what are generally called amalgams. When the proportion of mercury is large the amalgams are fluid; as it decreases they become pasty, and finally solidify, forming crystals. Most metals unite directly with mercury to form amalgams, but nickel, cobalt, manganese, iron, chromium, aluminum and platinum do not unite directly, but their amalgams can be formed by electrolysis of a salt of the metal, mercury forming the negative electrode, or by the action of sodium amalgam on a solution of the metallic salt.

Mercury and antimony do not unite in the cold, but by heating an amalgam is formed from which antimony gradually separates as a black powder.

Mercury and sodium combine to form sodium amalgam, which may be prepared by gently heating pure dry mercury in a flask and introducing small pieces of metallic sodium from time to time. Each addition of sodium causes the alloy to glow and emit considerable heat. With eighty parts of mercury to one part of sodium the amalgam is pasty; with sixty parts of mercury it is a stiff paste; with forty parts of mercury it a soft solid, and with thirty parts of mercury to one part of sodium it is a hard crystalline solid. Corresponding amalgams are formed with metallic potassium. Sodium amalgam melts upon being subject to a gentle heat, and loses its mercury at a point below redness. Under water it decomposes rapidly, and in air slowly. It should be kept in dry air-tight vessels.

The purity of mercury may be tested by allowing it to run slowly down an inclined glass plate or over the bottom of a gold pan slightly inclined. If pure, it should form small bright spherical globules, which will unite into a mass upon bringing them into contact with each other. When impure, the globules will be elongated and have a tail and will not readily unite upon being brought into contact with each other. Impure mercury leaves a film upon rough blotting paper, and upon being shaken up in a bottle containing dry air a black powder rises to the surface.

Commercial mercury is sold in iron flasks weighing about five pounds each and containing seventy-six pounds of mercury. It is frequently impure, when it must be purified before using in the mill. Mercury which has been in use in the mill for some time will be found to contain base metals, and should be purified.

Several methods of purification are in use, but the best are by chemical treatment or by distillation, preference being given to the former. Distillation in a large iron retort similar to that used for the retorting of gold amalgam is efficient, provided the mercury is not very foul. If the surface of the mercury in the retort is covered with cinnabar, the product will be quite free from base metals, as they will be converted into sulphides as they rise to the surface and come in contact with the sulphide of mercury. Iron filings and caustic lime may also be used as a cover, and are efficient when the mercury does not contain much base metal. They serve to decompose sulphides and prevent bumping during distillation. When the mercury contains lead and zinc, the distillation methods are not effective, as these metals are largely distilled together with the mercury. In such cases, and also when copper is present, chemical means are best. Zinc, tin, copper and iron may be removed by shaking up the mercury with dilute hydrochloric acid. Agitating with dilute sulphuric acid will generally remove zinc and iron. The best method is to treat the mercury with dilute nitric acid (one part acid of about 1.42 sp. gr. and three parts water) in a glazed earthenware jar, holding about seventy-five to one-hundred pounds of mercury when two-thirds filled. The mercury and nitric acid are introduced into the jar and stirred vigorously from time to time with a stout glass rod. This treatment, lasting from twenty-four to forty-eight hours, should free the mercury from impurities, when it can be drawn off from the bottom of the jar by means of a top-cock inserted in a hole near the bottom. Impure mercury can be added to the jar from time to time. The solution, as it loses bulk by evaporation, is replenished by fresh water, to which a few drops of nitric acid have been added. The mercuric nitrate formed reacts upon the base metals alloyed with the mercury, nitrates of the base metals and mercury being formed. The purification of the mercury used in amalgamation should never be neglected, as the use of impure mercury invariably results in the loss of both gold and mercury during the amalgamation, and it also produces a base bullion which is difficult to refine.

Andrew S. Hallidie.

Andrew S. Hallidie.

Andrew S. Hallidie died at his San Francisco residence on the 24th inst., of heart disease, in the 65th year of his age. He was one of San Francisco's foremost citizens, and his fame is world-wide as the inventor of the cable railway street car system, which he first put in practical operation in San Francisco August 25, 1873. To Mr. Hallidie, more, probably, than to any other one man, does San Francisco owe its urban development. Prior to 1873 the trend of travel was suburban: he made possible rapid transit up the steep hills to the west of the then thickly settled parts of the city, the cable railway developing and building up that part of the peninsula between the bay and the ocean.

Mr. Hallidie was born in Dumfries, Scotland, March 16, 1836. He came to California in 1852, and while mining for gold studied engineering, built wire suspension bridges, and in 1857 established the first wire rope factory west of the Missouri. In 1867 he invented the "Hallidie ropeway" or aerial tramway, the well-known device to carry ore, etc., in suspended buckets by means of a wire cable across streams and gulches; in 1869 he began working on the cable railway, the greatest achievement of his busy life, which he put into successful operation on Clay street, San Francisco, in 1873. In 1868 he was elected president San Francisco Mechanics' Institute and held that office for ten years; he was also a prominent member and officer in nearly every local society for commercial or scientific advancement, was regent of the University of California for thirty years, and a trustee of the California School of Mechanical Arts and of the lately organized Wilmerding School. Last year he made an extended trip to secure a fitting principal for the school which has since begun its career of usefulness, and since his return to San Francisco labored zealously as was his wont for the many public interests with which he was so prominently and intimately connected. He was also a member of many scientific societies throughout the world.

Personally Mr. Hallidie was one of the quietest and most unassuming of men. He was of constant aid to young men, always ready with genial counsel and substantial assistance, and to the last took an active interest in everything pertaining to the industrial and public welfare of his adopted city, for whose material progress he did so much. All his life he went around doing good and made the world to a marked degree better for his having lived in it.

Growth of the Copper Industry.

The rapid growth of the copper industry in the United States and the large proportion which this country supplies of the world's copper consumption is illustrated by some figures presented by a German publication entitled "A Century of Copper." It shows that the United States has during the decade 1891–1900 produced more than half of the copper of the world, while in the preceding decade it supplied but about one-third of the world's production, and in the decade 1871–1880 the proportion supplied by the United States was only about one-sixth of the total.

The growth of copper production in the century has, according to this statement, been very rapid, being in the first decade 91,000 tons, in the fifth decade 291,000 tons, and in the 10th decade, which ends with 1900, 3,643,000 tons, of which 1,963,000 tons is supplied by North America, the large proportion of this being from the United States.

The greatly increased demand for this material is further illustrated by the fact that, although the production has increased from 505,909 tons in the decade 1851–1860 to 3,643,000 in the decade 1891–1900, the average price, according to the publication in question, has only fallen from $540 per ton to $253 per ton, production having during that time increased more than six-fold, while the price fell but about one-half.

While the world's production has increased with startling rapidity during the century, that of North America has by far outgrown all other parts of the world, and it is apparently through the enormous supplies of North America—chiefly the United States—that the world's production has so greatly increased. A table contained in this publication which gives the production of each decade by principal countries shows no record of production in North America earlier than the decade 1841–1850, in which period the total production is given at 2400 tons, while in 1851–1860 it was 37,000 tons, in 1861–1870 97,000 tons, in 1871–1880 186,000 tons, in 1881–1890 730,000 tons and in 1891–1900 1,963,000 tons, the copper production of North America in the decade 1891–1900 being thus 2½ times as great as in the preceding decade and ten times as great as in the decade 1871–1880.

In the matter of consumption the figures are equally interesting. A table showing the consumption of England, France, Germany and North America gives the total consumption in those four countries at 409,583 tons in 1899, against 268,447 tons in 1893, being an increase of about 50% during the period under consideration; while in North America alone the production is given 77,433 tons in 1893 and 162,000 tons in 1899, the growth being over 100% during the period.

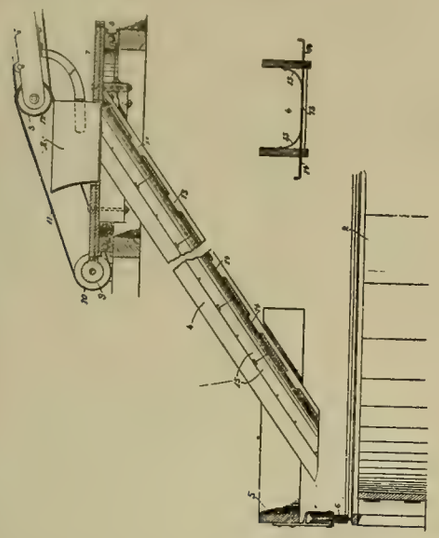
The rapid increase in the share of the world's copper consumption supplied by the United States is illustrated by the export figures of the decade just ended, which show that the exportation of copper in ingots, bars and plates, which in 1890 amounted to 20,237,409 pounds, was in 1899 254,987,164 pounds, while the total value of copper exported, exclusive of ore, increased from $2,349,392 in 1890 to $35,983,529 in 1899.

The following table shows the value of copper manufactures of all kinds, including copper in bars, plates and ingots, in each year from 1890 to 1899:

	Exported.
1890	$2,349,392
1891	4,614,597
1892	7,226,392
1893	4,525,753
1884	19,697,140
1895	14,468,703
1896	19,720,104
1897	31,621,125
1898	32,180,872
1899	35,983,529

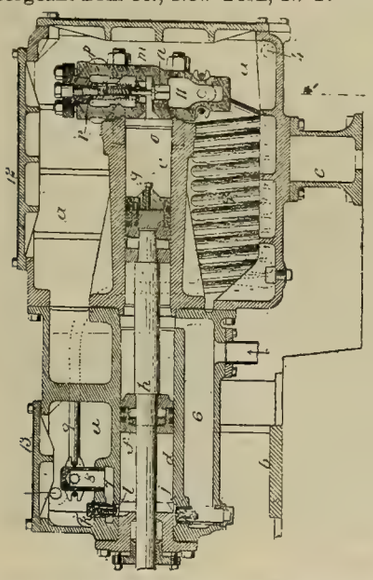
Mining and Metallurgical Patents.

Patents Issued April 17, 1900.



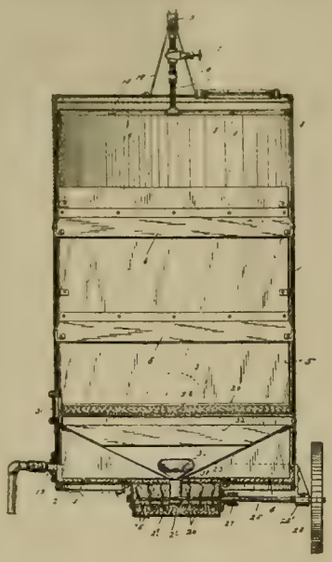
Specially Reported for the MINING AND SCIENTIFIC PRESS.

DRYING AND PULVERIZING APPARATUS. — No. 647,531; J. J. Seldner, Baltimore, Md.



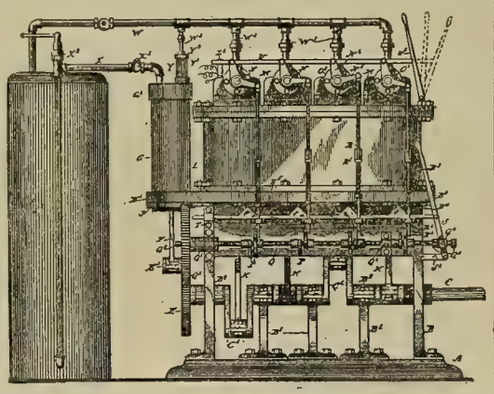
A combination of revolving cylinder comprising sections 10 having buckets, a rotating shaft arranged centrally therein, rings clamped between sections, central bearings for shaft supported by rings, frames 20 secured on and extending radially from shaft, and rods 21 extending between frames.

MEANS FOR CHARGING LEACHING VATS. — No. 647,678; C. W. Merrill, Alameda, Cal.



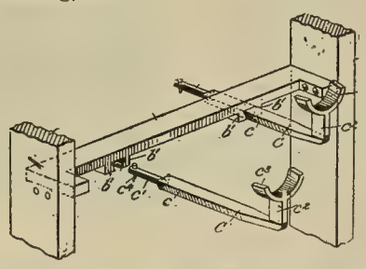
An apparatus for charging ore, tailings, etc., into vats or tanks consisting of an inclined hopper located and removable above the tank, openings made through bottom of chute at intervals in its length and gates or valves slidable transversely whereby openings may be transverse to one side or the other of chute and size of openings regulated; hopper located above upper end of chute and adapted to deliver material thereto, an endless traveling belt upon which material is delivered and by which it is transferred to the hopper.

COMPRESSOR FOR AIR, ETC.—No. 647,883; H. C. Sergeant, Westfield, N. J., assignor to The Ingersoll-Sergeant Drill Co., New York, N. Y.



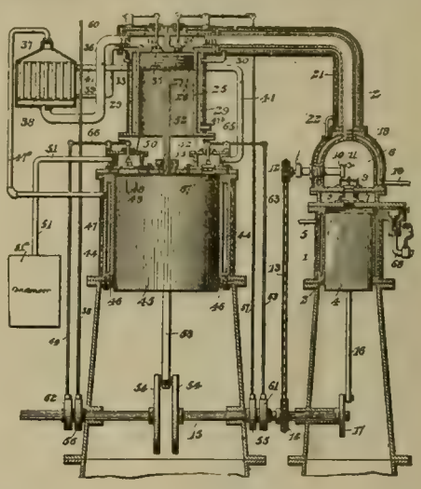
Combination in compound compressor, of cylinders and pistons for successive compressions, water-box in which cylinders and their valves are contained, cooler consisting of plurality of coils of pipe arranged in water-box, discharge pipe from first or low-pressure cylinder having plurality of branches communicating with coils at one end of each, chamber of communication common to other ends of several coils and valved communication between chamber and high-pressure cylinder.

APPARATUS FOR AMALGAMATING METALS. — No. 647,539; J. C. Teller, Minneapolis, Minn.



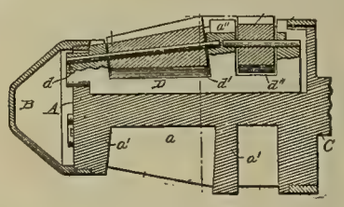
In an apparatus for collecting and amalgamating finely divided metals, combination with an amalgamating receptacle, of tube or spout delivering metal-laden fluid to intermediate portion, and an agitator mounted to rotate within amalgamating receptable, agitator having inclined propelling or agitating blades, blades on opposite sides of delivery end of spout or tube being reversely inclined, whereby the mercury and metal-laden fluid may be commingled under agitation and forced toward delivery tube or spout.

EXPLOSION ENGINE.—No. 647,583; C. A. Scott, Cedar Rapids, Iowa.



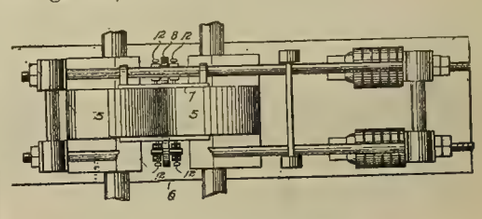
The combination with an explosion engine having a vapor compressor auxiliary to the explosion cylinders, of a throttle to control supply of compressed vapor and isolate contents of cylinders from that of the compressor during explosion, an electrical igniter, and an electrical connection of igniter with the throttle mechanism, whereby the electric circuit may be broken by throwing the throttle to an extreme position in opening; combination of gas inlet valve, connection thereof with actuating cam, a cam shaft provided with duplicate, reversed cams, means for shifting cam shaft so as to bring either cam into engagement with the valve mechanism, and means for disengaging cams from valve mechanism while the cam shaft is being shifted.

METALLURGICAL FURNACE.—No. 647,662; J. Lanyon, Pittsburg, Kan.



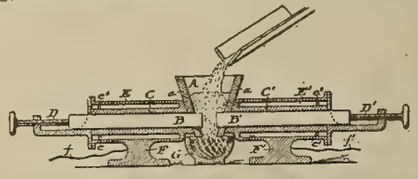
In a smelting furnace, the combination, with pair of buckstays, and a bearing bar located between buckstays and provided with outward-bent ends secured to buckstays, ends having sockets, of retorts carried by bearing bar, condensers connected to retorts and having sloping under sides, and supporting arms pivotally mounted in sockets in bearing bars and arranged to swing into close contact with under side of condensers.

GAS ENGINE.—No. 647,651; W. R. Dow, Boulder Creek, Cal.



In an engine, the combination of jacketed gas and steam cylinders, pistons operating in cylinders and connected for simultaneous movement, valved means for admitting gas under pressure to the gas cylinder, consisting of an explosion chamber and conveyor provided with jacket in communication with that of the gas cylinder, water supply pipe in communication with jacket of explosion chamber, valved exhaust for gas cylinder, valved inlet and exhaust ports for steam cylinder, condenser in communication with exhaust of steam cylinder, and water heater having a chamber in communication with exhaust of gas cylinder, and also with latter, being provided with final exhaust port for hot gases supplied to steam cylinder jacket from water heater, water heater also having a water receptacle in communication with jacket of gas cylinder to receive water therefrom, and with inlet port of steam cylinder to supply steam thereto.

DEVICE FOR REMOVING SCALE FROM BOILER TUBES. —No. 647,672; W. D. Forsyth and E. T. Bell, Pittsburg, Pa.



In a tube cleaner, a rotary head, centrifugally-acting arms mounted therein, each arm having journaled on it a single elongated inclined rolling cutter having an uninterrupted inclined cutting face adapted to make an inclined cut in the scale, and finishing cutters following first-named cutters.

PULVERIZING ROLL.—No. 647,894; A. Barmettler, Georgetown, Colo.

Combination with pair of pulverizing rolls of equal length having their axes in the same horizontal plane, of wheels mounted adjacent and engaging ends of both rolls at extremities of tangential line between them, whereby an ore receptacle is formed bounded by the rolls and wheels.

ELECTRIC FURNACE.—No. 647,614; M. Ruthenburg, Philadelphia, Pa.

In an electric furnace, combination with opposed terminals of an electric circuit, of a bosh laterally inclosing terminals, and open at top and bottom thereof, a crucible directly beneath bosh in relatively movable relation therewith, and an overflow outlet at the the top of crucible.

Some Observations on Practice of the Cyanide Process at Mercur, Utah.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by WM. MAGENAU, E. M.

The importance of careful and even packing of the zinc in the boxes and rearrangement at such intervals as to break up the channels without disturbing the zinc oftener than necessary has been properly emphasized by several writers, and the experience with these poor solutions strongly corroborates their observations. In one case where 260 pounds of zinc were kept in the boxes, distributed in forty-one compartments arranged in eight rows, the solution in passing through was reduced from $1 to from 20 to 30 cents. On changing this equipment to 220 pounds, distributed in twenty-two compartments arranged in five rows, the value left in outflowing solution was normally from 5 cents to 10 cents, while at the same time the amount of zinc consumed was reduced from .45 to .25 pound per ton of ore treated.

The methods of cleaning up the gold precipitate are adapted to the low grade of product obtained, which latter is the result of several conditions—first, the solutions carry in suspension considerable siliceous slimes which stay with the gold, and the gold in solution being in such minute proportion the amount of slimes deposited is large per ounce of gold. Then the amount of disintegrated zinc is also large, reducing the gold to below 6%. Some analyses will be given later.

The usual procedure of screening out the gold and fine zinc is followed, screens from 4 to 16 mesh being used. An efficient arrangement for precipitation consists of plain wooden boxes provided with false bottoms made of slats ½ inch by 1 inch and placed ¾ inch apart. These serve merely to support the zinc and allow the solution free circulation underneath. Solution flows alternately up and down. With intelligent handling of the boxes during a run the valuable fines can be separated from the coarse zinc without any screening, but by screening any lumps are broken up and a better material for sampling is obtained.

Various modes of manipulation are in vogue. That to be described has been used by the writer with good success. The flow in one row at a time is stopped, and the richer material, which has been concentrated in the upper compartments towards the end of the run, terminating in the cleanup, is transferred into iron tubs, without draining the solution from the boxes at all. The two top compartments only are cleaned out by scraping up the precipitates with a small scoop without removing the solution. Fresh zinc is put in and the flow re-established, when another row is similarly handled. Thus but one row at a time is out of operation.

Most operators would at once declare that this procedure must result in great losses by gold being carried off in suspension on restarting the flow, but this seems to be here prevented by the siliceous slimes present. On disturbing the richer zinc dense clouds of the suspended slimes rise in the solution, and before a row is half cleaned out the liquid is entirely milky. Each row has five or six empty compartments below those filled with zinc, and in passing through these part of the slimes settle and carry with them nearly all the floating gold. Repeated trials of the outflowing solution on a continuous sample taken during the entire cleanup show a rise of only 10 or 15 cents per ton of solution. With a perfectly clear solution the value of outflowing liquid has been known to go as high as $40 per ton.

The tubs of "product" are screened into a small tank, from which the supernatant liquid is decanted as soon as the screening is finished. This liquid, rich in suspended gold, is allowed to settle in another tank until the next cleanup, its excess liquid being then returned to the top compartment of one of the zinc rows. The drained product is removed to a steam dryer consisting of a circular cast iron pan 5 feet by 7 inches provided with a double bottom, in which live steam circulates. With this device, and forty pounds steam pressure, 500 pounds product could be dried to 1% moisture in six hours (taking one-half at a time). A similar dryer can be made of riveted boiler plate at less expense.

At some mills the drying is done in iron pans placed in a large cast iron muffle, and also in large amalgam retorts, and on top of iron plates heated from a fireplace. However it is done, this material is then boxed and shipped to the smelters (with one exception, to be mentioned further on). The metallic cases in which cyanide is received are used for this purpose. The output of the district is handled by the Consolidated Kansas City Smelting & Refining Co. (now one of the smelter trust), who have receiving and sampling rooms established in Salt Lake City. The express charges on product of average grade amount to 12 cents per ounce of gold. Twenty dollars per ounce is paid by the buyers. It might be of interest to insert at this point a description of the methods employed in sampling and assaying this rich material, as much has been said by the advocates of local refining about the difficulty of arriving at correct figures for settlement. As to sampling, it is surprising how nearly correct a result can be got from a single hand grab from the material which has been screened and dried, it having been well stirred during the latter operation. The following method was used as a rough check and to obtain an approximate value for billing out a shipment. The whole lot, amounting to say 400 pounds, was coned upon a large tin-covered table adjoining the dryer, an ordinary shovel being used. The cone was flattened into a pile which would be about 5 feet across and 5 inches deep. With a large spatula dips were made to the bottom of the pile all over its surface at intervals of about 6 inches. These quantities being piled up together, and amounting to some ten pounds, were well mixed and spread into a smaller pile, from which dips were again taken at intervals of an inch or two. This operation was repeated, with careful breaking up of small lumps with the knife, until fifteen or twenty grams remained, and this quantity was rubbed to a fine powder in a wedgewood mortar. A result from one-tenth assay ton of this sample usually checked the final settlement figures to within $200 on a $5000 lot, and was often very much closer.

The samples for settlement are made by the buyers by the old system of coning and quartering, great care being observed and the operation being conducted in a room lined with tin. This permits the collection of accumulated valuable dust. The amount of this from any one lot is said to be very inconsiderable. The final sample is ground and put through an 80-mesh screen. No attempt is made to force through the coarse particles of zinc remaining, but these are carefully separated and weighed, and accompany the fine portion, whose weight is also taken, from which they came. The method of handling these will be touched upon in describing the assay. For several years one of the larger mills systematically sampled each lot by the method to be next described as a check on the cone quartering plan, and the results were so consistently similar that the extra sampling was abandoned as superfluous.

At this place the product was dried in muffles and the free zinc was allowed to burn off. In this operation it became well mixed. Next it was coned upon a square tinned table 5x9 feet in size and provided with a 5-inch guardboard around the edge. The lot was evenly spread out on this table and the surface marked off in squares 5 inches on a side. From each of these a dip was taken with a broad spatula. These quantities were reconed together, and further reduction made by quartering, all lumps having been broken. The final small sample was put through an 80-mesh screen, hard rubbing in a wedgewood mortar being required to comminute the last particles of zinc.

Following are given some results obtained by this method on a lot (of unusually low grade) sampled in triplicate:

		Sample No. 1.	Sample No. 2.	Sample No. 3.
		Oz. per ton.	Oz. per ton.	Oz. per ton.
Assayer A	Au	714.05	704.40	704.45
	Ag	13.9	5.6	4.7
Assayer B	Au	711.60	712.15	703.8
	Ag	19.5	19.0	20.0

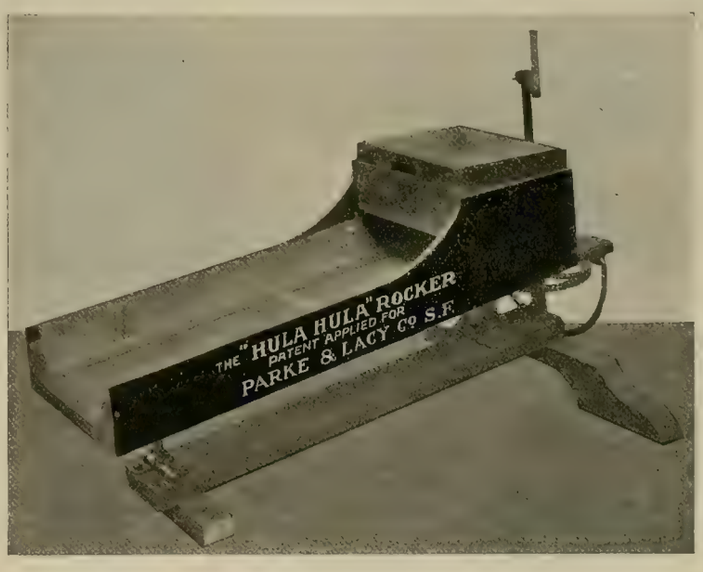
While some of the differences seem to be considerable, they are small in relation to the limit of accuracy in the methods of assaying, and also amount to but little in dollars and cents figured on lots of from 500 to 1000 pounds.

The assay is conducted by fusing one-tenth assay ton in the crucible with a litharge flux. The slag is run down with more litharge and the gold obtained from this added to that got from the original fusion. Corrections are also applied for cupel absorption. Perhaps a clearer idea of the method can be given by putting it in the form of a "scheme." The sample comes divided into two parts—pulp and metallics. First, for the pulp, take six charges of .1 assay ton each (weighed on analytical or good pulp balances) in ten-gram crucibles. Mix thoroughly with the following flux:

	Grams.
Litharge	70
Sodium carbonate (dry)	5
Flour (variable, but about)	1
Silica (variable with composition of product)	1 to 5
Borax glass	2

When mixed put on a heavy cover of salt, say two heaped teaspoonfuls. Place in a hot muffle—the hotter the better—and fusion will take place without spattering in twenty or twenty-five minutes. The slag will be exceedingly limpid and is to be poured into moulds and thoroughly cooled. The lead buttons (which should weigh from twenty-five to thirty grams) will separate beautifully from the slag, but each slag must be put back into its own crucible and run down with one gram of flour and a little litharge, soda and borax added, to collect any accidental shots. The slags invariably carry some value, probably due to a slight film of zinciferous lead which rises to the surface of the lead button and clings to the slag. A rough crushing of each slag on the buckboard is recommended, it being placed between two pieces of cloth to avoid losses. The lead buttons from the original fusion are cupelled with feathering, as in any bullion assay, and the cupel is afterwards ground and fused, its gold contents being added to that obtained directly. Each cupel need not be assayed separately, since, unlike the slags, the amount retained in them is very nearly the same in any one lot. So, usually two of them (taking only the parts containing absorbed litharge) are put together in a twenty-grain crucible and fused with this flux:

	Grams.
Sodium carbonate	40
Silica	10
Borax glass	10
Litharge	20
Flour	1



and a borax glass cover. The fusion takes a high heat and a long time, but finally a very perfect slag is obtained.

The gold-silver prills obtained from the original cupellation are weighed and then inquarted up to the regulation two and one-half parts of silver, the subsequent parting and weighing of gold being the same as in the assay of Dore bullion. When the inquartation is made on a cupel this cupel is also to be assayed and its absorption added to the main figures. In Mercur practice all these corrections are applied for gold only, the amount of silver present being insignificant.

(TO BE CONTINUED).

The "Hula Hula" Rocker.

The machine herewith illustrated consists of a wooden box mounted upon ball and socket bearings at each end and having its motion imparted to it through a gear and pinion which are operated by a crank handle. The shaft which carries the pinion is eccentric and carries a weight on one side which throws it out of balance and causes the effect of the pan motion, while the rocking motion is obtained by means of a yoke which is attached to the upper end of the box and which rests in a ball and socket joint on the lower frame of the machine. There is a screen box, similar to that used in the ordinary rocker, at the upper end of the machine, and below this two riffles inclined in opposite directions, and the bottom of the machine is covered with a strip of carpet. The force of the movement of the machine is regulated by the speed at which the handle is turned and is under the control of the operator. It can be made heavy or light at will, the machine being thus intended to be adapted to the working of the heaviest sands or lightest cements. It weighs 115 pounds; can be taken apart and transported anywhere by hand; no wrench or screwdriver is required in taking it apart or setting it up. The price of the "Hula Hula" rocker, complete, is $30, delivered f. o. b. It is furnished by Parke & Lacy Co., sole agents, 21–23 Fremont street, San Francisco, Cal.

The "Hula Hula" Rocker.

MINING SUMMARY.

ALABAMA.

Following are 1899 mineral statistics of production: Coal, 7,484,763 short tons; coke, 1,798,612 short tons; pig iron, 1,083,905 long tons; iron ore, 2,627,000 long tons; stone for flux, 635,514 long tons; building stone, 63,614 cubic feet; bauxite, 14,144 long tons; lime, 225,000 barrels; graphite, 50 to 60 short tons.

ALASKA.

A. H. White, at Gravena island, is developing a gold and copper mine. He will have the first stamp mill in operation in the Prince of Wales island section, having purchased a 20-stamp mill.

Chas. G. Yale, the statistician of the U. S. Mint at San Francisco, states that the returns show that the district of Alaska has more than doubled its bullion product in the last year. The receipts of Alaska gold at mints, assay offices, refineries, smelters, etc., for the calendar year 1899 were $5,602,012 and silver $229,343, a total of $5,831,355, or $3,199,844 more than in the year 1898. Of this increase it is estimated that $2,400,000 came from the new placer camp at Cape Nome last season, the first year in its history, and the rest of the increase from the quartz mines of southeastern Alaska. The placer camps along the Yukon river give evidence of only slightly increased yield for the year. In southeastern Alaska, including Douglas and Unga islands, the quartz mines are now operating 1050 stamps and employing 1308 men, at average wages for miners of $2.50 per day and board. The combined output of these quartz mines for 1899 was $2,704,176 out of a total of $5,831,355. This makes the yield of the placer mines of the district of Alaska $3,127,179, of which $2,400,000 came from beach and tundra claims at Cape Nome and the remainder, $727,179, from the placer camps along the Yukon river and its tributaries, placers near Golovin bay, the beach-sand mines at Lituya bay, the hydraulic mines near Juneau and the claims in Porcupine district, southeastern Alaska.

The Secretary of War states that no more permits for deep-sea mining at Nome will be granted until Congress has acted on the Alaska civil government bill. Under one section authority to grant such permits is taken away from the Secretary of War.

Mgr. C. Plaut of the Latauy Bay Placer M. Co. says he will have a dredger brought up, capacity 2000 yards per day, to use this season.

The latest advices from Cape Nome are to the 24th inst. The usual report of fresh discoveries are of course to hand to increase the crowd who are flocking up there, 99 out of 100 to be cruelly disappointed.

The fuel supply at Nome up to Jan. 24th was a serious problem. Wood was bringing $40 per cord and $125 per ton was asked for coal.

T. D. McDermott reports finding a quartz ledge on Basin creek, 12 miles from Nome, that assayed $250 per ton.

Chas. Crane is working the beach sands with a steam thawing plant.

ARIZONA.

APACHE COUNTY.

The bill opening for mineral operations that portion of the Navajo Indian reservation in north latitude 36° 30′ has passed both houses of Congress. The portion of the reserve opened contains some mining prospects, and Colorado and Utah people are expected when the formal opening takes place.

COCHISE COUNTY.

Benson Press: From Cochise station, in the Dragoon mountains, the Peabody mine ships weekly seven carloads. From the St. George mine five tons are shipped each alternate day. A number of claims are shipping wolfram.

The Black Diamond Co. will push work on its property in the Dragoons. Supt. Henry will put in an air compressor plant, four drills and other machinery. Test shipments give good copper values. One average test of 1000 pounds shows 17% copper.

GILA COUNTY.

At Globe the Old Dominion is daily receiving ten cars coke. The smelter is now turning out from 75 to 85 bars (300 pounds each) of black copper daily. The company has purchased the Rochester and Uncle Sam mining claims.

Prof. Douglass of the United Globe has determined that the ores are not suited to smelting, and they will ship on to El Paso. Supt. E. H. Cook of the United Globe mines has gone to El Paso to arrange for shipping ore to that point.

The Black Warrior Co. is working sixty men.

Supt. Collins of the Octave Co. at Stanton has bonded twenty claims west of Globe for $125,000, all to be paid within nine months, and is working twenty men under the management of P. J. Cole of Phœnix.

MOJAVE COUNTY.

The Juno mine at Chloride is reported in bonanza. A new concentrator has been ordered.

PIMA COUNTY.

At Helvetia Mgr. J. B. Seager says he has water enough for the season's operations. The daily capacity of the smelter is 175 tons. He will put in a dynamo and have electric lights for all needs. The town has 1200 people. The pay roll numbers 420 now.

PINAL COUNTY.

At the Ray mine the 250-ton concentrating plant is expected to be ready to run June 1. The ore railroad is now in operation, running from the mines to the mill, and the traction engines are being successfully operated in carrying the freight of the company from Red Rock on the Southern Pacific to the works on the river; R. V. Truman, Mgr., N. B. Wilcox, superintendent construction.

CALIFORNIA.

AMADOR COUNTY.

The Shenandoah Con. M. & M. Co. has incorporated; capital stock $200,000, $9000 subscribed; E. B. Cutter, E. W. Ferguson, T. J. Parsons, J. Dolbeer, G. D. Gray, S. K. Thornton, E. S. Hadley, S. Rosenbaum, T. Kilpatrick.

CALAVERAS COUNTY.

C. M. Burleson, Supt. Vorlander mine, wants sealed proposals for drifting north and south along the vein on the 150-foot level.

At Murphys the De Lay tunnel is in 600 feet. Supt. Tucker is developing the Big Horn mine, at Murphys, and intends to erect machinery this season.

The Melones tunnel is now 2700 feet in length.

Chronicle: Two hundred tons of ore are being hauled from the Commodore mine, near San Andreas, to the Ford mill to be put through as a test. It is said that if the rock will average $4 to the ton, a 60-stamp mill will be erected at once.——The ore shipped from the Eudora at West Point yielded $135 to the ton. It cost $20 per ton to haul from West Point to the depot and $20 more for railway transportation and reduction. Nearly all the mines of West Point district are high-grade though rebellious ore, the drawback being the heavy cost of transportation.

EL DORADO COUNTY.

Mgr. Vance at the Starlight mine keeps the 10-stamp mill running steadily. It is owned by Hawley Bros. of San Francisco. Mr. Neilson is underground Supt.

The Oro Fino mine is run by water power of 150 inches from the Park Canal Co.'s ditch. The shaft is 700 feet. The 30-stamp mill is kept running night and day; 125 feet hydraulic pressure in 13-inch pipes runs the hoist, mill and chlorination works. Ninety tons ore every twenty-four hours yields $6 per ton.

INYO COUNTY.

At Darwin the Lane mine is working twelve men. The Defiance mine has resumed.

At Ballarat the World Beater has put up a mill.

Searle's Borax Works are producing 100 tons per month.

KERN COUNTY.

The Big Blue gold mine, near Kernville, is sold to Senator J. P. Jones, for $75,000.

MARIPOSA COUNTY.

At the Francis mine Supt. L. Wagoner is locally credited with intention to put up a 10-stamp mill.

At the Mariposa mine the east drift is in 170 feet. The ore runs $12 per ton. Next week a station will be cut at the 475-foot level and a drift run to the east to determine the size of the ore body through which the 275-foot level is being run.

At the Princeton mine the bottom of the old works was struck at 550 feet last week. The bottom of the old works has now been reached in each of the five grant mines, and next week work in new ground will be pushed in all of them.

Mariposan: F. A. Brown of Coulterville has placed the Pleasant Valley water right on the Merced river with C. E. Hahn of the Columbus Co. It will carry 20,000 inches of water with 150 feet of fall. Mr. Hahn is grading for a 20-stamp mill, to be erected at once. A 30-foot dam is to be constructed on the above-mentioned water right 4 miles below Benton mills, a flume carrying 12,000 miner's inches of water per minute to be built from the dam to Horseshoe Bend, where the electric power plant is projected.

MONO COUNTY.

Mgr. E. J. Andrews of the Dunderberg mines, Bridgeport, has paid the balance of $20,000 due on the bond given for the Dunderberg, now owned exclusively by A. D. Cullum of London, who has named the mine the Castle Peak, and will further develop and improve the property.

The Red Cloud mine at Bodie is now owned by J. B. Haggin, Mrs. Phœbe Hearst, P. Reddy, W. H. Metson and J. Cain. Work has begun for a new hoisting works.

NEVADA COUNTY.

(Special Correspondence).—The experts in the lawsuit between the Grass Valley Exploration Co. and the Pennsylvania Co. have about completed the preliminary work and the case will come to trial shortly. The Grass Valley Exploration Co., who own the W. Y. O. D. mine, claim the ore worked and now being worked by the Pennsylvania mine. Ross E. Browne and W. F. Engelbright are experting for the Pennsylvania mine; Louis Janin and Mark B. Kerr are doing the same work in the interest of the W. Y. O. D. mine. Messrs. Curtis Lindley, Searls and Kitts are the lawyers for the Pennsylvania Co. and Judge John Garber and P. F. Simonds are retained by the Grass Valley Exploration Co. It is expected the case will bring up some new and important facts in mining decisions.

Grass Valley, April 24.

The Jenny Lind M. Co. has levied assessment No 2 of 1 cent per share upon its capital stock.

Supt. J. W. Morrell, Hudson mine, Rough and Ready district, tells the Herald he has bought for his company 190 acres more, which gives the company 210 acres of surface.

Union: Geo. Mainhart has sold the Erie group to O. A. Turner, who will build a 20-stamp mill and develop the property.

PLACER COUNTY.

(Special Correspondence).—The Hidden Treasure, with its main work at Centerville, eight miles from Iowa Hill, is the most extensive gravel mine in California. This company began operations at Sunny South, three miles from Centerville, twenty-two years ago, and until 1896 prosecuted its work through the tunnel terminating at the former place. Eight thousand feet from the mouth of the tunnel the channel of white quartz gravel was cut off abruptly by a blue gravel lead that was being worked as the "Dam Claim." This latter claim was purchased by the Hidden Treasure Co., and since the purchase of that and contiguous ground, operations have become focused at Centerville. The white gravel channel was rediscovered 60 feet beyond the blue gravel cut-off, and both channels, each upon its own level (varying 25 feet), are now being worked by the Hidden Treasure Co. Some rich gravel is now being taken out of the "black channel," or the original Dam claim, which encourages the company to continue its development. It is to prosecute this work that an electric hoist was recently put in. The difference in the gravel is strongly marked. In one channel it is loose, white and friable, and can be breasted out with pick and shovel; in the other channel it is strongly cemented, requiring powder blasts to break it down. The tunnel which runs into the hillside from Centerville strikes the white channel 8000 feet from its mouth, following the level of the Dam tunnel 6000 feet, and then branching off, and rising by an easy grade 25 feet within the next 2000. At this latter point the gravel is being extracted to the extent of 225 to 250 carloads per day (twenty-four hours), and is hauled to the mill in trainloads of fifteen to thirty cars by means of an electric trolley line. Ten trips per day are made. It is dumped from the cars by hydraulic connections, and falls into the bins, where it is sluiced into the flume leading down the canyon. All of the operations of the mine are systematic. It is a regular dividend-payer, and promises to continue such for many years. H. T. Power is the Gen. Mgr. and principal owner; M. Holt, Supt. About 200 men are employed, something more than half of whom are Chinese.

The Red Point mine, four miles from the Hidden Treasure, is an interesting gravel proposition. There is here one of the longest tunnels worked from a single opening that can be found in the State. This tunnel was driven into the hill for 2000 feet as a crosscut; here it struck the locality of the gravel channel, and this it has continued to follow for a distance, in the aggregate, of three miles. In a tunnel so long as this, ventilation is an important factor. This is accomplished by blowers, which force pure air to the face of the tunnel. The gravel is strongly cemented, in a channel averaging 70 feet in width, but slacks quickly upon exposure to the atmosphere, and then washes freely. Three thousand carloads per month is the output. The cars are propelled by a compressed air locomotive, there being a charging station at the mouth of the tunnel, and another at a central point inside. Fourteen cars of one-half-ton capacity each constitute a load, and these are run at a speed of fifteen miles per hour. The air is compressed at power houses located in the steep ravine below the mine. Water which runs out of the tunnel (unvarying in amount through the entire season) is utilized twice under a fall of 500 feet in each instance, creating ample power for the purpose required. A French syndicate owns the Red Point. Seventy men are employed, with J. A. Ferguson as Supt.

Iowa Hill, April 14.

Boston News Bureau: The Pioneer M. Co. held a meeting Saturday. The mine was closed down on April 5th and only three men are now employed there. The company's surplus has shrunk from $50,000 to about $1000. The directors represent 10,000 shares of stock and suggest that an assessment of 50 cents per share be levied. The stock is non-assessable under Montana laws except three-quarters of the stockholders agree to an assessment. It was the sense of the meeting that the company be reorganized, and it was voted to refer the matter back to the directors with the request that they devise a plan of reorganization.

Boston News Bureau: The directors of the Pioneer M. Co. are expected to meet this week to discuss plans for financial relief. A director says: "I personally favor the calling of a 50-cent assessment, payable in two installments of 25 cents each. If $25,000 is sufficient, and I believe it will be, why of course the remaining $25,000 need not be called. I am decidedly opposed to running the company in debt. We recently ran the mill, twelve hours a day, but the rock was of so low grade that only $2600 in bullion was produced. We have been expending our treasury funds at the rate of about $5000 a month. Additional funds must now be raised with which to continue our explorations for profitable ore bodies. I believe such ore bodies exist in our property, but it will take money to find them."

PLUMAS COUNTY.

H. W. Hammond of the Plumas D. & M. Co. of Pittsburg, Penna., is at Johnsville, examining the Thompson or Mammoth quartz mine.

SHASTA COUNTY.

F. Iler, one of the owners in the property operated by the Elizabeth G. M. Co., near Iron Mountain, talks of a 40-stamp mill at the mine. He says there has accumulated several thousand tons that will assay $4 to $5 a ton, and that the pay quartz is worth $8 a ton.

Mineral Wealth: The Midas mine at Harrison Gulch has a continuous pay shoot over 3300 feet in length. While the ledge varies in size considerable throughout this length, the ores are of continuous high grade, and are all crushed in the mill.

SIERRA COUNTY.

W. E. Howell will operate the Pilgrim mine, five miles from Forest City. A 20-stamp mill will be built there.

SISKIYOU COUNTY.

Yreka Journal: A Pittsburg, Penn., company has bonded two miles of ground at Callahans, in South Fork of Scott river, for dredging, and will put in three dredgers, one along the bank on each side, another in center of stream.

TRINITY COUNTY.

The Cie Fse mine will have a good supply of water for two months yet. The La Grange mine also has plenty of water and is working a large force of men.

The Heurtevant mines on Red hill have done well this season.

At Dedrick, 12 miles from Junction City, all the quartz mines are looking well. There is to be another mill built on the Maple mine, owned by Homer Wilson of San Francisco.

Searchlight: At Junction City the water supply for small mines is low and the season is almost over.

Mineral Wealth: A 40-stamp mill will be built at the head of Jerusalem creek to crush the ores from the Bullychoop mine. These mines are located on the Trinity county side, but will be opened from the Shasta side of the line by tunnel. The Mountain G. M. Co., organized under laws of Arizona, will operate the property. The company will build a wagon road to the mill site. Work on the lower tunnel, which will cut the ore 500 feet below the present lowest level, has begun.

TUOLUMNE COUNTY.

At Quartz the App and Dutch mills are to have each twenty more stamps.

Sonora Democrat: Eight tons ore from the Hope mine netted S. Ralston $90 per ton.——At the 250 level the Densmore reveals a richer body of ore than heretofore encountered.——This week a test run on six tons of ore from the Draper mine was made at the Bonanza mill. The test was eminently satisfactory and an agent has gone below to purchase machinery for the mine.——The Goldwin mine property is in shape for operations. This week contracts will be signed for equipping the mine with all necessary machinery.

COLORADO.

BOULDER COUNTY.

Despite the many warnings in this paper of the danger attending careless thawing of giant powder, the following deplorable occurrences continue to be chronicled: On the 16th inst. Andrew Wise, aged sixty-five, and his son Joseph, aged thirty, were instantly killed by an explosion of giant powder at the shafthouse of the Eldorado tunnel, near Sunshine. John Walmsley, a blacksmith, was badly injured at the same time. Wise was thawing powder in hot water when 150 pounds exploded. The father and son were literally torn to pieces. The building 50x100 feet, was wrecked. Walmsley was badly bruised and his arms and head were torn by splinters.

Mgr. Teal of the Pennsylvania mine and mill, Ward district, has a retort of gold weighing eight ounces, representing the savings on the plates at his company's new mill for a two days' run, which pays the expenses of mining and milling seventy tons of ore. The profit is in the concentrates from this first run of two days, amounting to about eight tons running $40 a ton. Five men can keep the 40-ton stamp mill going, the work being almost entirely automatic. Mr. Teal says he can load the ore and convey it to the stamps for 5 cents a ton.

CLEAR CREEK COUNTY.

Near Idaho Springs the Gen Extension vein has been cut by the Newhouse tunnel at a depth of 2000 feet, giving 1500 feet of new stoping ground. The vein carries three streaks from 10 to 12 inches wide of smelting grade. The ore runs in copper and lead, as well as gold and silver. The tunnel is now 8800 feet in length and will be extended 2500 feet from the present breast to cut other veins.

Post: Idaho Springs reports another strike in the Newhouse tunnel, the Gem Extension vein having been cut. That property has been operated for the past eight years under the management of W. E. Renshaw. The vein where cut in the tunnel is at a depth of over 2000 feet, and, as the shaft is down to 600 feet, considerable work must be done to connect the upper workings with the tunnel. A contract has been made with the tunnel company whereby work on an upraise will commence as soon as the breast of the tunnel is far enough ahead, so that the work will not interfere with the pushing ahead of the tunnel. The shaft has recently been enlarged and retimbered and sinking will commence at once. An air compressor will be put in to carry forward the work of development, and at a depth of 700 feet a hoist will be installed which will be operated by compressed air. This independent hoist will be lowered every 200 feet the shaft is sunk, and levels will be driven 100 feet apart; by this means the development can be continued and at the same time a large force of men can be engaged in getting out the mineral from the various openings. The vast amount of ground that will thus be opened will give employment to many men. The cutting of the Gem vein will open up ore bodies at the greatest depth in this county, and proves the theory often advanced by mining men that what this section needs is deep mining, and this has proven true in every case where any great depth has been attained. The Newhouse tunnel has now reached a point nearly 9000 feet from the mouth, and it had been estimated that the Gem should have been encountered nearly a month ago; but this delay is now explained, as it is found that the pitch of the vein changes with depth and dips considerably more to the north. The breast is about under the Clear Creek–Gilpin county line and is being pushed ahead at the rate of over 200 feet per month, working one shift of two air drills.

GUNNISON COUNTY.

Near Vulcan, at the Dubois tunnel air drills are now used. The tunnel is about 1000 feet in the hill and at 300 feet farther will reach the Pride of Denver vein. Several small veins have been cut.

LAKE COUNTY.

S. P. Brown of Twin Lakes has sold the Gordon mine for $200,000—$50,000 down—to D. E. Murphy of Milwaukee, F. C. Smith of Deadwood and O. Williams of Denver, who have incorporated the Gordon-Tiger M. Co., of which they are the directors. They will erect a stamp mill within six months.

OURAY COUNTY.

A 5000-foot aerial ropeway, with an elevation of 1809 feet between terminals, is to be built at the American–Nettie mine, near Ouray. When the new mill, now building, is completed the number of miners employed will be increased from 30 to 100.

ROUTT COUNTY.

The manager Hahn's Peak & Leadville M. & I. Co. says the company has decided on plans for next season's work on its interests in Columbine basin, on the western side of the peak.

SAN MIGUEL COUNTY.

The new Smuggler and Bessie mills are now both in operation and are supplying 300 tons of ore to the daily Telluride product.

SUMMIT COUNTY.

Mr. W. C. Tracey of Kokomo, working the Mountain Lion, wants to know the best way to handle the ore. It is a blanket vein in a porphyry dike, carrying gold, silver, lead, iron and copper. It is low grade, worth $6 or $7 a ton, and is silicious. It will concentrate six tons into one.

TELLER COUNTY.

(Special Correspondence). — The big snow blockade is a thing of the past. With commendable promptness the roads cleared their lines for business and there has been but a ten days' delay. The smelter situation is still the topic. Much praise is accorded the Guggenheims for their $20 proposition because, while the Pueblo smelter capacity is at present limited, yet the intimation to the trust that they can't run things is too strong to escape their notice, and the general Cripple Creek opinion is that the trust will "come down," or, rather, come up to the Guggenheim offer. The plea that they have to pay more for coke is pretty well discounted by the general knowledge of profits at former rates. The Guggenheims are getting hold of lead-producing properties for flux, and expect to be able to make a stand for good. It is thought that if the smelter trust can be firmly met the mill men can also reduce rates.

Cripple Creek, April 21.

Cripple Creek mine owners who have been supplied with compressed air for running machine drills by outside corporations object to the advance of 50% and talk of putting in their own compressors.

Circular letters from the Philadelphia smelter at Pueblo have been received by mine and sampler managers offering to take Cripple Creek ores at the old rate. Twenty dollars an ounce will be paid for the gold, and a treatment charge on contract ore of from $9 to $10 is offered, and on other ores not under contract an advance of $1 a ton will be charged. It is the general belief that the smelter trust will be compelled to meet this rate, and that the mill owners will also advance the price for gold and reduce the treatment charges. The smelter trust is now paying only $19.50 for gold. This means a loss to the Isabella, Portland, Stratton's Independence and other mines that have been shipping ore that runs all the way from 400 ounces a ton in carload lots.

The Globe Hill Con. G. M. Co. has sold to D. H. Rice, for W. S. Stratton, the Happy Boy, Foggy and Goodenough claims on the west slope of Gold hill for $75,000 cash.

Cripple Creek Times: The new machinery is arriving at the Gold Coin mine, and it is expected that it will be in place and in operation by Sept. 1. Mgr. H. E. Woods states that when the machinery is up the mine will be capable of outputting $450,000 worth of ore per month, or over $5,000,000 a year. It is said that the development in the seventh level of the Gold Coin breaks the record of the wealth in deep mining and makes the Gold Coin the largest claim mine in the district.——M. W. Levy & Co. have bought the Ide lode on Bull hill for $20,000.——Another new ore sampler near Goldfield is to be located on the east slope of Battle mountain, near the National, to be known as the Eagle Gold Ore Sample Co. The cost will be about $18,000.——The Madison G. M. Co. has sold its properties for $35,000 to C. W. Kurie.

IDAHO.

Chas. Sweeney of Spokane has bought the Big Buffalo mine at Buffalo Hump for $200,000.

BOISE COUNTY.

Near Idaho City is a large deposit of gold gravel worked under lease by Ballantyne & White. The bank is 110 feet high and solid gravel. The gravel averages 100 feet in depth; 3200 inches of water are used; three of the giants work under a pressure of 200 feet; four have 3½-inch nozzles. Of the three larger ones, two have 5-inch nozzles and the largest of the three a 7-inch.

IDAHO COUNTY.

George Connors, Supt. Hiyu mine, says the snow is going off rapidly. Preparations are being made to open the Hiyu.

OWYHEE COUNTY.

(Special Correspondence).—The progress of the De Lamar tunnel, being pushed by Supt. D. B. Huntley, for the months of January, February and March, 1900, was 402, 398 and 402 feet, respectively, making the total length April 1st, 2958 feet.

De Lamar, April 19.

MONTANA.

BEAVERHEAD COUNTY.

The Birch Creek C. M. & S. Co. is organized by Butte men to operate the Indian Queen mine, on Birch creek, 12 miles from Dillon; T. Ellis, secretary. A shipment of two carloads to the Colorado smelter at Butte showed 12% copper.

CARBON COUNTY.

At Red Lodge the miners' union has accepted the schedule of wages submitted by the new management of the Rocky Fork coal mines, and the miners will resume work at once. The new schedule gives the men practically all they asked for. The new management will make preparations to double the output of coal, which means employment for 700 men.

MADISON COUNTY.

At the Madisonian mine, near Sheridan, the plant will be increased by the addition of machinery from the property at Leiterville, which was recently abandoned. Supt. Trerise will sink 200 feet farther.

TETON COUNTY.

At Swift Current, A. M. Sessler has selected sites for two 100-ton concentrators, one on the Crocker system of leads, the other on the Bullshead system. Men are at work getting out timbers for the Crocker concentrator, and construction will begin on the arrival of a sawmill. It is expected both concentrators will be finished before Dec. 1. Work on the Josephine began April 20.

NEVADA.

ELKO COUNTY.

Near Wells, at the Contact mines the hoisting plant is in operation and a smelting concern is ready to commence operations as soon as sufficient sulphide ore is produced.

The Starr M. & M. Co., with headquarters at Cherry Creek, employs 150 men and has increased its milling capacity by an additional twenty stamps. A car of concentrates was recently dispatched from Wells, but the bulk of shipments goes by way of Toano, five 12-mule teams being on the road.

From Sprucemount (gold, silver and lead), forty miles south of Wells, a carload a week is the shipment from that point. Mgr. Hartley assesses the average net value of a carload at $1000. He intends to put in a large hoisting engine.

EUREKA COUNTY.

A suit has been filed asking that a receiver be appointed for the Whalen Con. C. M. Co., and that its officers be enjoined from selling or converting any of its stock. The complainants say that defendants have conspired to discredit the company and to depress the value of the stock, so that they could later obtain control of it at a low price.

STOREY COUNTY.

The Truckee River General Electric Co. has been notified by the Westinghouse Co. that the latter will be ready to ship the first of the machinery for the power house at Floriston May 15, and that they expect to ship the remainder before June 4. The company expects to turn on the electric current and supply power to the Comstock mines by Aug. 1.

WHITE PINE COUNTY.

The Salt Lake Tribune reports F. H. Blake and J. H. Marriott as examining the hubnerite deposits at Osceola, at the foot of the west side of Mt. Wheeler. It is shipped to Philadelphia, where it is made into tungstic acid, used in the manufacture of steel. It brings $300 per ton laid down in Philadelphia. The expense of mining is not great, but the haul of 95 miles to Frisco, Utah, is.

NEW MEXICO.

GRANT COUNTY.

The San Jose Concentrating Co., at Gold gulch, has its mill completed.

SANTA FE COUNTY.

The experimental gold saving plant at Dolores, on the Ortiz mine grant, is nearing completion and it is expected will be started up next week.

SOCORRO COUNTY.

Sixteen men are employed on the Cooney mine at Mogollon.

The Kat and Kittens Co. at Mogollon has completed a run of 300 tons of ore which went $20 per ton in gold and silver.

The Last Chance Co. at Mogollon is running a crosscut tunnel. New machinery will be placed in the old mill.

TAOS COUNTY.

Wm. Brandreth of 71 Broadway, New York City, has selected a site at Amizette for a 40-stamp mill. He also plans a power plant there and says he will build a custom mill in addition to the 40-stamp mill.

OREGON.

BAKER COUNTY.

The Buffalo G. M. Co. has recently incorporated at Sumpter. The incorporators are F. A. Williamson, A. Mohr, W. Finn, W. H. Emes, M. G. Haskell; capital stock $100,000.

JOSEPHINE COUNTY.

The Harris gold dredger, eight miles from Waldo, is dredging 200 acres lying along the Illinois river, daily handling 1000 cubic yards gravel.

Mgr. Jno. Wickham of the Big Yank M. & M. Co. of Galice has a property yielding copper, with traces of gold. The copper runs 8½% and the silver about $1.75 a ton. He intends to put in a smelter.

GRANT COUNTY.

W. L. Vinson and T. K. Muir failed to meet their last payment on the Magnolia mine; the property has reverted to its original owners. The purchase price of the Magnolia, which was operated by Vinson and Muir for an English syndicate, was $25,000. Over half of this amount is said to have been paid. The mill erected by the purchasers cost $25,000, and other improvements about $25,000 more. For a time the mill was operated successfully, but later about two-thirds of the values were lost through unsuccessful methods of ore treatment.

SOUTH DAKOTA.

CUSTER COUNTY.

At Custer City the Chicago Mica M. Co. has a mica grinding mill of ten tons daily capacity. The company expects to ship three carloads per month.

UTAH.

BEAVER COUNTY.

(See Illustration front page.)

(Special Correspondence).— The Horn Silver is the historic mine of this section. It was opened nearly thirty years ago, since which it has produced over $30,000,000. The location is in a low range of trachyte and dolomite lime and is reached by the Oregon Short Line, a spur of which runs from Milford to Frisco, 17 miles distant. On page 457 is presented an illustration which conveys some ideas of the surface improvements and the general appearance of the country.

The Horn Silver ledge runs north and south and stands in a nearly vertical position. One main shaft sinks 1600 feet vertically, from which crosscuts run westward about 100 feet to the vein. There are stations at the 300, 500, 700 and 900, and at each 100-foot level below the ninth. The 1600-foot station is at the water level, below which is a sump, from which several thousand gallons of water are bailed each day.

The ledge, from wall to wall, is from 30 to 100 feet wide and is opened about 3000 feet on the strike. On the seventh a drift runs northward from the shaft 2260 feet. The first workings were in an open cut along the outcrop. Some thirteen years ago a cave-in occurred, extending from the surface to the seventh level, and lengthwise several hundred feet, filling the stopes and drifts with a conglomerate mass of ore, waste and crushed timbers, grinding much of the siliceous material to a flour fineness. Much of the work of recent years has been directed to cleaning out the caved-in chambers and stopes, sorting the ore therefrom, retimbering in places and filling in the ground as it is worked over. This work proceeds from four to six sets high, the conditions requiring the heaviest and most thorough timbering. Below the seventh level the work goes on regularly, the stoped-out places being filled in from above and the timbers removed to a large extent. Ore is being taken from every level from the the surface down, excepting the sixteenth, where only development is in progress.

The ores from the surface to the seventh are largely lead carbonates, carrying also silver, gold, copper and zinc. At greater depth they become more of a copper and zinc sulphide, with considerable galena. In the upper workings a large tonnage of silver chlorides (horn silver) was obtained, from which the mine derived its name.

The report of the company for the year ending December 31, 1899, shows:

Sales of ore and concentrates		$217,204
Store at Frisco		15,000
Interest and rentals		2,815
Total receipts		$235,019
Mive expenses	$140,791	
Mill expenses	35,240	
General expenses	32,706	
Suspense account	699	
		209,436
Profit for the year		$ 25,583
Dividend No. 43 of 5c a share		20,000
Balance		$ 5,583
Brought forward from 1898		163,736
Surplus January 1, 1900		$169,319

The ore extracted and shipped and the

average values per ton of ore shipped were as follows, in gross tons:

	Ore mined.	Ore ship'd.	Value.
First class crude ore..	2,299	2,299	$20.17
Second class crude ore	1,010	1,010	9.92
First class copper ore.	1,612	1,612	45.45
Concentrating ore....	27,728	.....	.....
Concentrates	.....	3,581	26.47
Totals	32,649	8,502	$25.55

The total value of the ore shipped was $217,204. The cost of mining was $140,791, of concentration $35,240. The cost of mining per ton was: Labor on ore, $1.87; labor on dead work, $0.50; labor on surface, $0.70; supplies, timber, fuel, etc., $1.24; total, $4.31 per ton. The cost of concentration was $35,240, the cost per ton of crude ore being: Labor, $0.80; supplies, fuel, etc., $0.47; total, $1.27. The average concentration was 7.74 tons into 1 ton.

The products of the ore mined included 4,576,952 pounds lead, 717,120 pounds copper, 192,116 ounces silver and 310 ounces gold. The ore hoisted was 40,501 pit carloads; the ore shipped was 338 railroad carloads. Supplies used included 677,629 feet timber, 2583 poles, 2036 tons coal, 3344 cords wood and 339 tanks water.

The dead work performed included 825 feet drifting, of which 542 feet was on the 1100 level and 283 feet on the 1600 level.

Mgr. Farnsworth's report says: "In extending the drift north from the crosscut on the 1600 level about December 1, when out a distance of 160 feet, we encountered a flow of water of 20,000 gallons per day, which we use in the mill for ore concentration. No difficulty or inconvenience is experienced is raising this water to the surface, as we are well provided with tanks handled by the engine. Owing to the excessive drought which has prevailed for over a year the water supply became very much reduced, and we were unable to treat the usual amount of ore in the mill. That difficulty is now entirely overcome. No ore has yet been found on this level, although all indications point to the presence of copper. On the 1100-foot level the drift has been extended 542 feet, which is still in low-grade copper ore. None, however, has been found that will pay for handling in any way. The copper product, as shown in this report, is taken from the 700 and 800 levels. So far as we can determine now the output for the coming year will be much the same as that just closed. There are no important developments to report from any of the other levels. All are in excellent condition. The net profit from the mercantile business was $16,056, $15,000 of which will be turned over to the treasurer. The balance—$1056—will be used in reducing values of real estate, etc."

The mill, though not distinctly shown in the illustration, is equipped with thirty stamps, crushers, fine rolls, jigs and vanners, by which about 150 tons per day are reduced to 20 to 25 tons of concentrates. Six vanners receive the lead carbonates, while twelve others handle the zinc-lead sulphides. The ores cantaining the copper carbonates and copper sulphides are usually of high grade and are shipped direct to the smelter. The crude ores shipped run from 25% to 40% lead, 20% to 40% copper. The concentrates shipped run from 35% to 50% lead and thirty-five to forty ounces silver. The zinciferous ores are of importance here. They run as high as 45% in that metal. A shipment of 500 tons was recently made by way of Galveston, Texas, to Germany. The crude ore shipments to the smelter amount to 800 to 1000 tons per month. The gold values run from .4 to .6 ounce to the ton in the high-grade ore.

A feature of the power house is a heater and purifier, which precipitate the calcareous and other elements in the water before it passes to the boilers. It was devised by J. B. Fleming, now in charge of the Silver King mill at Park City. The plant includes a duplex compressor of twenty drills capacity. The mill tailings are impounded for some possible leaching process in the future. Settling vats are provided to secure the water, which is used over and over again. A force of 160 men is employed at mine and mill. P. T. Farnsworth, Salt Lake City, is Gen. Mgr. On the ground Josiah Osborne is mine Supt., with Mr. Richards in charge of the mill. A half mile from the mine is the old smelter, which ran most of the time from '70 to '80. WASCOTT.

Frisco, March 1.

SALT LAKE COUNTY.

E. W. Genter has sued the Conglomerate M. Co. for $10,000, alleged to be due for commission for negotiating a sale of the mining properties of the defendant at Bingham. He alleged that on February 3, 1899, he was employed by the defendants to procure a purchaser for the property, and that they agreed to pay him $10,000 for such service. Through his efforts, he said, the property was sold to C. A. Hight of Boston for $550,000, but plaintiff has not received his remuneration. The negotiations between Genter and the company were conducted by G. Lavagnino, as manager of the company, and the latter, for defense, alleged that Lavagnino had no authority to make such an arrangement on its behalf. Lavagnino alleges that the arrangement with Genter was that the buyer should pay him a commission of $50,000, half of which Lavagnino was to get. He then alleges that Genter, on that head, owes him $25,000, and prays for judgment for that sum.

JUAB COUNTY.

J. J. Watson, Supt. Eureka Hill mine, expects to resume operations about June 1st and to have the sixty stamps there at work. There are about 12,000 tons of ore on the dump. It is expected that at the mine and mill 250 men will be employed.

The Tintic Miner hears that the Sunbeam M. Co. will resume work by Sept. 1st under the direction of T. G. Weber of Park City. To the present plant will be added a new boiler.

WASHINGTON.

SNOHOMISH COUNTY.

Mr. Crooker, J. D. Rockefeller's representative, says that the Everett & Monte Cristo Railway will be rebuilt to Monte Cristo by June 1, and the Pride and Mystery mines again made productive. The cost of rebuilding the road is estimated at $50,000, and the statement is made that when it is completed 300 men will be employed in the mines.

WYOMING.

CARBON COUNTY.

A strike is reported in the Mohawk gold mine at Gold Hill, 25 miles from Saratoga, where rich ore has created interest in southern Wyoming and northern Colorado.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence). — Since the purchase of the Golden Cache property by the Toronto-Lillooet Gold Reefs Co., Ltd., that corporation has also acquired eight other mines adjoining. Gen. Supt. Rives is furnishing a large cyanide mill, the only one in the province, and has put in a mile of tramway. The ore is dried before crushing and rolls will be used instead of stamps. The company is entirely Canadian, with head office at Toronto.

Lillooet, April 20.

Nelson Tribune: During 1899, the Hall Mines smelter at Nelson produced 5390 ounces of gold, 672,706 ounces of silver, 1,508,786 pounds of copper, and 2,090,550 pounds of lead. The Canadian Pacific smelter at Trail produced during the same time 52,218 ounces of gold, 101,419 ounces of silver, and 2,578,717 pounds of copper. The value of this gold, silver, copper and lead was approximately $2,500,000, or about one-third of the total value of the gold, silver, copper and lead ores mined in Kootenay and Yale districts.

MEXICO.

Paco Garcia has sold to Thomas McCraw of New York the Picach de Bacanuchi mine, near Bacanuchi, in the Arizpe district, Sonora, for $150,000 in gold. The new owner will erect a mill and work the property.

Specimens of platinum have been received in the City of Mexico from placer mines in Sonora.

The reported sale of the Cecil Rhodes group of mines in Zacualpan district is denied by the London Bank, which, according to a report wired from the City of Mexico, was handling the business for Rhodes. The price was put at $4,000,000 gold.

THE KLONDIKE.

The receipts at mints, assay offices, private refineries and smelters for the calendar year 1899 from the Northwest Territory (Klondike) were $15,986,627 gold and $267,390 silver, a total of $16,254,107, an advance in output of $5,028,198.

Yukon hydraulic mining regulations have been amended so that any person who files an application in the Department of the Interior for a location previously prospected by him, or his authorized agent at the time the location was prospected, a lease will be issued, provided he is the first qualified applicant therefor. Before the issue of any such lease there shall be filed in the Department of the Interior at Ottawa a report from the gold commissioner to the effect that it has been proved to his satisfaction that the applicant himself, or a person acting for him, was upon and actually prospected prior to the date of the application, that ground included in the location is not being worked and is not suitable to be worked under the regulations governing placer mining.

Personal.

C. A. DONNELSON is Supt. Tubah mine, Panamint, Cal.

A. M. RUCKER succeeds J. L. Eby as foreman Bessie mine, Telluride, Colo.

CURTIS H. LINDLEY has returned to San Francisco from Washington, D. C.

W. W. HOLLAND succeeds J. W. Brown as Supt. Temescal mine, Tuolumne county, Cal.

F. R. ROBBINS, formerly of California, is now Mgr. North Star mine, British Columbia.

J. L. GIROUX, Supt. United Verde, Arizona, has returned from Sonora, Mexico.

G. T. MILNER is Supt. Zonia Copper Co. and Del Norte Copper Co., near Prescott, Ariz.

J. W. NEILL has resigned his position as Mgr. United States M. Co.'s mines at Bingham, Utah.

C. J. GRAHAM will superintend the operations of the Latauy Bay, Alaska, Placer M. Co. this summer.

WALTER PENNELL has charge at Mokelumne Hill, Cal., of the operations of the Standard Electric Co. at that place.

THE Trade Dollar Con. M. Co. has presented the general manager, Jas. Hutchinson, with a residence in Boise, Idaho.

GEO. S. KEAVINGTON is Supt. Mellin M. Co., Seward City, Alaska, and has begun the season's work with thirty men.

DR. CABEL WHITEHEAD, assayer of the Mint Bureau of the Treasury, has gone to Cape Nome to make report on conditions there.

J. A. FILCHER writes from Paris that the California State exhibit arrived in good shape, but few breakages having occurred.

HORACE F. BROWN, M. E., of Chicago has returned to San Francisco from an inspection of mining property at Sumpter, Or.

R. H. POSTLETHWAITE has returned to San Francisco from Oroville, Cal. Two of his gold dredgers are now operated by electricity.

SUPT. R. H. TRUMAN of the Ray mines, Arizona, and A. Hill of the London Exploration Co., have returned to the property from San Francisco.

H. A. COHEN is in Salt Lake City, Utah, engaged upon a report to determine the basis on which the Mercur-Golden Gate consolidation is to be made.

E. H. MEEK has resigned from the employ of the United Verde Copper Co., Arizona. He is now Gen. Mgr. Jerome, Ariz., Copper Co., and is at Oak creek to take charge of affairs.

ON the 18th inst. Gen. Mgr. Dickinson, Pres. Burt, E. H. Harriman and Jacob Schieff of the Union Pacific R. R. rode from Grand Island to Omaha—153 miles—in 152 minutes, making one stop. The time for 516 miles, Cheyenne to Omaha, was 10 hours 50 minutes. Gen. Mgr. Dickinson is now in San Francisco.

Industrial Notes.

—Consul-General Patterson writes from Calcutta: "I am constantly receiving letters regarding the manufactures of the United States, inquiring how such manufactures can be produced, and requesting to be put in communication with our exporters. The imports into India last year amounted to about $270,000,000, and this is the great distributing point. The National Association of Manufacturers of the United States is doing efficient and practical work in the way of extending the foreign work of the United States by establishing warehouses at Caracas, Venezuela, and Shanghai, China, for the display and sale of goods made by members of the association. I have no doubt that if such a warehouse were established in Calcutta, with agents authorized to make sales, a very large trade would result."

—W. P. Wilson writes: "I take pleasure in enclosing you herewith a pamphlet just prepared by the Philadelphia Commercial Museum, covering the conversion of United States weights and measures and moneys into foreign weights and measures and moneys. This information has been prepared especially for the American manufacturer seeking export trade. As the metric system in exporting to most countries is absolutely necessary, it has occurred to us that you might find use for the pamphlet, and might care to give it mention in your columns, inasmuch as it is being distributed to American manufacturers without cost, and in furtherance of the work of the institution, which is solely that of fostering American export trade." The pamphlet gives valuable information in a convenient form. Every manufacturer might well have one on his desk.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING APRIL 17, 1900.

647,714.—SNAP HOOK — G. L. Baker, Waterford, Cal.
647,552.—FURNACE—C. H. Bennett, Los Angeles, Cal.
647,595.—POULTRY ROOST—C. Burrows, Phœnix, Ariz.
647,895.—URINAL—E. E. Burson, Los Angeles, Cal.
647,806.—NUT LOCK—G. W. Cleveland, Little Rock, Wash.
647,671.—DOOR CONTROLLER—M. A. De Lew, Sacramento, Cal.
647,651.—GAS ENGINE—W. R. Dow, Boulder Creek, Cal.
647,816.—MOLDING MACHINE—J. C. Dressel, Fresno, Cal.
647,745.—LAMP—Eldridge & Smith, Stockton, Cal.
647,828.—WEEDING MACHINE—F. S. Gunning, Dalles, Or.
647,658.—BUTTER CAN—J. A. Hall, S. F.
647,921.—SQUARE, LEVEL, ETC.—E. W. Hutchinson, S. F.
647,841.—INK WELL HOLDER — F. D. Jones, Los Angeles, Cal.
647,722.—TOBACCO PIPE—W. B. Kennell, Tacoma, Wash.
647,845.—FIRE ESCAPE—A. J. King, Orcas, Wash.
647,504.—PIPE BOILER—W. MacFarlane, Seattle, Wash.
647,605.—REAMER—C. A. Mentry, Newhall, Cal.
647,678.—CHARGING LEACHING VATS—C. W. Merrill, Alameda, Cal.
647,682.—FILTER—R. C. Reed, S. F.
647,532.—FRUIT CORER — D. E. Sharp, Los Gatos, Cal.
647,685.—PIPE WRENCH—J. Stewart, Ft. Defiance, Ariz.
647,618.—GAS GENERATOR—A. C. Swain, S. F.
647,620.—RAILWAY CHAIR—E. F. Taylor, Azusa, Cal.
647,638.—WAVE MOTOR—G. N. Todd, Los Angeles, Cal.
647,772.—TOWEL MOISTENER—Townsend & Shelby, Watsonville, Cal.
647,711.—COMB FOUNDATION—H. Vogeler, Newcastle, Cal.
32,540.—DESIGN—G. M. Light, Pomeroy, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SPRING CLAMPS FOR BILLS OR ACCOUNTS.—A. W. Thierkoff, Redding, Cal. No. 646,510. Dated April 3, 1900. This device comprises an improved clamp for holding bills upon a cylinder drum described in a former patent. It consists of one or more clamps with a spiral spring and bail connection which forms an elastic movable fulcrum, so that either or both clamps can be lifted for the purpose of inserting or removing papers, and both clamps are held down by the action of the spiral spring.

GRINDING AND POLISHING WHEELS AND MOUNTINGS.—No. 647,063; April 10, 1900. James H. Adamson, West Melbourne, Victoria. This invention is designed as an improvement for cutting, grinding or polishing wheels and the mounting thereof, such as emery, tanite, corundum, or any grinding or cutting wheels of a material which has a tendency to disintegrate when running at a high speed. The object of this invention is to provide mountings for such wheels by which they are reinforced and clamped together by the use of casings made of steel, iron or other material having greater strength and in so arranging such clamped devices that new surfaces of the wheel proper may be exposed as fast as it becomes worn.

SELF-CLEANING FILTERS.—No. 647,682; April 17, 1900. R. C. Reed, San Francisco, Cal. Two-thirds assigned to H. Zadig and M. Blum, of same place. This invention has for its object such a construction of filter that unfiltered water can be drawn directly through the apparatus or the water may be filtered and stored for use, and the flow of water through the filter may be reversed in conjunction with a direct cleansing flow over the surface to be cleaned. The filter includes a tubular filtering medium, an inclosing case therefor, a spiral passage formed about and removable with the filter surface and along which the water flows to automatically cleanse said surface, and means for admitting water to and discharging it from said passage.

Latest Market Reports.

SAN FRANCISCO, April 26, 1900.

SILVER—Per oz., Troy: London, 27⅛d (standard ounce, 925 fine); New York, bar silver, 59¾c (1000 fine); San Francisco, 59¾c; Mexican dollars, 49c.

COPPER.—New York: Lake, 1 to 3 casks, 17.50 cash; carload lots, 17.25; Electrolytic, 1 to 3 casks, 17.25; carload lots, 17.00; Casting, 1 to 3 casks, 17.00; carload lots, 16.75. San Francisco: 17½@18. Mill copper plates, 21½c; bars, 23½@25c.

LEAD.—New York, $4.70; St. Louis, $4.60; San Francisco 5c, carload lots, 5½c, 1000 to 4000 lbs.; pipe 7½, sheet 8¾, bar 7c. London, Soft Spanish Lead, £17 = 3.70c per lb.

SPELTER. — New York, $4.80; St. Louis, $4.75; San Francisco, ton lots, 6c; 100-lb lots, 6¾c.

ANTIMONY. — New York, 9½c; San Francisco, 1000-lb lots, 11c; 300 to 500 lbs., 12@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 1, 10c.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 50@55c ℔ lb.

IRON. — Pittsburg, pig, No. 2, foundry, $23, gray forge, $21.50; San Francisco, bar, per lb., 3½c.

STEEL.—Billets, Pittsburg, $33; sheet bars, $37; San Francisco, bar, 12c to 20c per lb. Pittsburg wires two sharp cuts in iron and steel products have been made. Foundry pig iron, No. 2, offered at $19.50 a ton for early delivery. This is a cut of $3. Quotations on this product have been higher, but it has been possible for some time to get it at Pittsburg for $22.50. Open-hearth billets have been reduced from $40 and $42 a ton to $38 and $40. It was reported that a cut of $5 a ton in Bessemer pig had been made, but this lacks confirmation. While the price of Bessemer is $33, it is said that large contracts can be placed at $32.50.

QUICKSILVER. — New York, $52.00; London, £9 12s 6d; San Francisco, local, $51.50 ℔ flask of 76½ lbs. Export rates withdrawn.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

TUNGSTEN.—New York, ℔ lb., $1; San Francisco, $1.25.

FERRO-TUNGSTEN.—New York, 37c, 40c; San Francisco, 75c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, $125.

MAGNESIUM.—New York, $3.00 ℔ lb.; San Francisco, $4.00.

ZINC.—San Francisco, 6c; slab, 6½c; bar, 8c.

TIN.—New York, pig, $31.25; San Francisco, ton lots, 34c; 1000 lbs., 34½c; 500 lbs., 35c; less, 36c; bar tin, ℔ lb, 40c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

NICKEL.—New York, 45@50c ℔ lb.

BISMUTH.—New York, ℔ lb., $1.70 50-lb lots; San Francisco, $2.50 to $2.75 lb lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ℔ set; 14 oz., 40s., 10½c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 33@35c ℔ lb.; carloads, 31@32c; in 10-lb. tins, 40c; sulphuric acid, 2½c ℔ lb. 66% B; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1⅞@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

COAL. — San Francisco coast, yard prices: Wellington, $8; Seattle, $7.00; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50.

SOLDER. — Half-and-half, 100-lb. lots, 21½c; San Francisco, Plumbers', 100-lb. lots, 18½c.

Commercial Paragraphs.

H. KNOX AND C. H. GRAY of San Leandro, Cal., go to Cape Nome with a gasoline engine from The Daniel Best Mfg. Co. of San Leandro.

THE concentration of the tailings at the chlorination plants which run on Cripple Creek ores has become a saving factor of some importance. The National, El Paso and Gillett mills operate Wilfley tables for this purpose. The high degree of concentration effected is represented by the ratio of 100 and 150 to 1. As a general proposition these tailings run not less than $1 per ton, and in many cases much higher. It is figured that the concentrators save at least 50% of those values. In most cases the concentrators are operated as a part of the mill, but in one or two cases the tailings are worked in a separate plant by lessees, who pay a royalty.

GATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

CHICAGO, ILLS., Jan. 18th, 1900.

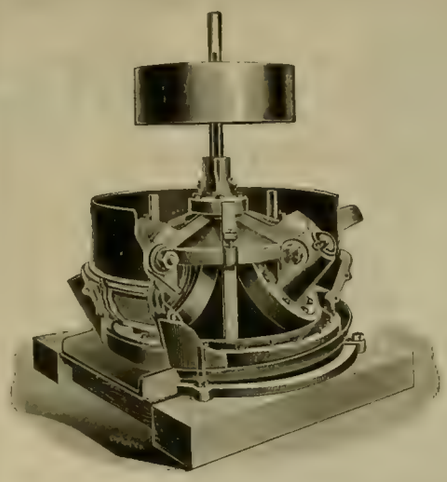
GATES IRON WORKS, CHICAGO, ILLS.

MY DEAR SIRS:—

Replying to your letter of the 17th inst., asking what we have done with the Tremain Mill at the Storm Cloud Gold Mines near Prescott, Arizona, in the past year, will say that we have been unable to run the Mill more than three days out of the week, owing to the fact that we have had, during the past year, but little rain. We were obliged to use settling tanks and save what little water we had, in order to run three days per week. The Mill has worked splendidly—in fact, it is a perfect little giant to do business with, where you have plenty of water for amalgamating purposes.

Enclosed I hand you a statement amounting to $20,210.72, which is the total product of the Mill for the twelve months, giving dates that we sent the bars to the mint at San Francisco and the amount we received for each bar.

I think the Tremain Mill is the best friend that a prospector or an individual who has practically a good mine can get hold of, to furnish him money to develop his property. I bought the Storm Cloud Gold Mines the last of June in 1897. In the fall of that year I bought, as you know, one of your Tremain Mills. From the day I started it it has paid all my developing expenses, and from the report made by the geologist of Arizona, December last, I now have $940,000 of ore blocked out, the expense of which has been paid from the net proceeds of the Tremain Mill. I have paid for over 1800 feet of development work with this Mill since I erected it two years ago last October. My experience teaches me that if anyone has any trouble with the Tremain Mill it is the fault of the man who operates it.



Yours very truly,

WHITING G. PRESS.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These machines save the gold WITHOUT THE USE OF WATER, enabling the miner to thoroughly prospect on the spot and successfully work the rich benches and gulches, when water is not convenient. The separation is accomplished by graduated air current. These machines are especially adapted for saving flour and beach gold. No quicksilver being used, the iron-coated beach gold of Cape Nome, so difficult to amalgamate, is saved with these machines as easily as though the gold was clean. Send for descriptive circulars.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.
55-57 Market St., Chicago. 120 Pearl St., Boston.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

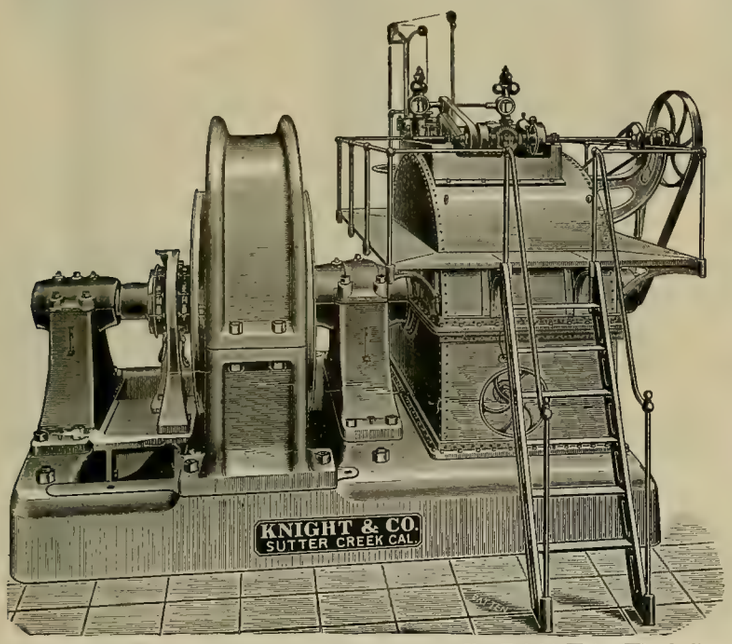
—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.



We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

(SEE PAGE 477.)

KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of **The Knight Water Wheel**, direct-coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing.

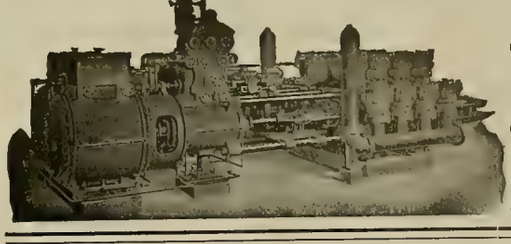
—— THE ——

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,
Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.



Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of April, 1900, an assessment (No 23) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of May, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 28th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of April, 1900, an assessment (No. 70) of fifteen (15c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 31st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of April, 1900, an assessment (No. 16) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of June, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of April, 1900, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of June, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 25th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

No. 2076.—VOLUME LXXX. Number 18. SAN FRANCISCO, SATURDAY, MAY 5, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A 150 H. P. Gasoline Engine.

This illustration shows the latest and largest type of gasoline and distillate engine produced by the Union Gas Engine Co. of San Francisco. This is a horizontal duplex engine of 150 H. P., with one flywheel and out-board bearing, self-starter and all the latest improvements of Union engines. Each cylinder is virtually a separate engine, as each has its own governor, gas generator and working parts, so that each can be worked separately. When running full there is an impulse, or working stroke, for each revolution, thus insuring steadiness and close regulation of speed. The engine is started with the Union self-starting device, which the manufacturers say makes it as easy to start as a steam engine. It is so constructed that all residue of burnt gases is removed from the cylinder before the next charge of gas and air is introduced. This is a new and valuable feature in the Union engines and adds to the economy of running. The Union Gas Engine Co. have moved to their new works, 244 First street, San Francisco, where they are building all sizes from 3 H. P. to 150 H. P., and are designing engines of 250 H. P. and 500 H. P.

150 H. P. Gasoline Engine.

THE dreadful explosion in the Scofield, Utah, coal mines, an account of which appears on page 496, is unparalleled in its deplorable fatality. It is thought that when the sad work of carrying out the dead is completed, it will be found that nearly 250 coal miners lost their lives. The cause of the disaster is unexplained. All colleries are subject to such explosions, even those in which care and constant effort contribute to keep comparatively safe. The best that can be done is to reduce the number of such disasters to a minimum. The Pleasant Valley colleries at Scofield, Utah, were generally reported to be free from fire damp; but, if it is true, as stated in the report, that mine No. 4 was used as a giant powder magazine, it will not be hard for the investigating committee to find out the cause of the accident, if "accident" it can be called, where the combination of carelessness, coal dust, gas and access to giant powder would form so formidable and certain a combination. This paper has repeatedly pointed out the criminal folly of underground storage of giant powder, and that such careless practice was allowed in this case seems almost impossible to believe.

IN the issue of the 14th ult. was noted the sale of the Stanley mine, Idaho Springs, Clear Creek Co., Colo., to Montreal residents. Much was locally published regarding the value of the property and the mutual advantage of the transfer. It now transpires that alleged sharp practice and duplicity interfere with the transfer. The facts, as locally set forth, are represented to be to the effect that C. A. Gehrmann of Idaho Springs owned one-quarter interest in the property and vigorously developed it for the company, making "a good mine" of it. He then succeeded in selling the property to three persons in a private deal, the buyers depositing $25,000, Gehrmann having the power of attorney to make the sale. The new owners then sold the mine to the Montreal people for $850,000, and 20% royalty on all ore subsequently extracted therefrom. The Montreal men paid $250,000. They claim they paid this money to Gehrmann and that he agreed to deliver the mine to them when the board of directors ratified the sale. At a meeting of the directors for that purpose Gehrmann offered them $375,000. The company directors refused to take less than $850,000 minus his commission of $100,000 for making the sale and his one-quarter interest. The Montreal people want to take the mine according to contract; the Colorado company, including Gehrmann, want to have them take it; Gehrmann is unable to deliver it but declines to proffer his company more than the $375,000, which they decline to accept, thus making a deadlock. As at present the Montreal men have parted with $250,000, without immediate prospect of possession of the mine for which they partly paid, and the Colorado parties seem to be getting ready for tedious litigation. These things always have a bad effect on mining sales, and in such effect the matter becomes a public concern instead of a private squabble over division of the proceeds.

Mineral Land Classification.

In Chaffee Co., Colorado, in Idaho, Montana, parts of California and the State of Washington has arisen this year renewal of conflict as to legality of claims of lands, "chiefly valuable for stone," as in distinction to other classification of lands. The last word has not yet been spoken thereon, but the most recent decision in the matter—that by Judge Hanford in the U. S. Circuit Court, Washington district—tends to clarify the question.

The case was The Northern Pacific Ry. Co. vs. J. A. Soderberg. When the suit began Soderberg was in possession of the land in dispute and was quarrying and selling granite therefrom. He claimed title and right to remove stone because of proceedings begun by him to acquire U. S. title for the land as a placer mining claim pursuant to the Act of Congress of date Aug. 4, 1892, entitled "An Act to authorize the entry of lands chiefly valuable for building stone under the placer mining laws."

There was no controversy between the Railway Co. and Soderberg as to the facts; the suit was solely to determine the question whether granite was "a mineral" within the definition of that word as it is used in the Act of Congress granting lands to the N. P. R. R. Soderberg had perfected his title to the land, and, after contest, the Land Department had issued a patent to him. In another case in which the same question was raised, the court referred to, at a term held in Spokane, decided the question the other way, in favor of the railroad, the court then believing that its decision was in harmony with the rule prevailing at that time in the Land Department.

In this last litigation—that in which Soderberg was defendant—the matter was considered a test case; counsel on both sides went into the question at great length, and the court gives a long opinion, deciding for defendant and against the Railway Co. The gist of Judge Hanford's opinion is that it is not to be understood that Congress, in the use of the word "mineral," intended it to have a limited definition and to include only metalliferous minerals. In its common and ordinary signification the word "mineral" is not a synonym for "metal," but is a comprehensive term, including every description of stone and rock deposits, whether containing metallic substances or entirely non-metallic. Congress having chosen a word of such broad significance to define the class of lands reserved from railway grants, the courts and the Land Department have no authority in construing the Act to give a narrow or limited definition to the word in order to enhance the value of the railway grant, and to thus diminish the rights of the public in the lands reserved. Thus, as the granting Act does not indicate an intention on the part of Congress to restrict the meaning of the word "mineral," and in subsequent statutes stone lands are classed as mineral lands, the court, therefore, decreed for defendant, Soderberg.

It is to be further noted that in the Idaho-Montana mineral land bill, and in the California mineral land bill now before Congress, but to be probably superseded by Commissioner Hermann's mistaken measure, the statute does not direct that only lands valuable for the metalliferous minerals therein should be classed as mineral lands, but gives the same meaning to the word "mineral" as that in the Act of Aug. 4, 1892, viz., all minerals, whether containing metal or not, except iron or coal.

In view of the magnitude of the interests involved, and its particular importance to Western miners, the decision, including the point upon which it is based, is worthy of editorial notice.

TO THOSE familiar with former Comstock milling methods more than ordinary interest attaches to the proposition that future treatment of high-grade Comstock ore shall be at the Selby Smelting & Lead Co.'s works near Vallejo, Cal., the purchase price to be based on the average railroad car sample assay value of the ore upon arrival at Vallejo, paying a minimum of $19 per ounce for the gold and 95% of the current New York price for the silver. A 300-ton lot is to be given a test from the Con. Cal. & Va. If mutually satisfactory, the idea is to send monthly about 500 tons ore averaging above $25 per ton, ore below that value to be worked at the Kinkead mill at Virginia City, Nev. Past and present conditions as to Comstock costs afford interesting comparison. In 1868 the cost of running 938 feet of tunnel on the 400 level of the Gould & Curry was $16.84 per foot, and of 1465 feet on the 200-foot level $16.08 per foot. In the same mine that year the average cost of extracting ore was $8.82 per ton; in the Hale & Norcross, $9.08. The cost of milling Gould & Curry ore that year was $13.30 per ton; of Savage ore, $14.04; of Hale & Norcross, $14.26. The cost of sinking 692½ feet of the Bonner shaft in the Gould & Curry was $75,738.40.

Taxing Unpatented Mining Claims.

A. S. Bosquit, as Tax Collector of El Dorado county, sold a mining claim, lot 45, section 34, township 13, last Saturday, property that had been sold to the State for delinquent taxes and never redeemed. This was the first sale of the kind in the county under the new law. P. B. Hogan was the purchaser, and the price paid was $265.—Mountain Democrat, Placerville, Cal., April 28.

The above-mentioned property was advertised in the Gazette previous to the sale. As the total amount for delinquent taxes, advertising notice of sale, etc., only amounted to $52.91, the State made $212.09 by the transaction.—Gazette, Georgetown, Cal., April 30.

But did it? Does "the State" "make" anything by such transaction? This whole matter of assessing unpatented mining claims, afterward "sold to the State for delinquent taxes," and subsequently bid in at public vendue is a farce. That it is "the law" makes no difference. It is a silly statute, and if ever seriously contested will be beaten.

The whole anomalous system is one more addition to the load carried by the miner, one more deterrent influence against investment. In years past the State was the purchaser at such delinquent tax sales and held the certificate, no buyer desiring such unsubstantial title. Since the passage of the new law such deed must be recorded, but can only serve as a continual cloud to title. There is no procedure provided for examination and cancellation of invalid certificates, and the statute asserts absolute title, and right of possession of unpatented lands, and makes the deed per se conclusive as to the regularity of all proceedings and sale. The vagueness of descriptions in these certificates at times creates additional confusion, making menace to titles to valuable property, in no way affected or connected with the delinquent property.

Some county tax collector could refuse to make the deeds to the State until mandamused by the court. A test case should be made. It is hard enough now to sell a mining property without adding uncertainty of title.

Apart from all this is, however, the plain proposition—the law in the case—that, until patented, the title rests in the general Government, and the State can not make good its claim, or hold the land as subject to taxation. Of course, may come the legal quibble that the State does not tax the claim itself, but only the locator's possessory right therein, and this possessory right thus defined is "real estate," but when the tax deed is made out, it is not the owner's possessory interest that is mentioned, but the claim itself. The State can not go to mining, and can only technically deprive the prospector of his claim, without gaining anything. It is inferred in one of the extracts above that "the State made $212.09 by the transaction." A fine business, indeed, for the commonwealth of California to be engaged in!

In assessing unpatented mining claims, the assessor simply copies from the county records a list of locations and arbitrarily values them; he never looks for them; probably couldn't find half of them if he did. The State can not do the assessment work needed to hold the claim that it tries to take away from the prospector, and usually its title is extinct long before it issues its deed. All the prospector can do is to take time for his ally, and when the ground is open to legal relocation, locate it again. Then the State can assess him again, and, when delinquent, can sell him out again, and so on—a good way how not to develop a country. If the State needs money, let it charge a license. The present plan does not rise to the dignity of meriting contempt. It is an anachronism, a mess of muddling methods, mulcting miners, and of injury to the State.

Concentrates.

A QUICKSILVER MINE with 1% ore is susceptible of very profitable operation.

THE U. S. Circuit Court of Appeals has recently decided that imported zinc dust does not have to pay duty.

AN arrastra can be made or bought. It is essentially a fine grinding machine, and ore exceeding ¼ inch should not be fed to it.

THE company specially mentioned by L. V. T., Leadville, Colo., seems to be organized on the pliant plan to "always sell out at the right time."

THE fact that the terms of a sale as made by an agent varied from the terms of his authority is immaterial, where the principal ratified the sale as made.

IT is only the individual share of a partner, after all the affairs of the firm have been fully settled, that can be taken and applied in the payment of his individual debt.

THE first number of the MINING AND SCIENTIFIC PRESS appeared May 24, 1860. The first number of the Engineering and Mining Journal, of New York City, March 31, 1866.

A CONGRESS OF MINING AND METALLURGY will be held in Paris from June 18th to 23rd. Particulars may be had from the secretary, Mons. Gruner, 55 rue de Chateaudon, Paris.

THE fact that the parties to an oral agreement expected that a written contract, embodying the same terms, would afterwards be signed, does not prevent the oral contract from taking effect.

CAST COPPER is as susceptible of high electric conductivity as any other, if oxide of copper be absent. If cast direct from the refinery furnace, with few cold sets, it should ordinarily give satisfaction.

A FLAT ROPE will last as long as a round rope for mine hoisting, the difference being in the cost of repairs, a flat rope having to be resewed about every six months, while a round rope often goes two years without any repairs.

MINING and electrical engineering offer profitable field for action to the trained technical worker, who, if he has the requisite knowledge, the ability to specialize, and the energy to use opportunity, should find fitting place at the front.

AT the equator a degree of longitude equals 69.16 miles; at 30° latitude a degree of longitude equals 59.94 miles; at 50° latitude a degree of longitude equals 44.54 miles; at 70° latitude a degree of longitude equals 23.72 miles.

WHERE a debtor tells a person in whose hands an account has been placed for collection, without objecting to the same, that he will pay it, it is a stating of account between the parties, and the amount bears interest from that date.

MASS means the quantity of matter in a body; energy, the amount of power stored in a body; velocity, the rate at which motion proceeds; kinetic force, the amount of force that a moving body can exert in overcoming a resistance.

SECRETARY OF THE INTERIOR BLISS has decided that the law to the effect that all mineral applications must be published in the paper nearest the claim means just what it says, and that any other publication of application for patent is not legal.

IN California, mining company directors can conduct the ordinary business of the company; but when it comes to selling, leasing, mortgaging or otherwise disposing of any part of the mining ground of the company, or obtaining, except by location, any additional mining ground, such acts are illegal unless ratified by a majority of the stockholders.

IN charging a storage battery one loses about 20% of the energy supplied to it; in operating a motor with this current there is lost 10% of what remains; in converting the mechanical energy of the motor into electricity for charging the battery again would be lost another 10% of the energy. In general, losses of electrical power may be assumed at 7% in the generators, 10% in the line and 7% in the motors.

A PLACER CLAIM cannot cross lode claims and exclude the conflicting areas, for it is only the surface ground which the claimant applies for; so, unless the placer claim covers disputed territory which the claimant does not intend to exclude, which territory had been surveyed for patent previous to the placer survey, there can be no conflict with other claims. In the case of placer surveys a descriptive report must be attached.

DIMENSIONS of a good assay furnace may be: firebox, 16 inches long by 14 inches wide; height of lower muffle above grate bars, 14 inches; width of firebox at bottom of the 9x15-inch muffle, 12 inches; width between muffles of furnace walls, 8 inches; upper muffle, 5½ inches above lower muffle; above upper muffle opening to chimney, 4x16 inches; one foot above muffle chimney, 9x9 inches; space between rear end of muffles and furnace walks, 2 inches.

FOR a copper test, saturate a bead of salt of phosphorus—microcosmic salt—to opalescence with magnesia. This bead when flamed will become white. The slightest trace of copper will show in the cold bead a rich rose-red coloring, if the bead is held in the fusing zone. The strongest possible blowpipe flame must be used. The bead in an oxidizing flame, or when hot, is colorless. Metallic copper or the most complex ore can be used. One two hundred and fifty thousandth of a grain of copper will make a showing.

THE survey of a millsite for patent and the notes thereof are similar to those of a lode claim. The ties are made from the various corners. From corner 1 to a corner of the public survey, and from the other corners, ties are made to adjacent claims if there are any. The description starts with corner 1 and continues around the boundary lines of the site. There can be no intersections with other claims, for the reason that a millsite can only be located upon what is considered to be non-mineral land.

WHAT is known as the "life" of a boiler generally depends upon the amount of corrosion to which it is subjected. With good feed water, which will neither corrode the metal nor cause the deposit of a dangerous scale, and with care to keep the outside surface perfectly dry, a life of forty years for a plain cylinder is not uncommon. With slow corrosion its life may be reduced to five years or less, with the additional inconvenience that the pressure of steam which may be safely carried is continually being reduced during its life.

ONE way of refining impure amalgam, which brings amalgam 400 and 600 fine up to 800, is by passing a strong blast of air through the impure amalgam, the scum of oxydized copper and iron which gradually forms on the surface being taken up by a weak solution of sulphuric acid to which common salt is added from time to time. The process is quickened if a weak electric current, enough to overcome the resistance of the liquid on the mercury, is used. The impurities in the amalgam immediately gather around the anodes, and gradually pass into solution. If the current and acid solutions used are very weak, there is no danger of attacking the mercury, and the refining is very quick.

A FLEXIBLE METAL hose is made at Pforzheim, Germany, by rolling up a metal band like a screw thread, the specially profiled edges engaging in one another so as to form a continuous joint, which is made tight by a cord of rubber or asbestos. The metals chiefly used are galvanized steel and phosphor-bronze. The pipe is remarkably flexible, and its one disadvantage of tending to untwist through rough usage is overcome by making it double, with opposite windings. It is intended for mining purposes instead of rubber hose. It is made up to 8 inches in diameter, and to withstand pressure up to 200 atmospheres. A flexible metallic tubing of value for mining and mechanical purposes was described and illustrated in the issue of Feb. 3, 1900.

THE induction coil which usually accompanies medical batteries is made by winding on a bundle of iron wires a comparatively short length of heavy wire, which is called the primary coil, and over this a coil of many turns of fine wire called the secondary coil. Before putting the wire on, the iron core must be very carefully insulated with paper dipped in paraffine or shellac. When this is dry or hard, wind one or two layers of, say; No. 16 cotton insulated wire. Insulate this carefully as before and then wind over it four or five or more layers of No. 30 to 32 insulated wire, carefully insulating each layer from its neighbor. The value of the coil will depend very largely upon one's skill in winding and the care with which the insulation is effected.

DURING the period of sixty days of advertising the application for patent which follows the approval of the survey of a mining claim, any one believing that he has a better title to the ground than the applicant may bring an adverse suit against the claimant by filing adverse papers in the U. S. Land Office for the district in which the survey is located. One of the essential things in such a suit is an adverse plat, which must be made by a U. S. deputy mineral surveyor. It must be made from an actual survey on the ground, and so certified to by him. The survey must describe the conflict said to exist, and must be a description by metes and bounds, and the area of the conflict must be stated. The calculations are made in exactly the same way as if for patent.

A SPECIMEN ASSAY is made to determine whether a piece of rock, mineral, or other material contains gold, silver, etc. No sale of ore is made on the assay, and it is therefore unnecessary to make a number of check assays. Control assays are made on samples prepared from and representing a lot of ore which is for sale, and are usually either checks on the assay made by the assayers of sampling works, smelters or mills. Four checks are always run, and if the sample is not perfectly homogeneous, often many more; also, as not infrequently happens, if a repeat is required, because assays do not agree, no extra charge is made. Umpires are assays made to settle differences between other assayers. These call for all the skill and ability of an assayer, as often thousands of dollars depend on the result. Often eight to ten checks must be made, as the trouble is frequently due to coarse gold or non-homogeneity of samples.

TROUBLES common to steam boilers are: 1. Tendency to accumulation of scale or mud on the plates over or near to the fire, causing "bagging" of plates, leakage of seams, and sometimes explosions. 2. Overheating of seams where they overlap, the metal at these points being of double thickness, especially when the seams are covered with scale. 3. External corrosion, commonly caused by dampness or rain water percolating through a deposit of dust and soot, which is apt to contain sulphur combinations formed from the gases of burning coal. Such corrosion is especially apt to take place when the boiler is cold. 4. Internal corrosion, generally due to feed water containing acid; but sometimes corrosion seems to be caused by very pure water containing dissolved oxygen, such as rain water. In mining regions corrosion is probably the greatest danger to which boilers are exposed, next to negligence of attendants, and great care should always be exercised in frequent inspections, to learn whether or not corrosion is taking place. Whenever it is found, steps should be at once taken, by treatment of the feed water or otherwise, to remove its cause.

TO OBTAIN a commission of U. S. deputy mineral surveyor, the applicant is required to pass an examination before the surveyor general's office. This consists of the figuring out of intersections between conflicting claims, the ties and boundary lines of the claims being given by courses and distances, the calculation of the areas in conflict, and the solving of various trigonometrical problems. The applicant is also examined at considerable length on the rules to deputies, and is required to write out a set of notes from data furnished him. If he passes this office examination satisfactorily he is examined in the field on deflecting lines from the true north and south meridian. These lines he runs with his own transit. This ends his examination. He must also show that he has been in some surveyor's office for six months prior to his examination and must file bonds for $10,000. If everything has been satisfactory his commission issues.

TO DETERMINE the amount of lead in lead ore, one way is to weigh one gram of the ore if rich, more if poor, into a platinum dish, cover with a watch glass and add 40 to 50 c.c. of a mixture of one part sulphuric acid (1.84 sp. gr.) and three parts nitric acid (1.42 sp. gr.) Heat the covered dish on a hot plate, water bath or sand bath until the action of the acids on the ore has apparently ceased. Then remove the watch glass and rinse into the dish. Add 10 to 15 c.c. hydrofluoric acid to the solution and evaporate until dense white fumes of sulphuric acid begin to come off. It is better to conduct the evaporation under a hood for various reasons. Remove the dish from the source of heat and cool. Dilute to about 100 c. c. with water, digest till all soluble salts are in solution and filter, washing first with a 2% solution of sulphuric acid and then with alcohol. Dry, burn filter paper, and ignite precipitate separately. Weigh as lead sulphate and calculate per cent of lead present in the ore.

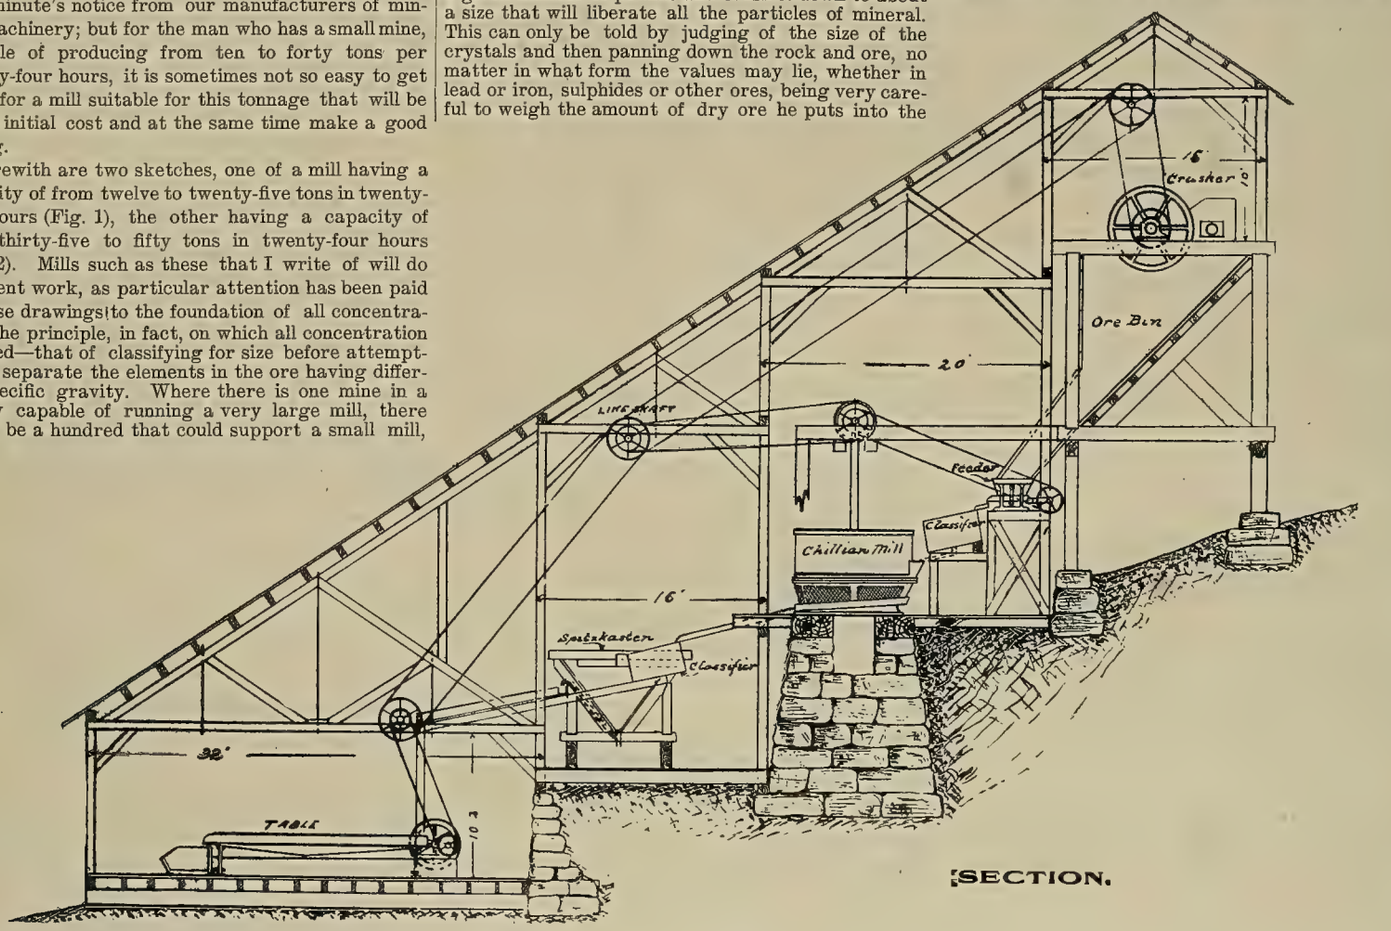
THE alleged existence of gold in old mining timbers has been investigated in California and Colorado with negative results. According to O'Driscoll in his "Notes on the Treatment of Gold Ore," he says that in experiments by J. C. Newbery, Chief of the Technological Museum, Melbourne, Australia, he examined mine timbers which had long been saturated by mine waters, expecting to find in the fibers of the timber gold which had been precipitated from solutions. "Some large logs of undressed close-grained eucalyptus timber, which had been in mine waters between twelve and fourteen years, were experimented upon; the outsides of these were cut away and perfectly sound pieces were obtained. These were dressed quite smooth, and to all appearances were as ordinary pieces of planed timber. They were then carefully calcined and the ash examined, a considerable quantity of highly minute gold and silica being found. Microscopical examination of these showed that both gold and silica were in irregular particles, quite unlike the forms they would have assumed had they been there precipitated from solutions; the capillary attraction of the wood had drawn them amongst the fibers together with the water." This whole matter was given scientific analytical discussion in the issue of Dec. 11, '97.

RETORTING AMALGAM depends upon the fact that, if amalgam is heated slightly above the temperature at which mercury boils, the mercury will be volatilized and distill over, leaving the spongy gold behind. A retort usually used in small mills is of cast iron, the cover and retort turned and ground to fit each other perfectly. The bale is of wrought iron, and takes hold under the flange on the retort, then the wedge is driven in between the cover and bale, making a secure joint. The pipe condenser is placed so that its lower end is immersed in water while the retort rests in the fire. It is made in various sizes—from 3⅞ inches inside diameter at the top by 3¼ inches inside diameter at the bottom and 4½ inches depth to 12 by 10 by 17½ inches. This size retort requires no special setting, but may be heated in the blacksmith's forge or in a crucible assay furnace. The inside of the retort is covered with chalk or paper to prevent the bullion adhering to the iron. The balls of amalgam are placed in the retort and packed down with a bolt head. The retort should not be filled more than two-thirds. The cover is clamped on and the retort is heated gradually at first. Shortly after it has attained the temperature at which mercury boils, the mercury commences to distill over and is condensed, falling into the water. The heat is kept stationary until nearly all the mercury has distilled off, when it is gradually raised to bright redness to expel the remainder of the mercury. After cooling, it is opened and the retorted bullion is removed. If the retorting has been properly conducted, the bullion should not contain over one part of mercury in 1000, while if heated to too high a temperature at the commencement, or not sufficiently high at the end of the operation, it may retain a considerable amount. The retorted bullion should be remelted and cast into an ingot before it is sold. This is not universally done, but is the best practice, as it is impossible to obtain a true average sample from a retort.

Small Mine Concentration.

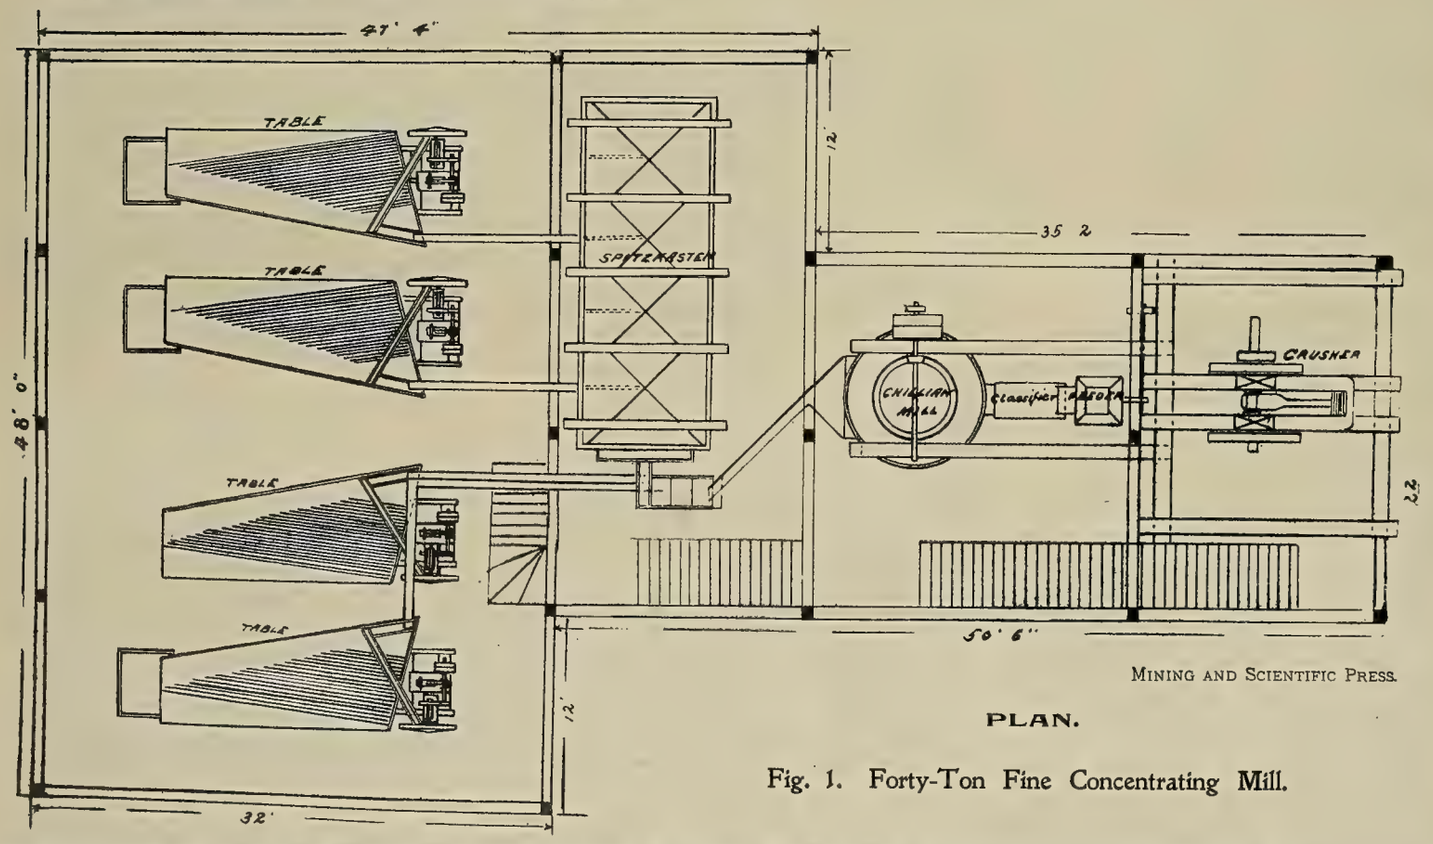
Written for the MINING AND SCIENTIFIC PRESS by S. I. HALLETT, Aspen, Colo.

It is very easy for a company having a large mine to get plans for a 100-ton or a 500-ton concentrator at a minute's notice from our manufacturers of mining machinery; but for the man who has a small mine, capable of producing from ten to forty tons per twenty-four hours, it is sometimes not so easy to get plans for a mill suitable for this tonnage that will be low in initial cost and at the same time make a good saving.



Herewith are two sketches, one of a mill having a capacity of from twelve to twenty-five tons in twenty-four hours (Fig. 1), the other having a capacity of from thirty-five to fifty tons in twenty-four hours (Fig. 2). Mills such as these that I write of will do excellent work, as particular attention has been paid in these drawings to the foundation of all concentration, the principle, in fact, on which all concentration is based—that of classifying for size before attempting to separate the elements in the ore having different specific gravity. Where there is one mine in a county capable of running a very large mill, there should be a hundred that could support a small mill, keep the mill going and make the owners money. When a man finds a lead in the mountains that looks as though it might carry a considerable amount of ore and of a paying value, he should first thoroughly satisfy himself as to how his values lie; whether the values are generally disseminated throughout the vein, or whether they lie in a pay streak; and do development work enough to get an idea of what his daily output can be, and still keep up development work. He will have assays made and, naturally, if his ore is of a high enough grade, will ship it to market without attempting to treat it on the ground. He will then almost daily pan his rock, if it carries gold values, to see whether the ore is free milling or not; but, even if free milling, he will undoubtedly have to catch the sulphides behind the plates.

In order to test for concentration, he should take a given number of pounds and crush it down to about a size that will liberate all the particles of mineral. This can only be told by judging of the size of the crystals and then panning down the rock and ore, no matter in what form the values may lie, whether in lead or iron, sulphides or other ores, being very careful to weigh the amount of dry ore he puts into the gold pan, and also in catching the dirty slimes that he pans off, drying them down by evaporation and assaying them; then taking his coarse tailings separately, drying, assaying and weighing them, and, finally, taking the more valuable heavy material left as concentrates in the gold pan and weighing these and assaying them as well. This will give him a very good idea as to whether his ore will concentrate or not.



For the very first step in concentration it is necessary that he should have a concentrating ore, one in which the values lie with the heavier lesser portion of the ore. Having determined to his satisfaction that the ore will concentrate and that it is advisable to concentrate it, his next question is the size of a mill. Many men can afford to put up a small mill, or, failing in that and having a good small property, can get others to put up the mill for an interest.

There is no necessity for a man to be scared at the idea of building a concentrator. It does not require a fortune, and a small mine that can be worked at a profit with a small mill would usually be a failure with a large mill, because, in endeavoring to get the heavier tonnage, he would mine stuff that would not pay, whereas with the smaller mill he would only take that material that would return him a profit.

In making up these plans I have endeavored to sacrifice everything to initial cost, getting only those

PLAN.

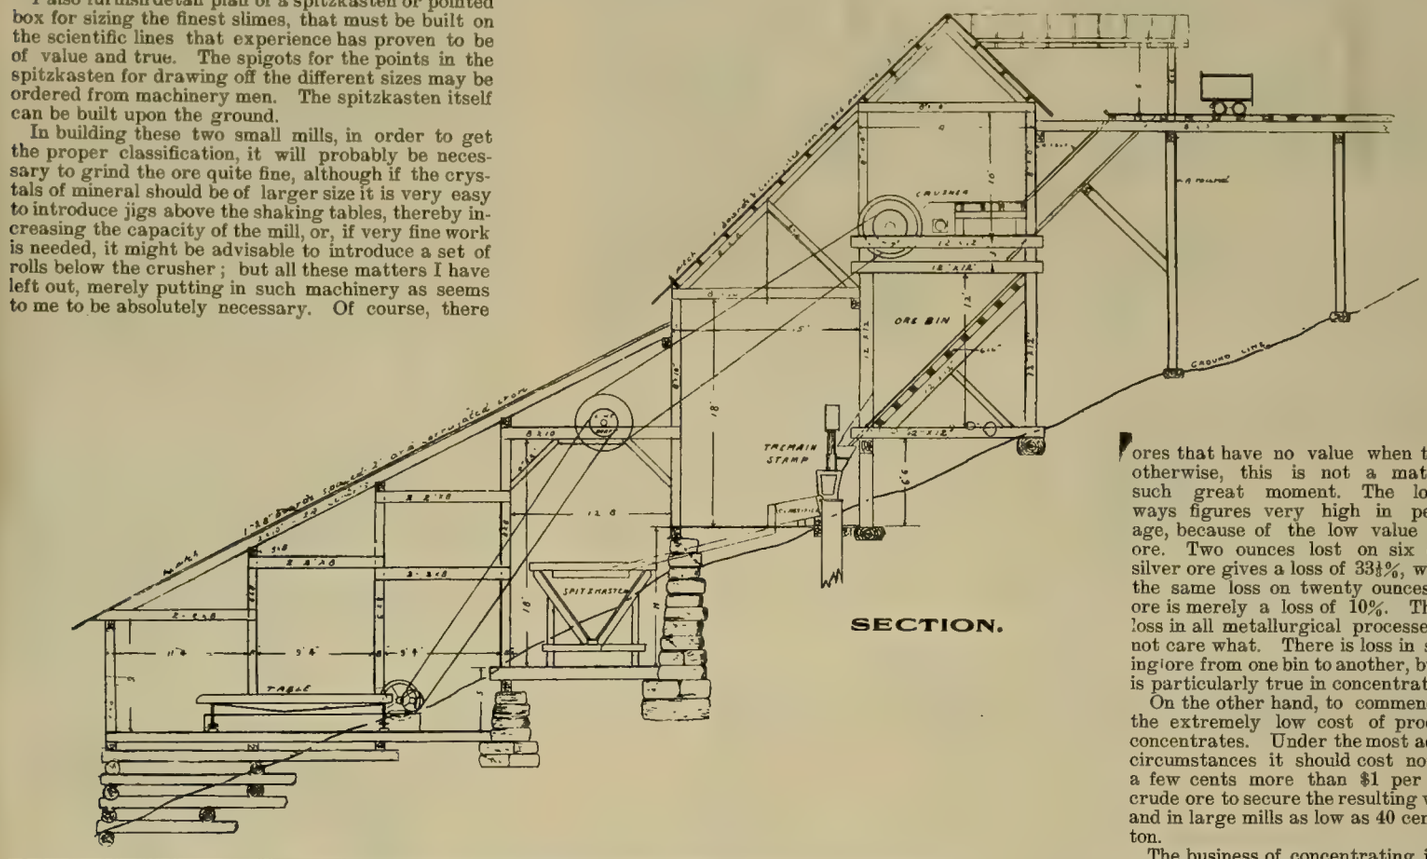

Fig. 1. Forty-Ton Fine Concentrating Mill.

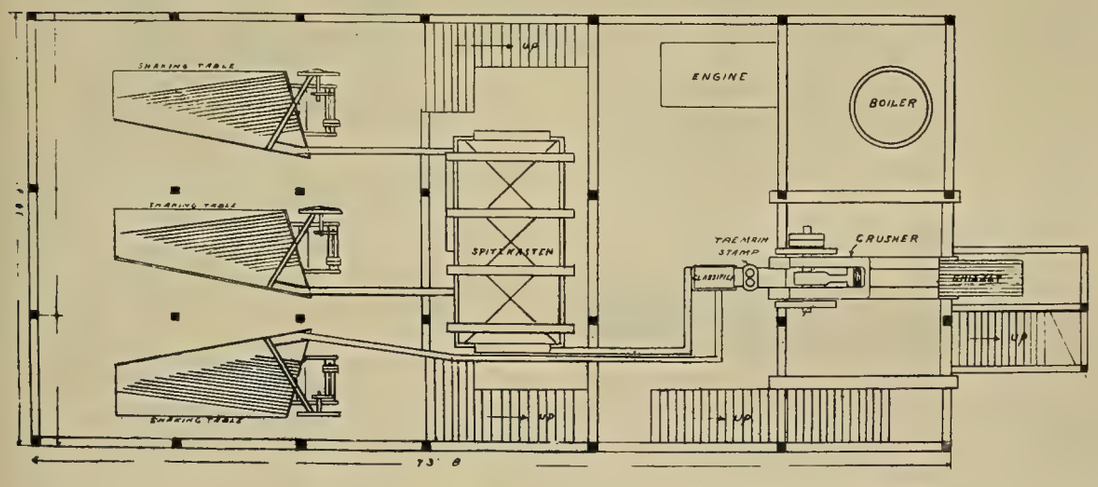
pieces of machinery that are necessary to crush the ore and separate it, and with just as little concentrating machinery as will do the work. It is very easy to build an elaborate machine, but very hard to build a simple one.



I am indebted to Herbert A. Wilcox, who has done the designing of the above Figs. 1 and 2, and to David Cole, both of Aspen, Colo., who has given me the design of a classifier to be used that is an adaptation of classifiers used elsewhere. This sketch of a classifier, that can be made by any carpenter, was sketched by Mr. Cole. It is suitable for a small amount of feed and does very excellent work when the tonnage is not too heavy. As it is very simple and can be made on the ground, I thought it might be of value.

I also furnish detail plan of a spitzkasten or pointed box for sizing the finest slimes, that must be built on the scientific lines that experience has proven to be of value and true. The spigots for the points in the spitzkasten for drawing off the different sizes may be ordered from machinery men. The spitzkasten itself can be built upon the ground.

In building these two small mills, in order to get the proper classification, it will probably be necessary to grind the ore quite fine, although if the crystals of mineral should be of larger size it is very easy to introduce jigs above the shaking tables, thereby increasing the capacity of the mill, or, if very fine work is needed, it might be advisable to introduce a set of rolls below the crusher; but all these matters I have left out, merely putting in such machinery as seems to me to be absolutely necessary. Of course, there

SECTION.

PLAN.

MINING AND SCIENTIFIC PRESS.

Fig. 2. Twenty-Ton Fine Concentrating Mill.

will be local changes, according to the ore, that must be figured on.

Very often it adds to the capacity of one of these mills to put a two-compartment jig before the final finishing grinder or stamps, using it merely for the purpose of discharging waste, and not attempting to make a clean concentrate with the jig, but feeding the final crushing machinery by means of spouts on the jigs, as all of the tailings that are discharged by these jigs, if there are any, do not have to be crushed fine.

The plans given above are rough mills, perhaps not suitable to all kinds of ore, but certainly give a foundation upon which to work. The crusher should be a fine-grinding one, grinding down from the original ore to certainly not more than half an inch in size. Such crushers can be found. For a hard ore, not having much clay, I would suggest the Gates crusher. For an ore having a soft material that is liable to pack, I would suggest one of the rotary jaw-crushers, the main idea being to crush from mine size down to the finest possible point with the one machine.

For a finishing machine in Fig. 1, I have put in a Tremain stamp mill, though any other form of steam stamps would undoubtedly do. I have endeavored to use all machinery that is self-contained and requires but very little foundation or buildings and that can easily be moved and transported.

The tables are of the shaking variety and are readily handled by any one of common judgment.

In Fig. 2, I have adopted the same style of crusher for these plans, but have placed a Chilian mill as a finishing machine, they having a larger capacity and also having this advantage: that it is possible to run all the machinery in this mill with a turbine or Pelton wheel where water power may be secured, whereas with Fig. 1 steam is absolutely necessary, as it is the direct motive power of the stamps. These Chilian mills are very heavy, but require few repairs, take up but little room and do not require an excessive foundation, as they are practically self-contained.

As the question of freight enters so largely into the cost of mining machinery, I will not attempt to give any prices for which these mills could be erected, but from the figures given any man manufacturing mining machinery could give a very close answer to any questions.

In traveling through the country in the mining regions one is surprised at the number of claims that have enough ore to run a small mill, either through the twenty-four hours or that could be run during the day shift, that would pay all the expenses of developing the property and still leave a profit, and as years go by such mines will be developed and worked far more than they have ever been in the past. Concentration really is coming to be part of a mining man's education, and, although it has made great strides in the past few years, like all other arts, it is still in its infancy. It has many qualities to commend it and many others to condemn. It is a wasteful process when done at its best, of necessity losing large amounts of the value of the ore in the endeavor to concentrate it; but as it is almost invariably used upon ores that have no value when treated otherwise, this is not a matter of such great moment. The loss always figures very high in percentage, because of the low value of the ore. Two ounces lost on six ounces silver ore gives a loss of 33⅓%, whereas the same loss on twenty ounces silver ore is merely a loss of 10%. There is loss in all metallurgical processes, I do not care what. There is loss in shoveling ore from one bin to another, but this is particularly true in concentration.

On the other hand, to commend it, is the extremely low cost of producing concentrates. Under the most adverse circumstances it should cost not over a few cents more than $1 per ton of crude ore to secure the resulting values, and in large mills as low as 40 cents per ton.

The business of concentrating is very fascinating, particularly as it does not require a technical education, being dependent more for success upon common sense than upon any other quality. It is all done so that the eye may follow it, and is not like chemical or smelting reduction, governed entirely by the assaying furnace and retort. Concentration is purely a question of detail. By saving a per cent or two here and there one man will save 90% of the values, while a more careless man, on the same ore and with the same machinery, will not save over 70%. It is a business in which the personal equation enters perhaps more largely than in any other branch of ore reduction. In this, as in other lines of business, the observing, careful man is the man of success.

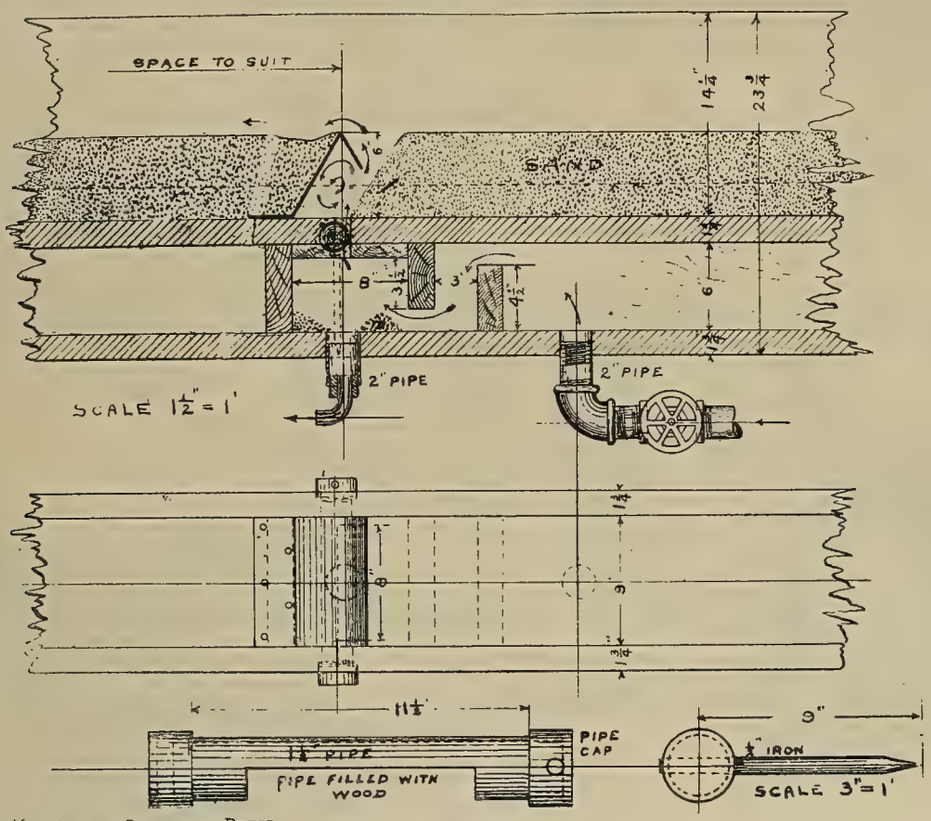
THE TWENTY-TON MILL.

The ore is trammed directly from the mine to the mill and dumped over a grizzly. The fine stuff which passes through the grizzly slides down to the reserve ore bin under the crusher. The coarse stuff which would not pass the grizzly is shoveled into a crusher, passing through which it joins the fine stuff in the reserve bin below.

From the bin it is fed by automatic feeder attached to stamp into the mortar of a Tremain stamp where it is crushed, and, on leaving mortar, goes into a Cole classifier, having one discharge and one overflow. The first product is carried by launder to No. 1 table. The overflow goes to a three-compartment spitzkasten. The product of the first compartment is fed to No. 2 table. The second and third discharge is fed upon the third table. The overflow goes to waste. The concentrates are caught in the settling boxes at the foot of the tables, as in the forty-ton mills, and handled in the same manner.

THE FORTY-TON MILL.

The ore, having been delivered at the crusher floor of mill, is fed into crusher by hand shoveling. Passing through the crusher, it falls into the reserve ore



bin, located under the crusher. From this bin it is drawn off at will by means of a chute and automatic feeder, which delivers it into a Cole classifier. This classifier makes two products: The coarser material taken out by the classifier runs into a 5-foot Chilian mill, while the overflow is carried by a launder, not shown in drawing, directly to the spitzkasten. In the Chilian mill the material is further ground to pass a screen, when it passes on to the second classifier. This classifier is similar to the first in construction, but makes two products besides the overflow. No. 1 discharge is fed to No. 1 table, No. 2 discharge to No. 2 table and the overflow goes to the spitzkasten.

The spitzkasten has four draw-off pipes. The greater part of the material will settle in the first compartment and should be fed by itself to the third table. The product of the next three compartments may be fed together upon the fourth table. The overflow of the spitzkasten goes out the waste flume.

The concentrates made on the tables are caught in settling boxes at the lower ends of the tables, from which they may be shoveled out as often as necessary. Should a dryer be required, the same can be conveniently located in a shed, which could be readily added to the lower end of the mill without any alteration of this plan.

This mill would ordinarily require 25 H. P. to run it, depending upon character of ore and fineness of crushing, but it would be better to provide power considerably in excess of this. If steam power is used, put in a 40 H. P. engine and a 75 H. P. boiler, or larger, if steam is to be used for heating and drying purposes. Power plant may be located in a separate building or in a wing of the mill, the position of which would be governed by local conditions, but should be as completely shut off from the crushing department as possible, to avoid the deleterious effects of the dust.

Don't Block the Way.

Mining is a legitimate industry, whose advance may not be for long kept in abeyance. But it frequently happens, and especially in the older camps, that a serious blocking comes in, and by the very men it most damages. Because a man has grown up with the camp is no reason for him to demand a "rake-off" from every sale or bond. Numerous sales have been stopped because of this, with the result that good prospects stand a good chance to remain prospects for years to come, whereas had a proper spirit been displayed they would now be well on the way to mines. The camp, having a host of idle and but few working mines, gets a black eye. Investors know something is wrong, and naturally fight shy. It may be changed before a new generation gets control, but not unless some of the old-timers let alone things in which they have no possible interest. If a buyer happens along, let him and the owner alone—you will get a good "slice" from the activity that will result from a sale to people able to make mines.—Idaho Mining Journal.

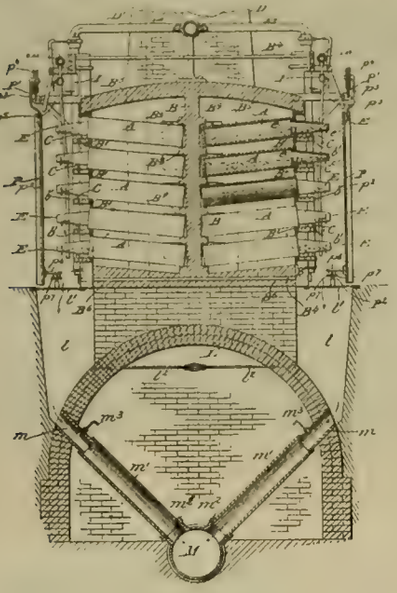
Making Lead Pipe.

Lead pipe is made by means of powerful presses, whose method of operation is extremely simple. Briefly stated, a piston working in a cylinder which has been previously filled with molten lead forces the lead through an opening, in the center of which a core is held. The core is to form the interior surface of the lead pipe, and the space between the surface of the core and the interior of the die determines the thickness of the walls of the pipe.

Adjacent to the press is a lead furnace. When the press is ready and the die and core are in place the cylinder is filled with molten lead, run from the furnace. The hydraulic machinery is set in operation, and the table bearing the lead cylinder is lifted, slowly, with tremendous power. With the cylinder, of course, rise the two bars that run up through the frame of the machine, and are joined above by the crosshead, and the crosshead carries with it the core holder; in fact, these are all immovable parts of one whole, so that, though the cylinder is in motion, the core, carried by the core holder, is always in the same position relative to the die. The cylinder is raised until the plunger or lead ram enters it and is brought into contact with the lead at some pressure. The press is then stopped a minute or two. The lead works better for the very slight cooling, and the pressure makes the mass more uniform. Then the press is set in operation again. The cooling pressure had been of about 200 tons; the working pressure in making pipe is up to 400, possibly up to 500 tons. The pressure is tremendous and continuous; if there is an opening in the cylinder anywhere the lead must go under that pressure. It cannot escape at the top, for the upper end of the lead cylinder is occupied entirely by the lead ram; but there is an opening at the bottom of the cylinder, the annular space between the core and the die, and the lead is forced out through that. It becomes perfectly fixed in shape the moment it leaves the mass of melted metal and the die. Forced through the annular opening steadily and continuously, it issues forth in the form of pipe.

When first seen coming out at the top of the press the lead pipe seems almost to shoot up, it rises so rapidly. One man operates the press; two more men handle the pipe. One of the men bends the rising pipe over so that it lies in the groove of a wooden wheel set upright over the press; after it is well started its own weight is sufficient to keep it on the wheel, and it is led thence to drums. The men who handle the hot pipe carry thick felt pads which serve as gloves, and are active while the press is in operation, for the pipes keep coming steadily.

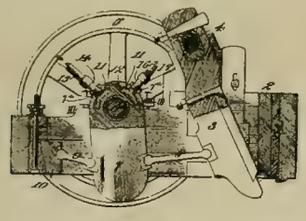
A Senatorial Definition of Shoal Water.



In a recent Senate debate, Senator Pettus impressively asked Senator Carter to explain what was meant by "shoal water," in the mining regulations of the Alaskan code. Senator Carter stated that shoal water was the water between the blue line of the sea and the shore. "It may extend 10 or 15 miles from shore, but if you can get gold 10 or 15 miles from shore so much the better for us," he added.

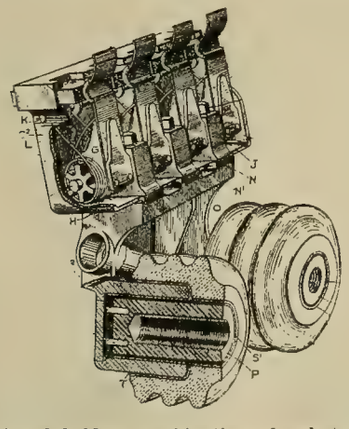
Mining and Metallurgical Patents.

Patents Issued April 24, 1900.



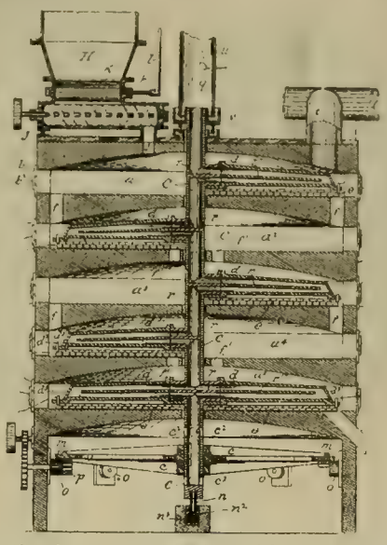
Specially Reported for the MINING AND SCIENTIFIC PRESS.

METALLURGICAL FURNACE.—No. 647,663; W. & J. Lanyon, Pittsburg, Kan.



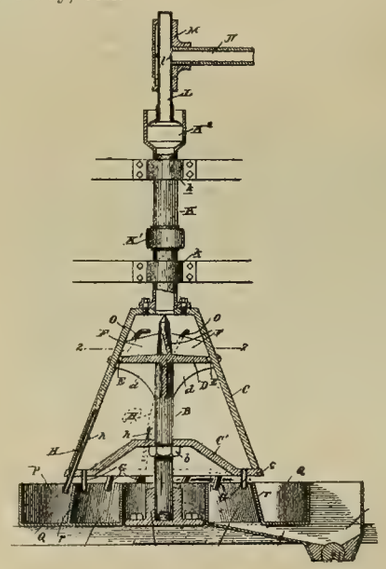
The combination, with block of furnaces, and cellar arranged longitudinally beneath and wider than block of furnaces, cellar having an arched roof onto which furnace may discharge, of plurality of branch conduits extending through and opening outside the hips of arched roof, branch cut-off being provided with removable portions, a main conduit in communication with branch conduit, screening device, and fan arranged to move material through conduits and discharge it onto the screening device.

VIBRATING PITMAN FOR CRUSHERS.—No. 648,015; G. W. Wright, Webb City, Mo.



A vibrating pitman for reciprocating the active jaw of a crusher, comprising an opening in upper end of pitman, adapted to receive the eccentric part of an eccentric shaft, semicircular water chamber, located within the upper end of pitman, extending from side to side of pitman and straddling opening and separated therefrom, inlet and outlet radial pipe sockets located at top of pitman and on opposite sides of water chamber, radial pillars extending longitudinally of crown of chamber, and inlet and outlet pipes connected with respective pipe sockets; the inlet pipe directing flow of water from above downwardly onto inner wall of chamber from whence it is spread, divided up by radial pillars and distributed over inner wall toward outlet side of chamber and passes upwardly out through outlet pipe.

BRUSH HOLDER.—No. 648,052; E. D. Priest, Schenectady, N. Y; assignor to the General Electric Company, of New York.



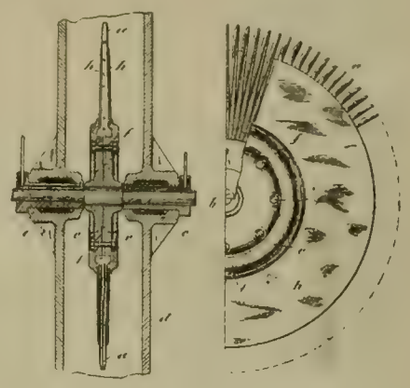
In a brush holder, combination of socket screw-threaded plug mounted therein and surrounded by sleeve of insulating material and closely fitting metal sleeve, layer of insulating material located between end plug and bottom of socket; a winding of tape around socket and plug, and an insulator which surrounds plug and socket and in direct contact with tape.

ROASTING FURNACE.—No. 648,183; U. Wedge, Bayonne, N. J.

Roasting furnace combination with roasting chamber, hollow shaft extending vertically through chamber and having air inlets at point below chamber, hollow branch from shaft in chamber, partition across shaft and through branch, hollow arm secured to branch, and having partition corresponding with that of shaft and extending nearly its entire length, series of detachable stirring blades secured to arm, means for rotating shaft, maintaining circulation of air through shaft and arms.

CENTRIFUGAL CONCENTRATOR.—No. 648,088; P. H. Shue, Ouray, Colo.

A centrifugal ore separator, combination with substantially conical-shaped casing having series of discharge openings in bottom and series of upwardly extending elongated collecting and discharge openings in its side leading through side wall of casing, of means for creating gyratory motion of material in casing, water supplies entering the collecting and discharge openings in line with the elongated discharges, and feed entering top of casing.



PROCESS OF PRODUCING COPPER ALLOYS.—No. 647,726; G. Palis, Elberfeld, Germany.

Process for producing copper alloys free from gas oxides and other undesirable substances, consisting in following steps: First, melting copper, iron and manganese together; second, adding deoxidizing material thereto; third, adding zinc after deoxidizing material has been absorbed and continuing melting until zinc is volatilized; and, finally, agitating the molten mixture until the gases and oxides have been given off.

PROCESS OF OBTAINING PERMANENT DEPOSITS OF METALS ON ALUMINUM.—No. 647,858; E. Mies, Budesheim, Germany.

A process of depositing metals on aluminum, which consists in boiling the aluminum in solution of mixture of phosphate of metal, free acid and compound capable of attacking aluminum in presence of acid, then washing aluminum and effecting the deposition electrolytically in solution of salt of metal to be deposited.

TURBINE WHEEL.—No. 648,158; H. Zoelly, Zurich, Switzerland.

Combination in turbine wheel of radial buckets separated from each other for portion of their length, each bucket having its receiving face channeled for greater portion of its length, and pair of flat disks inclosing buckets from their inner ends for greater portion of length of channeled part of buckets, they having channels increasing in size from inner end outwardly to within short distance of their extremities, and then decreasing in size to the extremity.

PROCESS OF EXTRACTING ZINC FROM SUBSTANCES CONTAINING SAME.—No. 647,989; T. Ryan, Jr., Flint, and N. Hughes, Bagillt, Eng.

A process of extracting zinc from substances containing the same, consisting in subjecting the substances to action of caustic alkali, the various steps of the dissolving being so carried out that the solution of caustic alkali is brought in contact with several successive portions of raw material, and the various portions of raw material are each successively treated with different portions of caustic solution, precipitating any lead present by galvanic action, securing the removal of organic matters and iron manganese and silicon by the addition of caustic lime and bleaching powder, and finally precipitating the dissolved zinc in the form of zinc oxide or zinc hydroxide by the addition of carbonic acid.

ELECTROLYTIC CELL.—No. 647,960; G. W. Gesher, New York City, N. Y.

An electrolytic cell comprising portion of an alloy of iron and hydrogen, the latter being present in such proportion as to prevent the oxidation (induced, for instance, by chlorine), of iron in alloy, the hydrogen being present in the proportion of about $\frac{11}{100}$ of 1% and upward.

PROCESS OF EXTRACTING METALS FROM THEIR ORES.—No. 648,354; C. G. Collins, Woodsburg, N. Y.

Dissolving out or extracting metals from powdered ore by means of solution of ammonium salt in presence of an alkali base capable of decomposing ammonium salt, and then precipitating the metal by addition of solution of an alkali metal.

Grading Different Classes of Oil.

In nearly every oil field adjacent wells, within 100 or 200 feet of each other, vary materially in the gravity of oil. One well will produce a greater percentum of water with the oil, another a greater percentum of sediment, and consumers who desire to get the best results from the production consider the condition of the oil as it is delivered to them for use. The Los Angeles, Cal., Oil Exchange has adopted the report of a special committee, which practically does away with the different degrees of gravity, so far as the Los Angeles local field is concerned, and classifies the oil entirely as to its purity. The average gravity in the Los Angeles field is 14½°, and it ranges from 12° to 18°. The reason assigned for this basis of classification is that the great bulk of crude oil purchased between 12° and 18° gravity is used as a fuel oil, varying little in character except as to gravity. All crude petroleum between 12° and 18° is graded into four classes, as follows: No. 1, containing not to exceed 3% of water or sediment; No. 2, containing not to exceed 10% water or sediment; No. 3, containing not to exceed 20% water or sediment. Any grade containing above 20% of water or sediment will be graded as No. 4. No special difference in the fuel value of petroleum could be discovered between the gravities of 12° and 18° Baume. To ascertain the amount of water and sediment, the gasoline test was adopted. This test is as follows: From 50 to 100 parts of crude oil have added to them 50 to 100 parts of gasoline, which are well shaken to combine them, and are then submitted to a temperature not lower than 60° Fahr., and the precipitation during twenty-four hours will indicate the classification.

Some Observations on Practice of the Cyanide Process at Mercur, Utah.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by WM. MAGENAU, E. M.

As to the metallics, which consist of slivers of zinc with adhering gold, they are fused in ten-gram crucibles in amounts of not more than ten grams of metallics to each charge. The flux used is as follows:

	Grams.
Sodium carbonate	30
Litharge	35
Flour	¾
Silica	3
Borax	Heavy cover
Salt	Cover

When the total amount of metallics is small, say, under 10 grams, it may be all put in the charge, and results conveniently calculated by the formula given in Furman's Manual of Assaying; but if there are more than 10 grams, it is better to take charges of 0.3 assay ton in duplicate, calculating results as shown in the example here given, which will also serve to show clearly the various corrections applied. The proportion of metallics being comparatively small, no corrections except for slag were applied to these, and no account of the silver was taken. As a compensating error, the silver in the metallics offset the losses in cupels, so the "plus buttons" were taken as gold. All figures in the table are in milligrams.

	Gold + Silver	Gold	Silver	Slag Correction	Cupel Correction	Cupel	Inquartation	Corrected Gold
Pulp, .1 A.T.	179.77	178.40	1.37	1.48	.27	.09		180.24
"	179.81	178.27	1.54	1.23	.23	.07		179.80
"	179.82	177.32	1.60	1.92	.25	.08		179.57
"	178.50	177.06	1.44	1.60	.25	.08		178.99
			Av. 1.50					Av. 179.65
Metallics, .3 A.T.	69.00	.....	....	.75	...	...		69.75
"	70.50	.....	....	1.58	...	...		71.08
								Av. 70.41

= 23.47 in .1 A. T.

CALCULATION OF RESULTS.

1796.5 (mgs. in 1 A. T. of pulp) × 322.98 (grms. of pulp in entire sample) = 580233.57 (abstract number).

234.7 (mgs. in 1 A. T. of metallics) × 130.62 (grms. of metallics in entire sample) = 30656.51 (abstract number).

$$\frac{580233.57 + 30656.51}{453.6 \text{ (grms. pulp + grms. metallics)}} = 1346.7 \text{ (oz. gold per ton).}$$

Silver (taken directly from table) 15.0 (oz. per ton).

The purchaser's assay on this same lot was: Gold, 1339.0 oz. per ton; silver, 18.9 oz. per ton. This makes a difference of 7.7 oz. gold per ton in the two results, which was an unusual discrepancy, yet on a 500-lb. shipment whose value would be about $6700, the difference in total value by the two results is only $38.50. The difference in silver is inconsequential.

The question of local refining of product has received much attention in the district at the hands of the larger companies with capital enough to attack a problem which presents so many difficulties and discouragements. A few analyses made by the writer will give an idea of the chemical complexity of the material. These results are taken at random and do not represent average figures, except No. 1, which is an average sample of product from about 20,000 tons of ore, and No. 6, which is an analysis by H. W. Fox, ex-chemist of the De Lamar plant, representing product from over 150,000 tons.

	No. 1. %	No. 2. %	No. 3. %	No. 4. %	No. 5. %	No. 6. %

	100.00	100.00	100.00	100.00	100.00	100.00

The partial analyses given in Nos. 2, 3, 4 and 5 will serve to give an idea of the variation in the chief constituents. A consideration of these results will make evident the difficulty of treatment. The one feature of low tenor in gold at once excludes several methods which are applicable to richer products. Direct melting with fluxes would of course be very expensive and produce large amounts of slag requiring rehandling, and probably cause high losses of precious metal. Preliminary treatment with acids on a moderate scale would be high in cost and require more of a plant and better metallurgical skill than most of the plants have been willing to provide. One, however, which had both these requisites (the De Lamar) was able to refine on a large scale by treatment with sulphuric acid, copious washing (to remove Zn SO_4 and Ca SO_4) and subsequent digestion with a comparatively small amount of nitric acid, which removed arsenic and various other impurities, together perhaps with some of the little silver present.

This was carried on until several lives were lost by the accidental mixing of some zinc dust with a waste solution charged with sulphuric acid and arsenic, the result being generation of arseniuretted hydrogen.

Appreciating the danger to operators the method was abandoned and the mill's product sold to smelters, while systematic efforts were made to devise a safe, economical process. This instance is an admirable illustration of the adaptation of theories to practice and of faith in these theories sufficient to involve the expenditure of large sums in experimenting on a large scale—the only way to demonstrate their applicability or unfitness to the case in hand.

An attempt was made to refine by distilling off the zinc in Faber du Faur furnaces after mixing with charcoal and lead (as in the Parkes process for desilverization of base bullion). The auriferous lead was then to be cupelled. This failed on account of the impossibility of reducing the large proportion of zinc oxide present (the product having been muffle-dried before charging into the Faber du Faur) with the temperature it was practicable to attain. The persistent retention of combined water, which caused explosions in the distilling furnace, was also bothersome, and these considerations together with other mechanical difficulties led to an abandonment of the plan.

Various other schemes were evolved, but all presented prohibitory obstacles, and it was decided to return to the original sulphuric-nitric treatment, with various improvements in the mechanical details and very complete arrangements for insuring the safety of operators. A close-fitting hood is placed over the immense dissolving tank and a 20 H. P. fan makes it quite impossible for any fumes to escape to where they might do damage. This plant is now in successful operation and turns out very clean bullion, averaging .950 fine in gold.

The only other recent attempt at local refining was made by the Mercur Gold Mining & Milling Co. in 1899. A somewhat elaborate plant was put up and a few trial runs made, but although it was undoubtedly a technical and financial success, its use was discontinued for reasons not made public. This process, which is patented by J. H. Burfeind of Salt Lake City, is based on the solubility in water of bisulphites of zinc, lime, etc., these being formed by action of SO_2 gas on the material suspended in water.

CHEMICAL CONSIDERATIONS.—To return to the essential operations of cyaniding, a brief statement of a few chemical problems encountered may be of interest. Perhaps the chief of these, and one whose importance cannot be too strongly emphasized, is the determination of KCy in the mill solutions. Nearly every writer on cyanidation has declared the need of a better method for this determination than any now known, but nowhere is this need so pressing as in the Mercur district. The following table gives results of titration of a representative solution by recognized methods which are briefly described in the footnotes. All figures represent pounds KCy per ton of solution:

Method	(a)	(b)	(c)	(d)	(e)
Result	1.1	4.6	1.0	1.4	3.0

In all these a standard solution of silver nitrate was used, its strength being such as to make the burette-reading in c.c.'s equal pounds KCy per ton of solution on a 10 c.c. sample (6.535 grms. $AgNO_3$ per litre).

Ten c.c.'s of solution were taken in each case.

(a) Titrated direct, without dilution, and without any indicator, to first opalescence.

(b) Titrated, after dilution with 50 c.c. distilled water and without any indicator, to opalescence.

(c) Titrated without dilution after addition of a few drops of a 5% solution of potassium iodide.

(d) Titrated after dilution with 50 c.c. water and a few drops of potassium iodide solution.

(e) Titrated after dilution with 50 c.c. water and addition of 1 drop 5% solution of potassium ferrocyanide.

In nearly all cyanide fields differences of a few tenths have been observed, but here we have results varying by several hundred per cent, and it is evident that figures given for strength of mill-solution in use are of absolutely no value for purposes of comparison, even when the method of determination is stated, since it is not known which of these gives the correct amount of KCy.

More important than the actual amount of KCy, is a figure representing the "dissolving strength," as Bosqui calls it, and it is yet to be determined to which of the above results, if any, this is proportional. While all of them vary with the strength of the solution in KCy, they do not vary in the same proportion.

The above results were obtained on a sample of solution which had been used for treating many thousand tons of ore, with, of course, constant additions of KCy and wash water. An investigation was started to determine the cause of differences by the various methods, but before the analysis was completed the sample was lost through an accident, and there was no opportunity for securing another, so the conclusions to be drawn from the following figures are provisional, because based on certain assumptions. At some future time the writer hopes to verify these by analytical results.

ANALYSIS.—Total matter in solution (residue dried to constant weight at 100°C.)—0.27%.

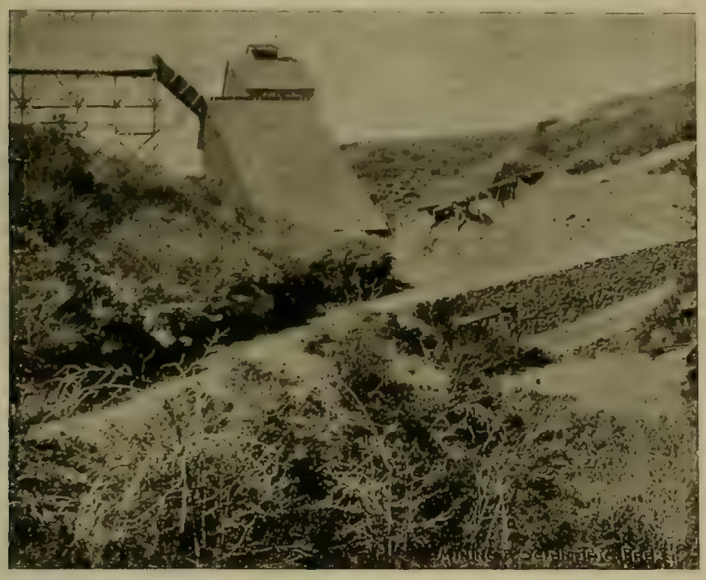
	%
Zn	.062
Ca	.005
Mg	.0009
Fe	Trace
SO_3	.0102
$K_4Fe\,Cy_6$	.0002
KCy S	.0015
Cy	.092 (see note a)
Combined water (see note b)	.0018
K (see note b)	.1000

Alkalinity (expressed in number of c.c.'s $\frac{n}{10}$ acid required to neutralize 100 c.c. solution, using methyl orange indicator) 19.6.

Note (a). By Sharwood's method of titrating with $Ag\,NO_3$ solution in presence of ammonia and potassium iodide. (See Jour. Am. Chem. Soc., Vol. XIX, No. 5.)

Note (b). These two results are assumed as being the probable composition of the difference between the sum of ingredients already accounted for and the total solids in solution.

Methods (b) and (d) gave the sharpest end points, and one or the other of these is used in the mills of the district, although, as previously stated, it is not known that either of them give results strictly proportional to the dissolving strength. Considering the theoretical correctness of the methods, as expressing the amount of actual KCy present, a study of the analysis, as far as its incompleteness allows, leads to the conclusion that method (d) is nearest correct. As to an explanation for the wide discrepancies none can at present be offered, and may be found to lie in the presence of some complex organic compounds now unsuspected.



It is frequently stated that the above-mentioned recognized methods are all that are needed in practical millwork so long as any one is adhered to throughout, and this is sometimes true after actual trials on the large scale have taught the operator what the result means on his own particular solution, but such large-scale experimenting is very costly, and the writer has several times seen hundreds of pounds of cyanide sacrificed for want of an accurate analytical method, while very possibly there is a constant unseen waste on the same acccount.

The matter of adding quick or slaked lime has received general attention and in some cases been found to be a positive sine qua non. Alkaline washes are not used.

While much of the ore does not show a noteworthy amount of acidity by the ordinary test, which, by the way, is of little use in gauging the amount of lime to be added, a general good effect is observed by the admixture of from ½ to 2 or 3 pounds of lime per ton. The precise chemical action is not known; but, as a general thing, the consumption of cyanide is reduced and the precipitation improved. It is often by this latter operation that the amount to be added is judged, the activity of the zinc being proportional to the alkalinity of the solution. In one mill it was found necessary to use as much lime as twenty pounds per ton to obtain clean precipitation, which latter was also accompanied by several curious phenomena, among them the deposition of the gold in bright metallic films, and this from extremely poor solutions. This occurred especially when the alkalinity of the solution fell below a certain point and seriously impaired further precipitation.

SILVER CYANIDING.—There are but two silver cyanide mills in the district—the Northern Light and Chloride Point. A considerable tonnage of ore ranging from two to twenty ounces in silver per ton has been treated, and there seems to be no technical difficulty. The general system used is the same as for local gold cyaniding, with the difference of stronger solutions and longer treatment. Zinc-shaving precipitation is used and a very high-grade product is obtained, the solution being about 100 times as high in metallic contents as the solution in gold mills.

The percentage extracted from the ore is lower than for gold ore, being from 60% to 70%. As experienced in other fields, the silver dissolves in the same proportion as it is present as chloride.

Gold King Mill, Banner, Cal.

(See Page 494.)

As to Ore Testing.

There are assayers who believe the prospector should be "encouraged" by overstating the value of his ore and who habitually give small returns, from a "trace" to a few dollars a ton, upon ore which they know to be barren, thinking to keep him at work upon a prospect which will yield nothing, spending valuable time and money to no purpose, save that of giving a few dollars worth of work to the assayer. Perhaps the prospector sends samples to two different assayers, and one returns him "no trace" while the other gives him a value of a few dollars per ton. The biggest return is usually accepted as correct, and the "no trace" man is charged with a failure. Some assayers say it makes no difference whether they return "no trace" or a dollar or two a ton, because in neither case is the ore of any value, but the accuracy of an assay of ore of very low grade is more important than that of an ore carrying a hundred dollars per ton; in the first case a difference between "no trace" and a dollar or two may decide the expenditure of hundreds or perhaps thousands of dollars in development, while in the latter, the ore will be shipped anyway; and all know that the smelters will pay for nothing but the actual contents of the ore. These returns of value from valueless ore are often the result of accident or carelessness in the hands of an assayer who has every intention of being honest. A particle of rich ore in the grinder left from the last sample, a salted crucible, a loaded cleaning brush, a dirty mixing cloth, fluxes containing a little precious metal, these and other matters of carelessness, uncleanliness or disorder about the laboratory make the difference between reliability and worthlessness in the result of assaying. The general public is not competent to judge of the qualifications of an assayer any more than those of a physician. Any man may buy an outfit for $100 and stick out his shingle "Chemist and Assayer," when in reality he knows nothing about the correct application of the principles underlying the trade he professes. Such instances are more common than many would believe, and sometimes people of intelligence who would at once realize the foolishness of hunting out the cheapest lawyer or doctor will give their patronage to such an assayer just because they can get his services a little cheaper than those of a man who is competent in his profession and who realizes the importance of taking pains.

A good assayer is often charged with failure because his customer is ignorant of the first principles of sampling ore. Sometimes a piece of rock is broken in two, the halves sent to different assayers, widely varying results are obtained, and one of the operators is charged with an error, when in fact both are correct, and the results are chargeable to the fact that the metal was evenly disseminated through the sample. It is well to remember that like results can only be reasonably expected when the sample is finely crushed, thoroughly mixed and carefully divided. The careful miner will treat his sample in this way, grinding as fine as his circumstances will permit, mixing and dividing carefully, and in every case reserving a portion of the sample so that a check assay can be made if desired. As the best men are liable to an occasional mistake, no conservative miner will expend any large amount of labor or money upon the result of a single assay, but will base his future work upon the concurring results of two or more reliable assayers.

The best practical test of the qualifications of an assayer is his ability to check with the smelters on their shipment pulps, and if you are in doubt with whom to trust your work go to your friends who are ore shippers and get them to tell you who they patronize. No man can be honest in this business without making many enemies among those customers who have had higher assays elsewhere than he can give them and who had rather believe their assayer dishonest or incompetent than that their ore is less valuable than they hoped. Remember that good men as a rule can get a fair price for their work. If there is any trade in which "cheap" work is utterly valueless it is in that of the assayer.

Union Steam Pumps.

The two illustrations herewith are from patterns of the Union steam pump made by the Union Steam Pump Co. of Battle Creek, Mich. Fig. 1 is intended to show how the inside of the pump would look were the shell made of glass instead of iron. The steam valve in its relative position as regards the piston; the trip steam tube attached to the piston head, and its accompanying reservoir into which it slides and from which it takes its steam with which to trip the valve, also the guide pin upon the piston head to keep the piston in one position and prevent turning of the rod when packing the water end. The cut also shows how the valves, water courses and other openings appear in their relative positions as regards the other parts of the pump. The "phantom" shows the whole pump with air chamber. Upon a small cut of this kind the upper openings cannot be shown, but the reader will bear in mind that, through proper portings, the piston head, which is double, having in its center a periphery or channel, guarded by expanding steam rings, is always charged with boiler pressure steam, which at each stroke registers with a port leading into and in front of the valve head, exerting a boiler pressure force to throw the valve in advance of the finish stroke of the main piston; boiler pressure being eighty pounds, this relative pressure is exerted on each square inch of surface on the valve head.

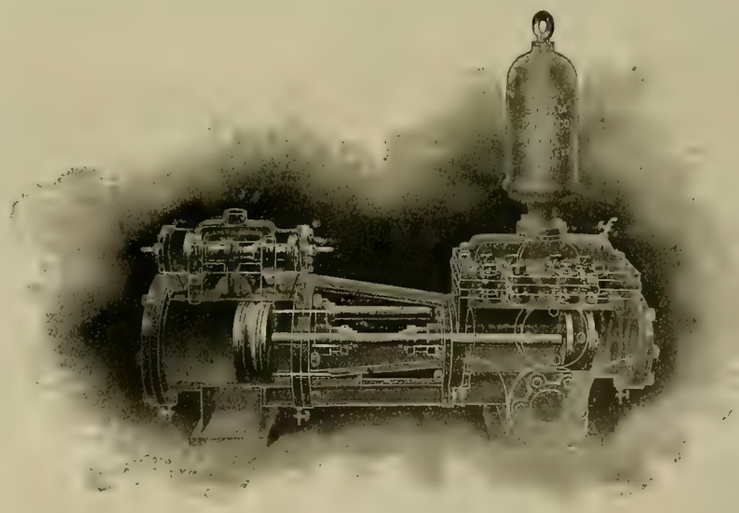

Fig. 1.—Union Pattern "Phantom."

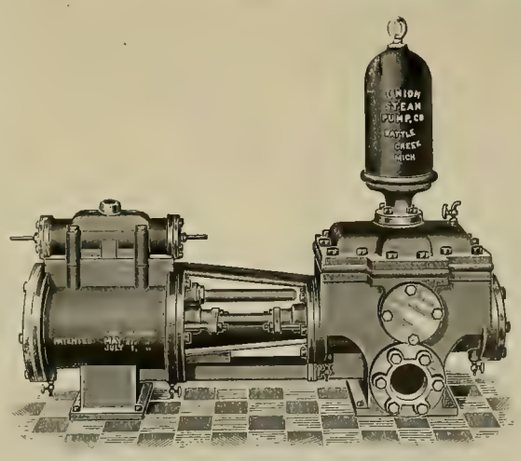

Fig. 2.—Union Pattern, Size 8½x5x10.

Fig. 2 is an ordinary view of the same pump. A handsome illustrated catalogue will be sent upon request to any address by the makers.

At Washington, D. C., this week the House Committee on Public Lands decided to report favorably Commissioner Hermann's substitute for the De Vries California mineral lands bill.

Lead Supply and Demand.

New uses have been found for lead. One of the most important is that of constructing storage batteries for all motor carriages run by the motor carriage system; that each motor carriage carries on an average of 300 pounds of lead. The construction of underground conduits for the use of telegraphic, telephonic and other companies has caused a large absorption of this metal and will continue to do so. As cities and towns increase in business and importance the demand will increase, as it is a metal for which it is not easy to find a practicable substitute. But while these new avenues for the consumption of lead are being opened and the absorbing power of this country and of the world is steadily increasing, there has been but little increase in the output of lead products. Nor is there likely to be much of an increase. Silver mines carrying lead which were closed down on account of the low price of silver are not likely to be opened up to a disturbing extent of the market unless there should be a sudden rise in the value of silver bullion, which is not likely.

MINING SUMMARY.

ALASKA.

Forty Mile river is to be diverted from its channel this summer and turned into a canal 40 feet deep and 60 feet wide, which five Americans have been digging for fifteen months past. They expect to complete it this summer for a distance of 200 feet and lay bare nine creek claims.

Charles W. Garside writes from Cape Nome: "Nome City, Jan. 14.—Have completed a survey of the first section—Fort Clarence to Fort Safety, 114 miles—of the Alaskan & Siberian Railroad, Kaltag, on the Yukon river, to Point Spencer at Point Clarence. Started Nov. 15; completed the survey Jan. 11. We had thirty-five Siberian dogs, five Siberian sleds, Siberian dog drivers, ten men and a cook. Have had little time to spend on the creeks. Nearly all the creeks were located before we arrived on the ground, mostly by power of attorney. The country is not as rich as Dawson, but much more easily worked, being very shallow. Our expenses since arriving at Nome have been a little over $4000. Everything is very expensive—coal $150 a ton, lumber $300—but there is not as much shortage as has been reported."

A new mining district is reported north of Nome and east of Cape Prince of Wales—the Kanowgok mining district—the rivers and streams flowing into Bering sea. Eight claims are located on Bituk creek, which flows into Port Clarence, by men grubstaked by J. J. Healy last fall.

In a letter written at Nome, January 13th, H. Leland says: "The whole country is staked from one end to the other; and every claim which was known to be of any value, and also hundreds of them which never had a pick stuck in them, were staked and restaked until some of them had as many as twelve and fifteen different stakes on them. There are no three people in town who have the same time, and the different people who staked the same property claim were there at 12 o'clock on the night of December 31, 1899. Some claims were restaked on the ground that the assessment work had not been done, some that the original stakers were aliens and all sorts of other reasons were given, the result being that when spring opens there will be no end of litigation, and the lawyers will reap a harvest."

ARIZONA.

COCHISE COUNTY.

The Prospector hears the Copper Queen Co. at Bisbee have opened up a rich body of ore in their new working shaft, that they are now sinking upon the Spray mine. The company chose the spot upon which this shaft was started because it was believed they would encounter no ore here. They desired to have solid limestone all the way down, that the shaft would remain more substantial than if sunk in ore that might afterwards be worked out from around the timbers, interfering with their alignment. The shaft is down 550 feet, a four-compartment shaft 24 feet in length and 8 feet in width. At this depth the entire shaft is reported by the Prospector to be in copper ore that runs 50% and is also rich in silver. This shaft is about three-fourths of a mile south of the Copper Queen smelters.

COCONINO COUNTY.

(Special Correspondence).—Along the Colorado, through southern Utah and northern Arizona, from where Dirty Devil river empties into the Colorado to this place, 150 miles, a New York company, managed by R. B. Stanton, will dredge, starting this summer. The Bucyrus Co., South Milwaukee, Wis., has built them a dredger to daily handle 2000 cubic yards gravel. The part prospected shows an average of 20 cents. This season the dredger will be run by a gasoline engine. The intent is, if it pays, to put in an electric plant and another dredger and work both by electric power.

Lee's Ferry, April 25.

GRAHAM COUNTY.

The Lone Pine group of mines is reported sold to the Turn Bull Syndicate of Safford for $20,000. The property is 15 miles south of Ft. Thomas. It is a copper proposition, carrying ore about 30%.

Jno. Belser will superintend operations of the Rockwell M. Co., which has bought a group of claims in the Aravaipa district.

The Mount Turnbull Copper M. & S. Co. have begun work on their Copper Bell property.

MARICOPA COUNTY.

The O'Brien mine, at Gilbert, near Wickenberg, that Brown & Co. have bonded, is having two tunnels driven and a shaft sunk. The company has forty men at work. They have a 22 H. P. gasoline engine in place and connected up, and will run their 10-stamp mill and concentrator. The water supply is 2 miles away and is pumped by a 12 H. P. gasoline engine.

MOJAVE COUNTY.

Post: At Chloride the Cannon-Minnesota mine is treating 200 tons of ore each twenty-four hours. The ore body is of a size to put on three eight-hour shifts of men.

The strike at the Pay Roll mine is holding out. The new ore body is in a 175-foot east drift from the 300-foot shaft, 6 feet wide. Three shifts of men are engaged on this part of the mine. Mgr. C. Timmons has ordered a 100-ton concentrator, to be in operation June 1.

The Lucky Boy mine is yet in its body of "mahogany" ore. Three shifts have been at work since it was first broken into and shipment of one carload a week has been made. The Lucky Boy belongs to a Chicago company, who bought it last summer from J. Smithline for $15,000.

YUMA COUNTY.

Treating the tailings by the cyanide process at Harqua Hala some years ago was of resultant profit. There was a saving of 76%. The cost of the treatment of the tailings is here given in detail:

Supplies—	Per ton. Cents.
Cyanide of potash	26.63
Fuel	12.87
Lime	4.40
Zinc	0.61
Sundries	1.55
Tramway and engine repairs	1.18
Packing, waste and lubricants	0.66
Assay office	2.42
Freight and express	3.84
Telegrams and postage	0.76
Stables	5.06
Total	59.98
Add water supply	9 87
Royalty	10.00
Total	79.85

Labor—	Per ton. Cents.
Superintendent and foreman	7.29
Experts	3.32
Shift boss and helpers	8.04
Assayer and melter	3.92
Mechanic and engineers	8.59
Firemen and mine pumper	5.63
Carmen and crushermen	5.35
Signals, tailings and scrapermen.	7.06
Stables, watchmen, blacksmith and woodpiler	5.38
Total labor	54.58
Add supplies	79.85
Legal expenses	1.73
Taxes and insurance	4.45
Total cost	140.61

The total yield was $3.21 per ton, leaving a profit of $1.80 per ton of tailings worked.

CALIFORNIA.

AMADOR COUNTY.

At Sutter Creek $70 ore is being treated at the Zecla mill from the Central Eureka. The shaft is now nearly 1700 feet deep.

At Jackson the new vertical shaft of the Kennedy is to go 3000 feet; it is now down about 1200 feet.

At the Newton copper mine a reduction works and a large force of men are talked of.

At Amador City, the Fremont Consolidated mine shaft is being unwatered. The Gover will be unwatered this season.

At the Pocohontas mine, Drytown district, sinking has been resumed.

The Centennial mine shaft at Drytown is down 630 feet. The ore shows some free gold and the sulphurets are high grade.

CALAVERAS COUNTY.

H. J. McSorley is superintending sinking operations at the Camanche G. M. Co.'s gravel mine on the Mokelumne river, below Camanche. Bedrock is expected at 215 feet. In the river bed at that point in the early fifties, the Prospect says, several tons of gold in all were taken out.

The Cook mine at Campo Seco, owned by the Standard Oil Co., has a new 10-stamp mill, just completed, which began crushing this week.

Ben and Lewis Williams, the men who made the Copper Queen mine at Bisbee, Ariz., have bought a California property—the Old Napoleon, near Milton—and will proceed to make a mine of it. The shaft filled with water in 1865, and nothing has been done for thirty-five years. Messrs. Williams will unwater it, put in suitable machinery, and have sent for their old foreman, John Andrews, to take charge of the work.

EL DORADO COUNTY.

The Georgetown Gazette hears that the Big Sandy mine at Kelsey will start up again with J. Kelley as Supt.

KERN COUNTY.

At Randsburg the Red Dog mill is working on 300 tons of West Shore ore.

The Butte, under Supt. Miner, is turning out 300 tons at $18 per ton.

Mining Review: Willard & Hammond have cleaned up $2750 from the Val Verde. It went about $13 per ton.

Bakersfield Californian: The first flowing well to be bored in the Kern river district has begun to yield up oil by its own efforts. The well is the San Joaquin Co.'s No. 5 on section 5, 29, 28. Lower oil-bearing stratum has been penetrated and 328 feet of the sand obtained. Subsequently it was sand pumped, which work was continued up to date. When sufficiently cleaned the oil began running over the casing and is now flowing at the rate of twenty-five barrels per day.

MARIPOSA COUNTY.

The Boston News Bureau, published where the stock is owned, says that at Coulterville new ore shoots have been discovered at the Merced properties besides the Mary Harrison gold ore shoot, upon which a shaft is now being sunk to the depth of 1000 feet, and that the management feels encouraged.

NAPA COUNTY.

(Special Correspondence).—Near here is a deposit of white carbonate of magnesia 6 feet thick, imbedded at an angle of 65° between walls of serpentine and talcose schist.

Rutherford, May 2.

The Ætna Con. Q. M. Co. reports that it owns 350.48 acres land and 578.32 acres mining claims, with reduction works at Lidell; capital stock $500,000. For the year ending December 31, 1899, total receipts from sales of quicksilver were $154,552; total expenses, including $2679 for repairs and construction and $2366 for depreciation, $86,190; net earnings $69,058; dividends $50,000; surplus $19,058; adding balance of $56,532, brought over from previous year, made total surplus at close of year $75,590. The mining statement is as follows:

	1898.	1899.
Tons ore smelted	18,394	18,084
Quicksilver produced, flk's	3,450	3,800
Quicksilver produced, lbs.	263,925	290,700
Metal obtained, %	0.72	0.80
Drifts and tunnels run, ft.	2,385	2,740

Receipts were $8.58 per ton smelted; expenses $4.76; profit $3.82.

NEVADA COUNTY.

Sedimentary rocks, chiefly referred to the Calaveras formation, occupy small, usually narrow and long areas imbedded in the predominating igneous masses. Granodiorite occupies a large part of the Nevada City and Banner Hill districts, while a small massif of the same rock is found in the Grass Valley district. Large areas of diabase, porphyrite and brecciated forms of these rocks surround and separate the granodiorite areas. In the southwestern part of the Nevada City district and the northeastern part of the Grass Valley a large and complicated massif is found, consisting in part of diorite, in part of gabbro, pyroxenite and serpentine. The slates of the Calaveras formation are the oldest rocks. Next younger are the diorites, gabbros and serpentines. Still later are the diabases and porphyrites, and the intrusion of granodiorite closes the succession of igneous rocks.

The bedrock series is, as usual, in places covered by several hundred feet of Neocene gravels and rhyolitic and andesitic tuffs, the gently sloping top of the andesitic ridges forming a principal feature of the landscape. The Neocene auriferous gravels have been extensively worked in the Nevada City and Banner Hill districts, both by the drifting and the hydraulic processes, and considerable ground still remains which probably can be profitably worked. The gold quartz veins are numerous and belong to several distinct systems. They are found in any of the ordinary formations, and generally cross the contacts without change. In the Banner Hill district the veins are narrow but rich, and have a general east-west direction and a northerly or southerly dip.

In the Nevada City district the quartz veins have a general north-south direction and an easterly dip of about 45°. Large dislocations producing overthrust faults have occurred along several of the veins. In the Grass Valley district there is one system with a west-northwest direction and a steep northerly or southerly dip. On this system the Idaho mine is located. Most of the veins in the central and southern part of the district have a northerly direction and a flat easterly or westerly dip. The veins are often accompanied by strongly developed sheeting of the country rock.

Near the Brunswick, at the Union, E. C. Creller has erected a plant larger than the Brunswick's; he has a 16-inch pump, with heavy driving machinery. The spur wheel weighs fourteen tons. Preparations are being made for the erection of a mill. Both these mines have large ore veins and the rock is good.

Herald: The hoisting and pumping plant at the Brunswick mine, Grass Valley district, is the old rig of the Justice mine, Virginia City, Nevada. The spur wheel on the pump rig weighs thirteen and one-half tons. The bob runs a 14-inch plunger pump.

Union: The fourth installment on the purchase price of the Nevada City mine by the Champion M. Co., $8000, is paid. The next payment will be the last one. The property will then be held by the Champion Co.

PLACER COUNTY.

A special meeting of the stockholders of the Pioneer G. M. Co. will be held May 31 at Helena, Mont., when a proposition will be laid before the shareholders looking to the raising of a sum sufficient to carry on development work.

PLUMAS COUNTY.

At the Hallsted mine men are preparing for building the 20-stamp quartz mill, a boarding house and other quarters.

Mgr. Andrews is expected to resume work on the Rich Bar mine this week.

RIVERSIDE COUNTY.

The Lost Horse mine, Pinon mining district, has been bonded to U. S. G. Todd of Los Angeles for $200,000, says the Express. The owners of the mine, Ryan & Kelsey, have agreed to accept $100,000 April 25, 1901, $50,000 October 25, 1901, the remaining $50,000 April 25, 1902. Mr. Todd expects to secure water supply from springs that he owns six miles from the mine. A company is to be organized to operate the property.

SAN BERNARDINO COUNTY.

Ore from the Old Shoes mine at Manvel assays $32 in gold, silver, copper and lead. G. O. Pearse says he has sold the Old Shoes and other claims for $20,000 to T. A. Garey of Los Angeles.

At Gold mountain sixty men are preparing for the 40-stamp mill. It is locally asserted that, if the mine proves what it promises, the 40 stamps will be followed by 100 more. The supplies are taken in by way of Victor. The batteries and some parts of the old Baldwin mill are being utilized in the construction of the new mill.

SAN DIEGO COUNTY.

(Special Correspondence).—Julian district, which has had its ups and downs for thirty years, is fairly active. The slate formation of this district is noticeable. There is a peculiar vein structure as noted in the Ready Relief mine, where the ore is a silicification of mica slates crumpled into complex folds. A photo is sent of the Helvetia hoist and mill (see page 493). At the mouth of this mine thin-bedded argillaceous slates strike north 75° west magnetic, and dip 70° northeast. These slates are hard and tough. In the tunnel the slates are soft and can be worked with the pick alone. The mine has had varying fortunes, being owned by local people, then a Los Angeles company, then the Pacific Bank of San Francisco, later by local people again. It has yielded about $500,000, and with proper tunnel development could probably be made a producer again. It is to be actively worked this season.

Dr. Stanley has moved his cyanide plant from Banner to Mesa Grande.

In the Banner district D. C. Collier Jr. has bought for $10,000 the Cincinnati Belle and Gold King. The latter is of some note, having yielded quartz ore going $100 a ton. With this is a photo of the Gold King mill (see page 493), which is 11 miles from Banner, which has crushed for the Cincinnati Belle and Gold Queen, an adjoining mine. The Gold King mine is 4 miles southwest of Banner. Like nearly all the other mining properties in this section it has changed hands quite frequently, and like the others, needs only capital and intelligent development to be made a good paying property.

At Julian the Owens is yielding well. The Kentuck S. tunnel at Banner is in every way favorable.

Julian, April 5.

At Hedges at the Golden Cross M. Co.'s property last week a blast of 115 kegs of powder was set off and shattered several tons, to be gathered up for the mill.

SAN LUIS OBISPO COUNTY.

The Adelaide quicksilver mine is sold to the K. K. Q. M. Co. for $50,000. It was formerly owned and operated by A. Dubost.

SHASTA COUNTY.

D. B. Hunt has taken a six months' development bond on the Hiatt mine, Buckeye district.

The Donkey mine, Furnaceville district, has been bonded to Tibbitts & Shannon. The bond requires $12,500 August 1, 1900, and $12,500 at the end of twelve months.

In Churntown mining district Wolf &

Sleiger are shipping ore from the Arab mine to the Keswick smelter.

Searchlight: At the Mountain Copper Co., Iron Mountain, the pay of the timbermen is increased from $2.75 to $3 per day; machine men, $2.75 to $2.85; miners, $2.60 to $2.75; muckers, $2.10 to $2.50; laborers, $1.90 to $2.

Free Press: There is considerable activity at the Hart mine in Old Diggings, now under bond to the Texas M. Co. The ore is sorted and shipped in sacks by team to the Keswick smelter. The extension of the wire ropeway across the Sacramento river to the spur on the main line of the S. P. Co. is completed. H. C. Woodrow is Mgr.

SIERRA COUNTY.

Supt. W. B. Dunlap will resume operations at the Alaska mine, Pike City. He proposes to put up machinery on the old works and pump out the shaft.

SISKIYOU COUNTY.

At Mill creek the Gum Boot mine has twenty men employed. The mill is busy day and night.

Parker & Smith, near Summerville, have two giants at work; there is plenty of water to last till July.

J. Panter of Chicago has a steam drill prospecting gravel ground in the old Hop Lee mine. Should the prospect prove satisfactory, a dredger will be built.

Journal: Copper mines in Preston Peak district, on the Siskiyou and Del Norte county boundary line, are attracting interest, several claims having been taken up.——Prospecting for dredger operations on McAdams creek is progressing.——Mgr. Baker will start work on the Cherry Hill quartz mine, at Cherry creek, on a bond.

TUOLUMNE COUNTY.

Twenty-five men are working at the Kanaka. The mill is in operation.

F. Deidesheimer has bonded the Two Brothers mine, near Groveland.

At the Santa Ysabel operations have been suspended pending the special meeting of the stockholders on the 30th inst., when consideration will be given to a reorganization of the company, involving an assessment of $1 per share on the stock. Properties adjacent to the Santa Ysabel continue to make good reports.

Democrat: The Starr King mine, three and one-half miles southeast of Carters, is to be opened up and operated.——The Poison Oak mine is to have a mill. Supt. Spatz will select the machinery.——The bodies of rich ore struck in the Jumper mine hold out, and the April yield was large. The general offices of the company are now located at the mine.

Independent: The twenty stamps at the Confidence are busy.——The main shaft of the Rawhide will soon be 1800 feet deep.

COLORADO.

BOULDER COUNTY.

Jas. Tonkin is to operate the Struggler mine near Ward.

The Delano mill (formerly the Atlas Reduction Works) is now running to its full capacity.

At Frances three eight-hour shifts are driving the Adit and Ni Wot tunnels and two shifts are working in the Dew Drop. The Ni Wot tunnel is in over 1800 feet from its connection with the Adit tunnel. The latter tunnel is in over 3900 feet.

T. R. Mann, of Boulder, has bought the American mine at Sunshine. After the oxidized ore was worked out and the sulphides were reached at water level, the mine was closed; operations then resumed and a body of low-grade milling ore was found, running from $12 to $15, which will be treated at the Culbertson mill at Boulder.

CLEAR CREEK COUNTY.

Near Empire, Ohio men have begun systematic development of the Maud S. mine. The Post says ore is being stoped in a drift running 200 feet on the vein from the point tapped by the upper crosscut tunnel, and shipments of three carloads, one of solid, two of concentrating stuff, exhibit the usual character of the Douglas mountain product—that of the silver-lead carrying about $5 in gold to the ton.

Tellurium ore has been found by J. W. Shaw on the Nonpareil, near Idaho Springs. The streak is 3 to 4 inches wide, and assays up to $10,000 a ton.

CUSTER COUNTY.

The Bassick mine has been unwatered, the shaft retimbered and sunk to the 1300-foot level, and a drift started from the latter level to cut the ore body.

GILPIN COUNTY.

The Gower Mines syndicate is operating the Running Lode near Black Hawk.

LAKE COUNTY.

The Home Co. is daily shipping 400 tons of ore, a large proportion of it high-grade chlorides.

The Nil Desperandum, on Rock hill, has reached the contact at a depth of 640 feet. The ore runs 25% lead and about forty ounces in silver per ton.

Work is to be resumed on the Sedalia, Little Ellen hill. A station will be cut this week, when the shaft will be 80 feet deep.

MONTROSE COUNTY.

Near Bedrock, the La Sal M. Co. has finished driving through 50 feet in length of its tunnel in ore, which is 16 feet in width and carries 60% copper and 200 ounces silver, besides gold values. They are shipping the ore to the Argo smelter in Denver. This mine is in sandstone.

SAN JUAN COUNTY.

Post: Silverton ore shipments are increasing, now being twelve cars of concentrates, representing in crude ore 650 tons per day, the concentrates average value being $75 per ton.——The Gold King has added forty stamps to the mill.——The Iowa is completing a new tramway.——Mgr. Terry of the Sunnyside is in Denver purchasing stamps to put in the new mill at Eureka in place of the speed rolls.——In Arrastra basin about 450 men are employed on the Silver Lake, Iowa and Tiger mines; this force will be increased until by June 15th 650 men will be at work in the basin. The Silver Lake is shipping four cars of concentrates per day —fifty tons.

SAN MIGUEL COUNTY.

E. E. Bassett is shipping ore from the Silver Bell, and J. B. Tendrick from the Attica, near Ophir.

Near Telluride, the first clean-up at the new Bessie cyanide plant was satisfactory. A new cyanide plant is being built upon the San Miguel river, twenty miles below Placerville. R. Burns is Gen. Mgr. Mgr. Casey is operating at the Keystone placer property. It is calculated 1000 yards will be handled per day. About 100 feet more riffles are added. Below these riffles a grizzly has been put in the bottom of the big sluice, all the finer sand and dirt sinking through this and passing through another sluice with Hungarian riffles.

SUMMIT COUNTY.

Near Breckenridge, the Gold Pan Co. is testing gold gravel.

J. H. Myers has returned to Frisco from Chicago, where he organized a company to drive a tunnel near the Excelsior mine to develop a group of fourteen claims.

TELLER COUNTY.

(See illustration front page.)

(Special Correspondence).—With this is forwarded to you a view of the plant of the Economic Gold Extraction Co., near Victor, in Cripple Creek district. The plant is controlled by the Wood's Investment Co., and operates on ores from the Gold Coin, Jack Pot and other mines operated by the Wood people under various corporate names.

Power at the Economic mill is supplied by the La Bella electric plant at Goldfield and by the Colorado Electric Power Co.; but before the end of this year the power will doubtless be supplied by the Pike's Peak Power Co., whose electric plant is being built on Beaver creek, twelve miles from Victor, the same also being a promotion of the Wood's Investment Co.

In the mill are eleven motors, aggregating 300 H. P. It is claimed the division of the power by this number of motors obviates the necessity of having so much line shafting as would be required with the power centered in one or two motors, and also reduces the friction.

The ore is carried from the bins by belt conveyors to the crushing floor, below which are a series of gyratory crushers, the product from which is elevated and automatically sampled and carried to the drying bins, the heat for the latter being supplied by the waste heat from the roasters. From the driers the material passes, by conveyors, to the coarse and fine rolls, of which there are six sets, 16x36 inches, reducing it to not less than 16 mesh, though much of it is a great deal finer. In this dry, pulverized condition the ore is conveyed to the roasters, of which there are seven of the Argall cylindrical, revolving, four-compartment pattern, each 37 feet long, tile-lined. The heat is from coal, fed automatically by stokers, and with blowers to accentuate draft and drive the heat to all parts of the roasters. Each roaster has its own cooling device, beneath the roaster floor, the latter being of cement and metal arches, making it fireproof.

From the roasters and coolers the material passes by elevators to bins above the chlorinating barrels, where it is weighed by portable scales. There are seven chlorine barrels, each 7 feet diameter by 17 feet length, with capacity of eighteen tons. They are, perhaps, the largest barrels made, and were turned out by the F. M. Davis Iron Works of Denver.

The barrel solution containing chloride of gold passes to a system of lead-lined tanks, in which sulphuretted hydrogen is used as a precipitant, producing a sulphide of gold. After collecting in filter presses the process is completed in the refinery, where gold bars are produced. The reduction plant is under the general superintendence of W. A. Watson.

Victor, April 21.

The Proper G. M. Co., Cripple Creek, has sold to R. Schwartz the Proper, Occidental, St. Clair and a half interest in the May-Be-So and Chance lodes for $90,000.

J. F. Burns, Pres. Portland mine, says: "We will be forced to close the mine very soon unless we are able to obtain pure water. There is so much lime in that pumped from the mine it has ruined the boilers. The loss to the community will be quite serious. We have a payroll of about $37,000 a month. The property is outputting 1500 tons of $100 ore per month. The ordinary expenses, aside from the payroll, are $25,000 a month."

The Modoc M. Co. will sink a new double-compartment shaft in the center of the Ocean View claim, 5x15 in the clear, to a depth of 1000 feet.

The Van Fleet sampler, near Victor, has been bought under a three-year bond and lease for $30,000 by a company to be incorporated as the Co-operative Sampling Co. by E. M. Lamont, E. W. Ray and S. M. Burtis.

The Milliken lease on the Rattler on Raven hill has been thrown up and the machinery removed.

At the 250-foot level the Winslow Co., leasing the Triumph, Battle mountain, has ore of better grade, 4 feet wide, and an assay giving $640.

Post: Stratton's Independence is outputting from 175 to 200 tons of smelting grade a day. No ore was sent out for seven days. The manager is endeavoring to make the April production equal the average monthly production for the last six months. The average has been about $250,000. Stratton has been paid his $10,000,000 by the English company, and now has nothing to do with the mine.

IDAHO.

ADA COUNTY.

Boise reports that promoters of the Atlanta mining deal have succeeded. It takes in nearly all the mines on Atlanta mountain, including the Petit property, and involves the expenditure of about half a million dollars.

CUSTER COUNTY.

(Special Correspondence).—Herewith I send you a view of the Lucky Boy G. M. Co.'s mill at Custer City (see front page). The mine is located at a point higher up on the mountain, which is connected with the mill by a tramway line 8000 feet long. The company's holdings comprise a group of seventeen claims and is the result of a consolidation of several groups which formerly worked separately. The main workings are through a 600-foot shaft on the Lucky Boy claim. The vein, carrying siliceous, gold and silver-bearing ore, is in syenite-porphyry formation, has an east and west trend and a dip to the north. About fifty tons per day are milled, the proceeds being $15 to $20 per ton, about 65% of which is gold, the balance silver. The process is wet crushing, with copper amalgam plates, Wilfley tables for concentration; also canvas tables and a cyanide plant for the tailings. Some portions of the property have been worked for sixteen years, making a production record of $8,000,000. The stock of the company is held by Messrs. McCormick, Hanauer and N. Treweek of Salt Lake City, the last-named being president and manager. The superintendent is H. A. McCormick. Twenty stamps are now at work, the tailings being cyanided.

Custer City, April 17.

IDAHO COUNTY.

At Pollock, Mgr. Hollingshead of the Utopian M. & M. Co., is operating seven claims, and says he has sufficient gold-copper ore in sight to warrant the placing of a concentrating plant.

OWYHEE COUNTY.

Supt. Jenkins of the Cumberland says the new mill is running satisfactorily. The completion of this mill brings the amount that the company has spent in putting the mine on a working basis up to $100,000.

The Dernier Resort M. Co. has incorporated to operate three claims on War Eagle mountain, near Silver City; capital, $200,000.

SHOSHONE COUNTY.

The Morning M. Co. at Mullan will take water to the mill, where an electric power house is to be put in.

At Wallace, the stockholders of the Sonora M. & M. Co. have declined a proposition to sell the controlling interest in the property of A. B. Campbell on a basis of $35,000 for the entire holdings, and have decided to go ahead and develop the property.

In the Hunter mill at Mullan the ore is brought from the mine on a bucket line, three-quarters of a mile. The buckets carry 250 pounds and bring down ten tons per hour. They are dumped by hand upon grizzlies. The Hunter concentrates are free from zinc. The amount of iron is such that the concentrates sparkle with the cubes of iron which go through attached to pieces of galena. The Hunter concentrates runs 50% lead and sixty to eighty ounces of silver per ton.

WASHINGTON COUNTY.

The Blue Jacket mine is reported shipping copper ore to New York, from a depth of 375 feet, at a profit of $105 per ton.

MICHIGAN.

HOUGHTON COUNTY.

Marquette trimmers of iron ore say if they do not get $3.50 a day a strike will follow. Over 3,000,000 tons of iron ore are to be handled this season.

News Bureau: The sworn statement of the Tamarack M. Co. shows that the company produced in 1898, 19,962,545 pounds of refined copper as the result of an output of 31,127,623 pounds of mineral equal to 63.17%. In 1899 the output of mineral was 31,713,752 pounds, which, at 63.17%, would give a product of 20,033,576 pounds of refined copper. Total receipts in 1899 were $2,952,098. Tamarack's copper was therefore marketed in 1899 for about 14.73c per pound, against 17.15c received by the Atlantic, Quincy and other mines.

News Bureau: At Houghton, the Calumet & Hecla has let a contract for 10,000,000 feet of timber yearly, covering a period of nine years. The excessive heat from the pipes of the steam pump for years past has rotted the timbering in the Calumet branch of the Calumet & Hecla mine. Miners are now driving a crosscut from the Red Jacket shaft to intersect No. 4 at level 51. Three months hence the Calumet branch entire will be unwatered from the Red Jacket shaft. A sump has been sunk at level No. 49, from whence water will be siphoned through the crosscut to the big shaft, thence hoisted to the surface in buckets.

MONTANA.

Montana's metal production for 1899 is figured as follows by the Anaconda Standard:

	Quantity.	Value.
Gold, fine ozs.	238,000	$ 4,919,896 64
Silver, fine ozs.	15,500,000 (Coinage)	20,040,404 04
Copper, fine lbs.	223,000,000	39,471,000 00
Lead, fine lbs.	22,000,000	979,000 00
Total value of production		$65,410,300 68

CASCADE COUNTY.

A. M. Esler has the Crocker, Bull's Head and Josephine groups, in the Swift Current mining district, in the ceded mineral strip of the reservation, and has contracted to develop them and concentrate 1,000,000 tons of ore. He is to pay the actual expenses of mining and is to receive $6 per ton for concentrating, expecting his profits from the payments for concentrating. He will build three concentrators of 200 tons capacity. The ore averages 8% copper and carries a little gold and silver. The nearest railroad station is Blackfoot, 45 miles away.

CHOTEAU COUNTY.

The Alabama mine, at Landusky, has twenty men at work, with milling ore on the dump ready for shipment and 100 tons of ore valued at $50 per ton. The ore will be shipped from Malta.

GRANITE COUNTY.

(Special Correspondence).—The Granite-Bi-Metallic mine was discovered by C. D. McLure, who, while an officer of the Hope M. Co., at Philipsburg, at the request of E. D. Holland, visited the ledge in the summer of 1880 for the purpose of making an examination of it. In doing so, he came across a small piece of float, which, upon careful inspection, had the effect of creating the impression in his mind that this big ledge had merit which lay far beneath the surface, and well did he become convinced of the value of his conclusions by subsequent visits, for he bonded the property in his own name for the sum of $40,000 and took immediate possession. Through him a syndicate was formed, of the following named prominent business men of St. Louis, many of whom are living yet, and heavily interested in the property, viz.: J. R. Lionberger, L. Duestrow, A. B. Ewing, O. B. Filley, S. Gaty, E. Harrison, J. L. January, L. M. Rumsey, M. Rumsey, A. F. Shapleigh, C. Taussig and C. Clark. This organization was effected in December, 1880, two months after Mr. McLure had secured possession of the property, and he became the first manager. At this date there was practically no development upon the property, and the expenditure thereafter made by the syndicate, and up to some

time in the summer of 1883, amounting in the aggregate to some $50,000, was carried along persistently upon intelligent lines, always with sufficient money at hand to accomplish the purposes desired, viz.: the development of the property and the great ledge. The total disbursement in mine purchase and development account at this time was approximately $100,000. J. R. Lionberger was the first president of the Granite Mountain M. Co., he being succeeded in December, 1884, by L. M. Rumsey, the latter continuously occupying the position up to the time of the consolidation in 1898.

The successor of Mr. McLure as superintendent of the property after its incorporation was F. L. Perkins, who, at the time of his acceptance of the position was also acting as superintendent of the Hope M. Co. of St. Louis, a corporation which, under the supervision of P. Deidesheimer, in 1866 built the first silver mill in Montana, at Philipsburg. Mr. Perkins remained in charge of the property until it developed into a bonanza. He was relieved in March, 1885, by J. W. Plummer. The company paid its first dividend, $60,000, in April, 1885. In 1884, Mr. McLure purchased the properties adjoining the property of the Granite Mountain M. Co. Co. on the west, and in July, 1886, incorporated the Bi-Metallic M. Co. C. Clark was the first president of the Bi-Metallic M. Co., and was succeeded by P. A. Fusz in October, 1889, who served as such up to the organization of the Consolidated Co. The members of the boards of directors in these companies being the largest stockholders in both, it was deemed advisable to consolidate them. On April 6, 1898, a charter was obtained under the name of the Granite-Bi-Metallic Consolidated M. Co., and on May 1, 1898, this last company took possession of the combined properties.

Beginning with the year 1883, and up to May 1, 1898, at which time the property was turned over to the Consolidated Co., bullion and ore were shipped as follows:

Granite Mountain M. Co., to the value of	$22,093,106 26
Bi-Metallic M. Co., to the value of	7,267,813 29
Total	$29,360,919 55

The net profits divided among the stockholders during that period amounted to $13,770,000.

The present officers of the company are: P. A. Fusz, Pres.; L. M. Rumsey, First Vice-Pres.; C. D. McLure, Second Vice-Pres.; A. B. Ewing, Treas.; M. Rumsey, Sec.; and W. Ziegler, Supt.

Philipsburg, April 20.

L. U. Loomis has bought the Great Western at Philipsburg and proposes to build a mill.

At Garnet, P. S. Mussigbrod and D. A. Bogart are operating the 10-stamp mill on ore from the Mitchell & Mussigbrod properties.

MADISON COUNTY.

M. W. Alderson is operating the Brother Jonathan mine near Moffat. The pay streak averages 8 inches, but the entire vein matter is treated, which gives an average of $12. The ore is run through a 5-stamp mill and crushed to forty-five mesh; 45% of the values is caught in the plates. The tailings are then treated by an agitating cyanide process.

SILVER BOW COUNTY.

The Standard notes at the upper Anaconda concentrator an improvement in the round tables used for dressing the concentrates. These tables revolve slowly with a steady motion, sloping downward from the center to the outer edge, so as to form a very flat cone. The tailings are run onto the table at the center. Extending from the lower edge of the table to the center, and partially encircling the central point, is a curved flume with two compartments which carries a stream of clear water. These compartments are so arranged that one is a little higher than the other.

The water first enters the upper one, passing through perforations into the lower one, from which it flows over onto the table. As the table revolves carrying its load of tailings, the latter are brought under the trickling stream of water from the flume. This washes the lighter slimes off into a sluice, which is under the edge of the table, whence they are washed away. The heavier concentrates are carried a little farther around, when they are struck by strong jets of water that wash them off into the saving sluice, leaving the table clean and ready to receive a fresh charge of tailings as soon as it gets around to the point of feed. These tables are about 18 feet in diameter. There are twelve of two stories and two single-story ones, making twenty-six table surfaces in all. The flume referred to is new. Formerly the water for dressing the concentrates and washing away the slimes was thrown onto the tables through iron pipes with perforations along their entire length.

The Boston & Montana M. Co. has bought from the original owners a half-interest in the Harris mining claim for $14,000.

NEVADA.

CHURCHILL COUNTY.

The rediscovery of the "lost" tin mine, 20 miles from Wadsworth, is attracting attention. From a sample sent to Swansea, Wales, returns have been received. The ore assays 17%. Five tons will be sent to Swansea to be worked.

ELKO COUNTY.

The Dexter mine at Tuscarora is sinking its shaft 200 feet deeper.

HUMBOLDT COUNTY.

The concentrating plant of the Glasgow & Western Exploration Co. at Golconda has been closed down. The sulphide ores from the lower levels of the mine are now going directly from the crushers to the furnaces. The change is expected to increase the extraction and reduce the cost of treatment.

NYE COUNTY.

At Belmont, Bell & Court have returns from ore shipped to Selby's. The ore worked 300 ounces silver, $43 gold and 25% lead. The returns gave satisfaction.

STOREY COUNTY.

The new Gould & Curry mill at Virginia City is intended to be the best modern crushing and concentrating plant in Nevada. The ore reserves in the Gould & Curry extend upward from the 425 level to the surface. They will be run into the mill in mine cars without sorting. Supt. Kinkead says he will have the mill ready to start as soon as the Floriston company delivers electric power on the lode.

The proceeds of $1869.99, payable to the Con. Cal. & Va. M. Co. for the first two carloads of ore shipped to the Selby Smelting & Lead Co.'s works at Vallejo Junction, out of the total amount of 300 tons to be sent for a test, are net proceeds in gold coin, with all charges deducted, including working charges of $6 per ton and freight at $4.80 per ton. The result shows that the Con. Cal. & Va. Co. has netted $38 per ton on the forty-nine tons contained in the first two carloads. The following items are from the memorandum of settlement:

Bulk weight of ore, 100,800 pounds; tare, moisture 2%, 2016 pounds; net weight, 98,784 pounds.

Contents of 98,784 pounds of ore—Silver $1319.66, gold $1088.60; total value of contents, $2408.26.

Assay per 2000 pounds, silver 47.07 ounces, gold 1.16 ounces.

Yield of the ore—Silver, 2342.88 ounces, less 5%, or 116.24 ounces, 2208.64 ounces at 59¾ cents per ounce, $1319.66; gold 57.295 ounces at $19 per ounce, $1088.60. Total yield $2408.26. Working charges at $6 per 2000 pounds, $296.35. Value of 98,784 pounds of ore (rate per ton $42.76), $2111.91. Freight at $4.80 per 2000 pounds, $241.92. Net proceeds payable to Con. Cal. & Va. M. Co. $1869.99.

NEW MEXICO.

A zinc mine at Organ, twelve miles from Las Cruces, is attracting attention. The mine was opened almost twenty years ago by prospectors looking for silver. Considerable silver ore was taken out, but it ran so much in zinc that it was abandoned. Assays show the ore to run 35% fine.

DONA ANA COUNTY.

When the wagon road is completed to the mines of the New Mexico Lead Co., in the San Andres mountains, the company will put in a 100-ton concentrator. They expect this plant will be in operation by July.

GRANT COUNTY.

The Pinos Altos G. M. Co. is daily taking seventy-five tons of ore out of the Gillet shaft. It is down 800 feet. The mine is lighted with electricity and the ore hoisted to the surface in a double-deck cage by a steam hoist.

The new leacher of the Santa Rita Co. is composed of eight large tanks. The process by which the ore is treated is expected to render profitable ore that runs 3% copper. The low-grade ore will be run through the concentrator and the tailings run through the leaching plant. Sulphuric acid is used to gather the copper from the crushed ore, and it is finally precipitated on iron.

The Colorado Fuel & Iron Co. is shipping from the Fierro district twelve carloads of iron ore per day to Pueblo, Colo. The ore runs about 60% iron, and it is thought there is enough gold in it to pay for transportation and handling, and it is all surface mining. The ore is taken out of the side of a hill, run in small cars to a crusher and from there dumped into the railroad cars.

OREGON.

BAKER COUNTY.

In the 400-level of the Columbia wire gold has been found. Mgr. Baillie will add ten more stamps. He is constructing a cyanide plant to treat the tailings. At present the percentage of values saved varies all the way from 60% to 85%, owing to the character of the ore.

GRANT COUNTY.

The Quebec group of claims, 6 miles from Granite, has been bonded by the Leiters of Chicago. J. C. Campbell is pushing work.

SOUTH DAKOTA.

CUSTER COUNTY.

H. Reinbold & Co. will quarry 500 tons spodumene rock at the Etta mine, near Keystone. They shipped several hundred tons to Europe last year, where it is used for the extraction of lithia. The advertising of this fact, however, led to the discovery of large bodies of other lithia-bearing mineral of better quality and nearer the markets, that it is no longer profitable for this purpose on account of the limited demand for these preparations. It is now used for fertilizing materials.

UTAH.

BEAVER COUNTY.

Lewis Martin goes to Frisco to take charge of operations of the Imperial M. Co. to develop thirty-one claims between the Horn Silver, the Massachusetts group and Cactus, which show ores that afford 12.3% copper, about twenty ounces silver and $4.20 in gold.

CARBON COUNTY.

On the 1st inst. at Scofield occurred a dreadful disaster. Mine No. 4, used as a powder magazine, exploded, with the result that 250 lives were lost—the entire number of miners at work in the mine when the explosion occurred. Miners from other districts came to aid in the search for bodies. The camp is about 100 miles south of Salt Lake City, on a branch of the Rio Grande Western Railway, which leaves the main line at Colton. The mines were operated by the Pleasant Valley Coal Co. of Salt Lake and employed about 700 men. It was the first day shift that was at work when the explosion took place. The cause of the explosion is not known, as no one survives to tell the story. No. 4 and No. 1 mines were connected. The men in No. 1 mine were suffocated; those in No. 4 were burned and mangled.

Up to noon on the 2nd 149 bodies had been brought out. Three hundred and ninety-eight men entered the mine for work on the morning of the 1st, and a great majority of these have perished. The relief force organized into two shifts and the one now in the mine has fifty bodies ready to bring out.

Many of the rescuers came near losing their lives from the fatal after damp, but the work was continued in the face of all danger.

One of the miners sent over from Castle Gate to aid in the rescue work said: "This explosion is the most disastrous, so far as loss of life is concerned, that has ever occurred in America. There will be 250 dead men when we are through work. In the great explosion at Almy, Wyo., a few years ago sixty-seven were killed. We had some hard experiences to-day going through the mine. Several times members of our party were overcome by the damp, but we got them out in time. We found the bodies of the men in every conceivable shape, but generally they were lying on their stomachs, with their arms about their faces. The men died almost instantly when struck by the damp and did not suffer. They just became unconscious and were asphyxiated. Their faces were all calm and peaceful, as though they had just fallen to sleep. The men in No. 1 might possibly have escaped had they started to run as soon as the explosion in No. 4, which is connected with it, occurred. Evidently they did not appreciate this fact until too late, as they put on their coats and arranged their tools before starting. They started, however, just in time to meet the damp half way. The bodies found near the entrance are badly crushed and bruised, as they got the full force of the explosion. They are few in number, however. Mine No. 1 is damaged comparatively little, but No. 4 is badly damaged."

A curious fact is that five men who were working outside of the mine were very severely hurt. One was blown with his horse a distance of 200 yards across the bottom of the canyon. The back of his skull was crushed.

The theory of Mine Supt. Parmeley is that some of the Finns recently imported secretly took giant powder down into the mine to assist them in their work. They were exceedingly anxious to make a good showing and as much money as possible, as it is thought that this form of explosive was used in order that great bodies of coal could be more easily dislodged. It is thought that when the giant powder was touched off it ignited some of the dust, of which every coal mine in the country has more or less.

Inquiry among the miners disclosed the fact that they entertained various opinions regarding the terrible affair, some being exceedingly bitter in their denunciation of the company, and others took a more conservative view of the matter and said it was one of those things over which no man has control, and for which no man or men should be held responsible.

JUAB COUNTY.

The Telluride Power & Transmission Co. will erect an electric plant at Tintic to furnish power for the mines of that district. A separate company will be organized to supply the town with light and contracts have been made with the Sioux-Ajax Tunnel Co. and the Lower Mammoth mine for supplying power.

SALT LAKE COUNTY.

In last week's issue mention was made of the suit of E. W. Genter vs. the Conglomerate M. Co. On the 25th ult. the jury returned a verdict for the plaintiff for $10,830.37, the full amount of his claim and interest. The suit was to recover $10,000 and interest for commission earned by the plaintiff in selling the Old Telegraph mine at Bingham. The Tribune says "the verdict is considered a further emphasizing of the principle that an agent, through whose efforts a sale has been consummated, is entitled to his remuneration, although the final negotiations may have been made direct between the parties."

At Bingham in the Shawmut, chalcopyrite, bornite and covellite have been taken from an ore breast at a depth of 130 feet in the main shaft that are expected to average 40% copper.

TOOELE COUNTY.

The projected consolidation of the Mercur and Golden Gate management is said to be "no go."

The Sacramento, at Mercur, will put in a new roasting plant.

The Sacramento, of Mercur, has sent to Salt Lake City 275 pounds of gold—the second during April. It has been decided to use the furnace now at the Golden Gate. It is said the management of the Golden Gate has succeeded in saving over 90% of the values in the ore.

UTAH COUNTY.

At Provo the Brooklyn Con. M. Co. has incorporated; capital stock, $100,000; Springville, headquarters. The company owns the Sunnyside and Brooklyn lodes at Tintic.

WASHINGTON.

KING COUNTY.

The receipts of the Seattle assay office in January were $139,316.77; February, $132,409; March, $100,359.86; April (three weeks), $33,659.16.

SNOHOMISH COUNTY.

M. J. Willard, foreman at the Carmack mine, Index, says a double shift of men is sinking and drilling. The ore is partly free-milling, decomposed quartz, carrying some silver and copper. A 10-stamp mill and two concentrators are talked of.

At Darrington the Park & Johnson M. Co. have bought the Forest mine for $15,000.

STEVENS COUNTY.

The Le Roi, B. C., is sending 3000 tons ore per month to the smelter at Northport. Notwithstanding this it will not start up till June 1. The ore will have to be roasted and the management desires to have a large surplus on hand.

The Silver Butte M. & S. Co. has organized at Northport, and has bought the Silver Butte and Silver Star claims for $100,000. They say they will put in machinery which will enable them to daily ship three carloads of ore to Great Falls, Montana. The previous owners recently shipped four carloads, which netted them $2500 on the cars a Northport. The ore runs 60% lead in addition to some silver values.

FOREIGN.

BRITISH COLUMBIA.

American miners are going into Atlin.

J. P. Graves, of the Granby smelter at Grand Forks, says it is practically completed; he has 100 acres of lime rock on the North Fork about two miles above the smelter, on the main line of the railroad; will use Crow's Nest coke; has a sawmill capacity of 26,000 feet daily; built the smelter for mines and expects to have all the ore they need at their own mines. If they need any additional ore for fluxing they will buy it. He wants specifications for a central compressor plant to operate the mills at Phœnix, which will have a capacity at sea level of fifty odd drills, or at the elevation of the mines, 4800 feet, of forty drills, to operate the Old Ironsides, Knob Hill, the Granby Smelting Co.'s group of four claims—the Victoria, Etna,

Phœnix and Fourth of July—and the four claims of the Grey Eagle Co.

The following is a list given by the Ymir Miner of the mines working within 10 miles of Ymir, with the number of men employed :

Mines.	No. of men.
Ymir	145
Roanoke	8
Wilcox	4
Rainy Day	6
Dundee	5
Big Horn	10
Union Jack	3
Arlington	42
Erie Con	5
Second Relief	35
Susquehanna	8
Tamarac	12
Blackcock	10
Good Hope	11
Dominion	3
Nevada	8
Elorado	3
Hillside	6
Yellowstone	40
Canadian King	40
Leo	6
Katie D. Green	8
Other claims	20
Total	438

The Cascade Power & Light Co. is developing 12,500 H. P. at the falls in the Kettle river at Cascade, twelve miles from Grand Forks. The dam is built near the head of the Cascade gorge, and is 400 feet long and 40 feet at the base. The flume will be 2700 feet long.

At a recent London meeting of the shareholders of the Hall mines it was decided to reorganize the company on the basis of a fresh assessment of 5s per share.

J. Russell, from Atlin, reports a strike on Spruce creek on claim 90, below discovery, of free-milling gold quartz 4 feet wide.

The London Con. G. F. E. & M. Co., owns the Silver Hill, Norfolk, Simcoe, Green Crown S. & N., and Roy fraction, on Canyon creek, a tributary of Crawford creek, 12 miles east of Pilot bay. The property has been developed by 3000 feet of tunnels, drifts and crosscuts. In one of the tunnels, 800 feet from its mouth, a shoot of gray copper ore has been found.

Some time ago Carl Kleinschmidt & Christie bought the Georgia group of copper mines, eight claims on Texada island, 50 miles north of Vancouver. The company owns a smelter there. The Georgia mines are producing about 100 tons a week, carrying 14% copper and $8 in gold. Kleinschmidt says he will build a smelter there. He is now in Butte, Montana.

Supt. Parker of the North Star says he is shipping to Great Falls, Mont., about seventy-five tons per day. The ore averages about $62 per ton. It is a silver-lead ore averaging 55% lead, and the balance of the values in silver. The mine is paying a profit. The values given are figured by the old method, where the duty of 1½ cent per pound on the lead was paid; but according to the new method in vogue, whereby no duty is paid, but where the price of lead is fixed by the London market, the values would be less. The wage scale was recently raised by the North Star, and is the same as in the Slocan. The Sullivan, 4 miles from the North Star, is being developed by the old Le Roi people. The St. Eugene mine is employing 250 men in the vicinity of Moyie. A 100-ton concentrator has been built.

The North Star, East Kootenay, is shipping to Great Falls, Mont., about seventy-five tons per day. The ore averages about $62 to the ton. It is a silver-lead ore, averaging 55% lead and the balance of the values in silver.

At Rossland the contract system is meeting with favor among the men. Good miners at work on the Columbia-Kootenay, Josie and No. 1 mines are applying for contracts in the Le Roi mine. Three drills on contract have started on the War Eagle mine. The ordinary day's wages, it is stated, were passed, and, if the present rate is kept up for thirty days of the contract, the takers calculate to make well over $120 apiece. Two shifts are working, the muckers removing the loosened rock during the continuance of the work, and blasting is done on the odd shift. There are about fifty men engaged.

COREA.

J. Sloat Fassett has returned from Corea, where he has a mining concession of 400 square miles. He says he can ship a ton of freight from New York to the mines near the Yaloo river as cheaply as the same ton can be sent to the mountains of Idaho, and about as quickly, too. His lease has twenty-five years to run. He has the right to mine any mineral, but has confined his attention to gold alone. All of his machinery is of American manufacture, as this country makes the best machinery for mining purposes in the world. He employs seventy-five white men and 3000 coolies. There are many good fields in Corea, as the country possesses a continuation of the gold-bearing outcrops of Siberia and Manchuria, both of which are bound to be great gold producers. The Coreans have been mining with crude methods for many centuries, and they are still at it.

MEXICO.

The Somara mine of El Oro, sold to the El Oro Mining & Railroad Co., Ltd., of London, is reported to have brought $2,500,000. The shaft is sunk about 700 feet. C. D. Lane is a holder of a block of the stock. P. L. Foster is Gen. Mgr.

RUSSIA.

The Berliner Tageblatt hears from St. Petersburg that the Englishmen who were authorized to prospect for gold near the eastern coast of Siberia, on the shores of the sea of Okhotsk, have discovered immensely rich strata, described as "a second Klondike." Col. Osborne is said to have gone to St. Petersburg to ask for a concession for exploiting the gold field. The Russian Government seems disinclined to grant any concession to foreigners.

SOUTH AFRICA.

Reuter reports that holes have been bored in a number of mines at Johannesburg preparatory to their destruction by dynamite. The mines in question include the Langlaagte Estate, the Robinson and the Paarl Central. Holes are also being rapidly bored in the deep level mines. The Boers are said to be determined to destroy the mines out of revenge in the event of their ultimate defeat. All British subjects and Americans and a large proportion of Germans are to be sent across the border.

THE KLONDIKE.

In February, '98, L. Patnaud resigned as postmaster of Everett, Wash., to go to the Klondike. Three of his friends made up $400 as a grubstake. No word came from him until he returned to Everett on the 10th ult., when he divided $10,000 among the three who had staked him.

Dawson reports a stampede up White river, which empties into the Yukon from the west, 12 miles above Stewart, which is deserted. Bedrock is from 8 to 12 feet, and the pay on discovery claim averages about 2 feet thick and of unbroken width. The gold is coarse and runs from 10 to 50 cents to the pan.

Sixty Yukon steamers between Bennett and St. Michael are being placed in readiness for the Yukon. The break-up of the Yukon above Dawson is expected about May 5th. It will find all navigation companies prepared for business, for both supplies and men have been pouring through Skaguay for a month.

Industrial Notes.

—On the 2nd inst. the House of Representatives passed the Nicaragua canal bill by a vote of 225 to 35.

—A railroad 220 miles long is to be built from Great Falls, Mont., where the Boston & Montana and other smelting plants are, to Billings, to connect with the C., B. & Q. Ry.

—San Francisco foundrymen are scouring eastern and northern Nevada for scrap iron, and machinery once costing hundreds of thousands of dollars is shipped as junk to be remelted.

—Machine shops and iron working tools are wanted by the Cohahuila & Zacatecas Railway of Saltillo, Mexico, which proposes to spend $500,000 in building machine shops with modern equipment.

—The American-Mexican Railway Co. has incorporated at Tucson, Arizona, to construct a road thence to Phœnix and from Tucson to St. George's bay, on the Gulf of California, 200 miles south.

—Vladivostok, Russia, will build twenty miles of electric trolley road, an electric light plant and water works. Consul Greener says there is opportunity for American contractors to secure some of the work.

Personal.

A. O'DONNEL has been appointed Supt. Conjecture mine, Hope, Idaho.

F. E. WILSON has been appointed Supt. Bunker Hill mine, Stockton, Utah.

SAMUEL ROBBINS of Eureka, Utah, is Supt. G. M. M. Co., Glendale, Mont.

J. H. HAMMOND is examining mining property in San Juan county, Colo.

W. H. WICKHAM has gone to Ely, Nev., to take charge of the Chainman mill.

HARRINGTON BLAUVELT is Supt. Cast mine, near the Hassayampa, Arizona.

THEO. F. VAN WAGENEN is examining dredging ground near Yuma, Arizona.

H. C. KINGSBURY succeeds Mgr. Garrigues at the Golden Zone, Loomis, Wash.

H. S. SANFORD is operating the Shorty Hope mine and mill at Ashland, Oregon.

SMILEY S. JONES is Supt. Empire M. Co. mill and mine, Groom creek, Arizona.

E. MCCORNICK, late of Wardner, Idaho, is now Supt. Vulcan C. M. & S. Co., Sodaville, Nev.

RICHARD A. PARKER of the U. S. M. Co., Utah, is examining California gold properties.

DANIEL DWYER, formerly Supt. Helvetia, Pima county, Arizona, has gone to San Marcial, Mexico.

CLARENCE E. KING has gone from Butte, Montana, to N. Y. City, preparatory to returning to the Klondike.

W. S. KEYES, Pres. Cal. State Mining Bureau, has returned to San Francisco from giving expert testimony at Butte, Montana.

GEO. B. ERNSHAW, Supt. Shawmut mine, Bingham, Utah, has gone to Tuscarora, Nev., to start up the new Young America mill.

H. W. FLETCHER AND S. H. HASSELMAN, formerly of the Iron Chief mine, Riverside county, Cal., left on the 1st inst. for Cape Nome.

CHAS. GRACEY AND A. W. VANDERCOOK of El Dorado Canyon, Nev., are in San Francisco to get a cyanide plant and other equipment for the mine there.

JAS. TAIT of Lincoln, Placer Co., Cal., will superintend erection of machinery in the Resurrection hydraulic mine, on Resurrection creek, Cook's Inlet, Alaska.

JNO. ANDREWS, long-time foreman at the Copper Queen, Arizona, will have charge for Ben and Lewis Williams at their new field of operations near Milton, Cal.

W. F. CODY, "Buffalo Bill," is now engineering a project to build a smelter in Wyoming, where twenty-five years ago he helped chase Sitting Bull and his band of hostile Indians.

A Good Recommendation.

MICHIGAN BLUFF P. O., CAL., Feb. 6th, 1900.

ERICSSON TELEPHONE CO., NEW YORK CITY—GENTLEMEN: We are in receipt of your letter of the 31st ult., asking if your telephones have given satisfactory service. Replying, will state we have in the last six months purchased of you four Ericsson wall telephones, with adjustable arm, and one Ericsson's Swedish desk set. These are in use on the local telephone line. They are giving excellent service, and we can confidently recommend them to those who require a telephone "that talks," either for short or long distance work. Their title of standard of the world is well earned. Yours very truly,

HIDDEN TREASURE GRAVEL M. CO.
By HAROLD T. POWER, Supt.

Since writing as above Mr. Power has sent another order. The Ericsson Telephone Co. have arranged with the Electrical Railway & Manufacturers' Supply Co., 548 Mission street, San Francisco, to handle their goods, and they will give prompt attention to all inquiries.

Catalogues Received.

GENERAL CATALOGUE GATES IRON WORKS, 650 Elston Ave., Chicago: While this concern issues several catalogues of specialties, it has concluded in this instance to furnish a compendium of illustrated description of mining machinery, and in this 238-page work supplies a more than ordinarily interesting and instructive mass of information concerning all classes of mining machinery, admirably arranged and profusely illustrated. With proper understanding of its value, the Gates Iron Works has copyrighted the entire contents. The book will be delivered upon request addressed to the Chicago house, or the California representative, the American Manufacturer's Association, 20–22 Fremont St., San Francisco.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING APRIL 24, 1900.

648,187.—HOSE COUPLING—J. E. Bright, Los Angeles, Cal.

648,004.—WINDOW SHADE CUTTER—W. T. Van Dercar, Pasadena, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MEANS FOR CHARGING LEACHING VATS.—No. 647,678; April 17, 1900. C. W. Merrill, Alameda, Cal. This invention relates to a method of charging ore or tailings to a leaching vat, which process is a step in the treatment of said ore or tailings preliminary to the application of the solvent soultion in cyanide, hyposulphite, or other hydrometallurgical processes. It consists of a tank or like inclosure, an inclined chute located above the inclosure and mechanism by which it is revolved about a vertical center, said chute having the bottom and vertical sides connected by concaved curved plates, openings made in the bottom of said chute at intervals between the upper and lower end transversely and longitudinally movable gates or valves whereby the positions of the openings may be varied longitudinally or from side to side and the area of discharge regulated.

DOOR CONTROLLER.—No. 647,671; April 17, 1900. M. A. De Lew, of Sacramento, Cal. One-half assigned to W. P. Coleman, of same place. This invention relates to a device which is especially designed to open or close doors of any description, either from points closely adjacent to the door or from a distance. It is especially adapted for the opening of heavy safe, vault, and other doors which are difficult to move, the opening of doors or gates upon railroad trains, steamboats or elevators, and in residences, and for opening and closing street doors from floors above or from points at a distance from the doors, and generally for controlling all means for ingress and egress of a like nature. It consists of a vertically hinged door, a shaft projecting from one end in line with the hinges and having a rocker arm fixed thereto, a cylinder fulcrumed at one end, a piston movable therein and a piston rod connecting with the rocker arm, ports or passages by which liquid under pressure is admitted to opposite ends of the cylinder, pipes connecting said ports with a valve chamber, a valve movable in said chamber having ports therethrough adapted to connect with the supply and discharge passages of the cylinder, a pipe by which liquid under pressure is admitted to one end of the valve chamber, a supplemental valve, controlling ports by which liquid is admitted to and exhausted from one end of the main valve chamber, electrically actuated solenoids and a lever connection between them and the supplemental valve stem whereby the latter is moved to admit liquid to the main valve, and a spring by which both valves are returned to their normal position when the electric circuit is cut off.

This Paper Fifty-Two Times, POST PAID, $3.00

Latest Market Reports.

SAN FRANCISCO, May 3, 1900.

SILVER—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 60c (1000 fine); San Francisco, 60c; Mexican dollars, 49c.

LOCOMOTIVE WANTED FOR CASH.

One 36-in. Gage, Saddle Tank preferred.

Cylinder about 9-in. diameter by 14-in. stroke, or larger.

Also, ONE STEAM SHOVEL.

Would consider purchasing Little Giant Traction.

In replying, send full specifications, including age, present condition, location and lowest cash price. Address CONTRACTOR, 1603 Monadnock Block, Chicago.

Atlin Gold Fields,
British Columbia.

Of particular interest to HYDRAULIC OPERATORS and experienced QUARTZ PROSPECTORS.

American miners can pre-empt claims.

For further particulars write

BROWNLEE & LOWRY,

Civil and Hydraulic Engineers and Land Surveyors,

Atlin, British Columbia.

SITUATIONS WANTED.

ASSAYER, ANALYTICAL CHEMIST AND SURVEYOR,
with considerable experience in silver-plating mill plates, desires position. Best of reference furnished. Address A. B. C., this office.

WANTED, POSITION AS SUPERINTENDENT.
Thorough mining and mill man, assayer, accountant and business man. Twenty-five years' experience. References. Address T., this office.

FOR SALE.

NEW AND RICH GOLD MINES FOR SALE. Large vein (150 feet) opened; assays from $1 to $100 and over. Twelve miles from C. P. R. R. Samples sent, or copies of 100 assays. Investigation challenged. B. F. WILSON, Galena, Nevada.

Gold Placer Ground (U. S. Patent) in Western States.—The owners of a well-tested property of about 400 acres, suitable for working by dredging, being unable to work same themselves, invite full investigation with a view to sale of the whole or an interest. Reply K. B. C., Mining and Scientific Press.

For Sale—Complete Gasoline Assay Outfit.
Brun combination furnace, gold balance, etc Very little used. Address 2119 Kittredge St., Berkeley, Cal.

FOR SALE—NEW BRUCKNER ROASTER.
size 27 ft. by 8 ft. 6 in. Knock down for immediate delivery. Feed hoppers. Address "Roaster," care Mining and Scientific Press, San Francisco.

A WATER-JACKETED PYRITIC MATTE SMELTER, Fifty Tons Daily Capacity, Second Hand, in Use Two and a Half Months, FOR SALE CHEAP. Address HOWARD CHEMICAL WORKS, St. Louis, Mo.

WANTED.
A Developed Copper Property.
A specialty made of developed properties in Mexico and the Southwest. Good mines and prospects are wanted. Bona fide correspondence of mine owners, capitalists and investors solicited.
H. E. RUNKLE, Mining Broker, El Paso, Texas.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery. For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Staloknecht, Durango, Mexico.

10-Stamp Mill For Sale.

Ready for immediate shipment, one 10-stamp mill (stamps 1000 pounds each), including camshaft pulley, line shaft and pulley, two Challenge ore feeders, oak stem guides, two sets 52-in. x 16-ft. heavy copper plates. A BARGAIN.
Address "Stamp Mill,"
P. O. BOX P, AUBURN, CAL.

FOR SALE.
Mine and Mill Now Running.
Will sell part or whole, for cash or on bond. Plenty $10 to $35 rock in sight. Everything straight and bona fide. Disagreement of partners. Full examination invited. Principals only. Address J. G., this office.

A BARGAIN.
3500 feet of 16-inch, 5 B. W. G. National Tube Works seamless pipe. Kimberly joints. Immediate delivery.
Address PIPI, Room No. 140, No. 32 Broadway, New York City.

STEEL RAILS FOR SALE.
300 tons 30-lb. Relaying T Rails; 40 tons 25-lb. Relaying T Rails; 30 tons 20-lb. Relaying T Rails; 10 tons 12 and 16-lb. New T Rails. 1 Porter Saddle Tank, narrow gauge. Correspondence solicited.
C. J. TALLON,
308 Market Street, San Francisco, Cal.

FOR SALE--$6000.
A GOLD MINE.
Ledge averages 3 feet. True fissure in granite. Values $1.50 to $16 per ton. Equipped with 5-stamp mill. Water power, good buildings, fine timber. Easy of access. Splendid opportunity for three or four miners who will do their own mining and milling. Satisfactory reasons given for selling, and rigid investigation desired. Address E. H. B., care of Mining and Scientific Press.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long established, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

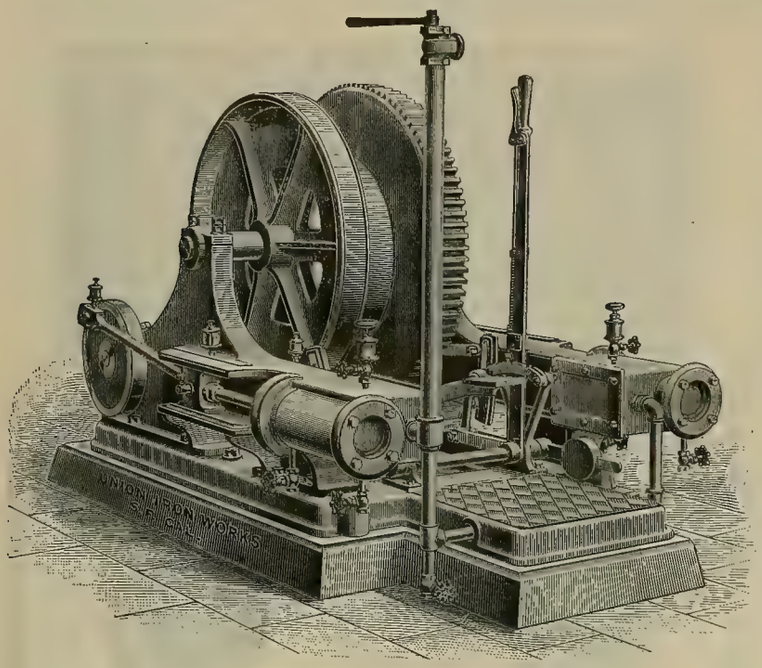
McCARTHY & MACKAY, Selling Agents,
226 MARKET STREET, SAN FRANCISCO, CAL.

For Testing Placer Ground.
Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes. Unexcelled for lead and zinc testing.
KEYSTONE DRILLER CO., Beaver Falls, Pa.



SMOOTH-ON CASTINGS.
TRADE MARK.
An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

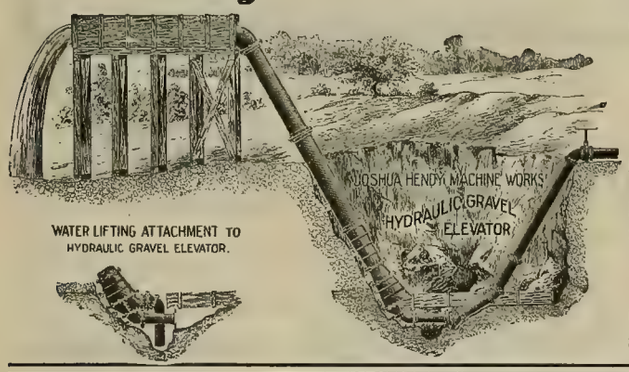
HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.



The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

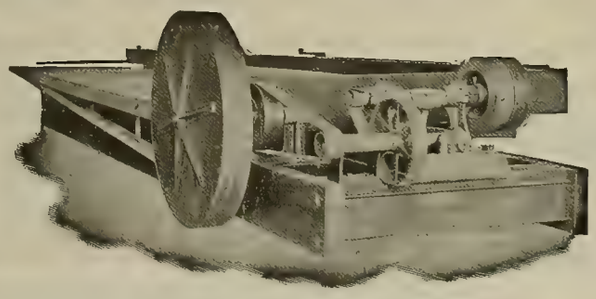
SPECIAL DEPARTMENT OF

Hydraulic Mining Machinery,

Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us.



The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestibly superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

Over 2000 in Use.

KEPT IN STOCK READY FOR SHIPMENT.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

THE WILFLEY CONCENTRATORS HAVE LARGE CAPACITY, EASY ADJUSTMENT, ARE SIMPLE IN CONSTRUCTION, AND NOT LIABLE TO WEAR.

WHITE, ROGERS & CO.,

RISDON IRON WORKS,

SAN FRANCISCO, CALIFORNIA.

Cable: "Risdon's." Code: A. B. C. & Leiber's.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

RIVETED STEEL WATER PIPE

RISDON IRON WORKS MANUFACTURERS BEALE & HOWARD STS. SAN FRANCISCO, CAL.

All sizes of Steel Water Pipe for City and Town Supply, Placer, Hydraulic and Quartz Mining. Cut, punched and rolled to be riveted at destination or made up complete.

We make a specialty of all kinds of Heavy Sheet Iron and Steel Work. Plans and Estimates furnished.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

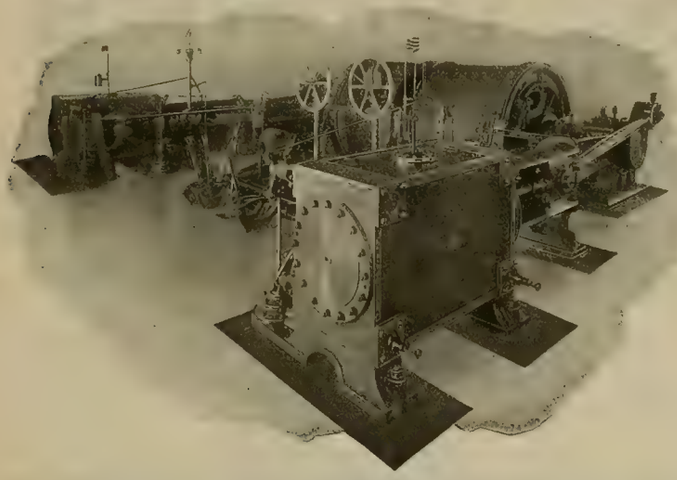
CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.



The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

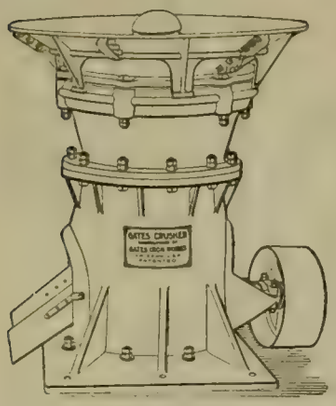
Schaw, Ingram, Batcher & Co., 539 Mission St., SAN FRANCISCO. 211 to 219 J St., SACRAMENTO.

THE BLAZED PATH

IS A GOOD ONE TO FOLLOW.



The money-making manufacturers advertise in this paper with most successful results. Results are what count.

You can buy advertising space for less money elsewhere, but you can't buy a CHEAPER advertisement. Cheapness is not regulated by what you pay, but by what you get for what you pay.

In the MINING AND SCIENTIFIC PRESS you reach over 30,000 probable customers fifty-two times a year.

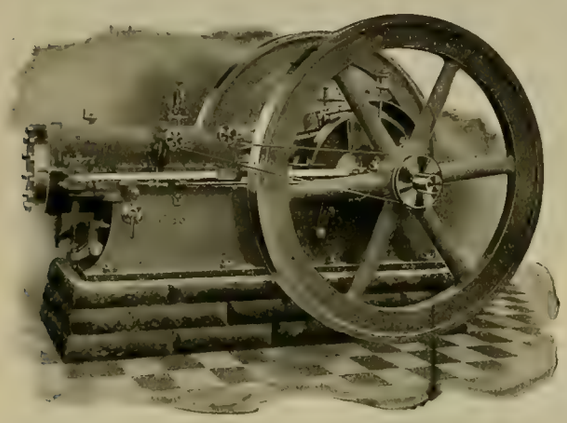
330 MARKET ST., SAN FRANCISCO, CAL.

GATES IRON WORKS.

The Original GYRATORY BREAKER.

It is ADJUSTABLE, and INDESTRUCTIBLE.

THERE ARE 4,000 OF THEM IN USE.



The South African Mines Have Purchased 200.

. . We build a FINE CRUSHER that is a wonder. . We know how to design this class of machinery. . . . There are others who think they know how to make a Gyratory Crusher; they are simply poor imitators of The Only Great Gates Rock and Ore Breaker. .

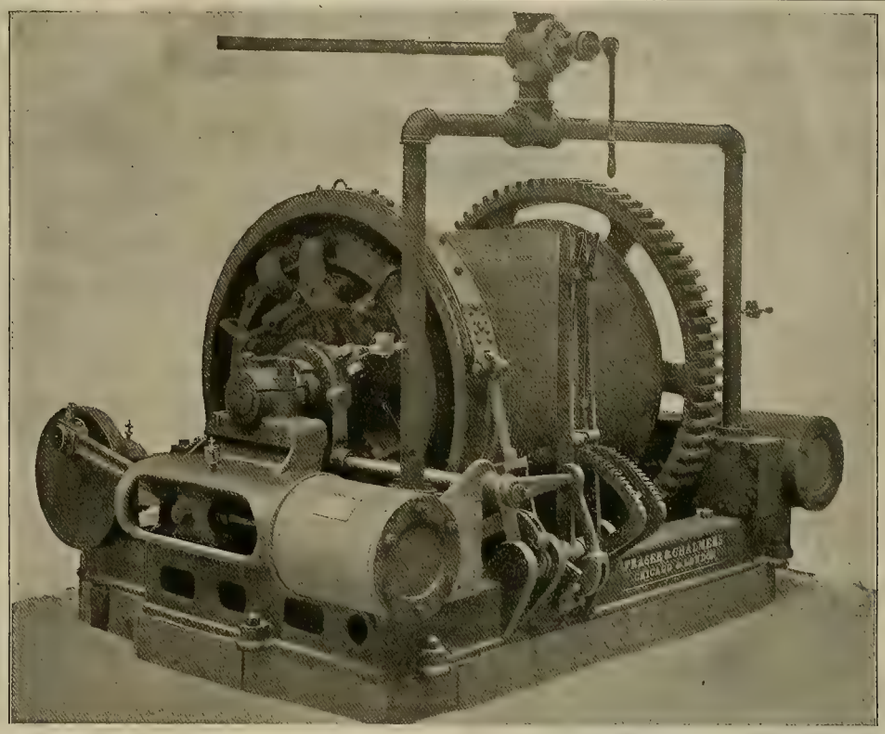
NO MORE PACKING DIRT TO WATER.
—THE—
PNEUMATIC PROSPECTOR.
Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.



NO WATER NEEDED.
Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.
Weight 160 lbs.
Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

THE LITTLE ALASKA GOLD WASHER.

Price $6. Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

AARON'S ASSAYING, PART I.

FOURTH EDITION.

Revised, Rewritten, New, Improved.

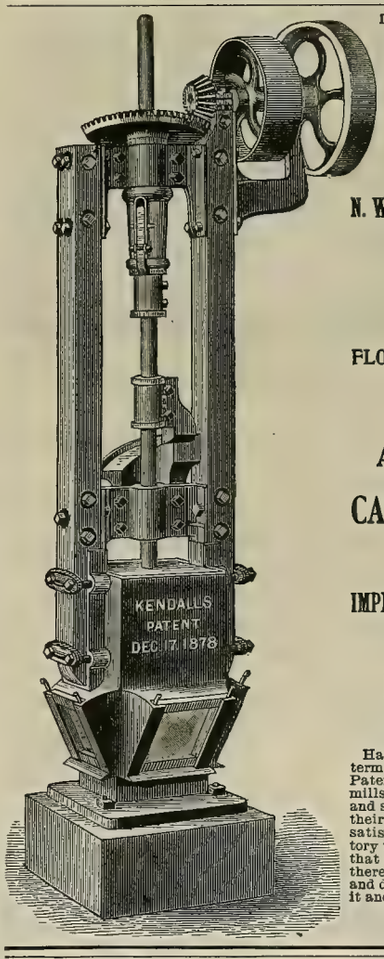
This practical treatise on assaying has long been the favorite among practical men. The new edition, just out, is up to date. Price $1, postpaid anywhere.

Book Dept., Mining and Scientific Press,
330 MARKET ST., SAN FRANCISCO, CAL.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

THE UNION GAS ENGINE CO.

—BUILD THE—



"Union" Gas Engines,

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

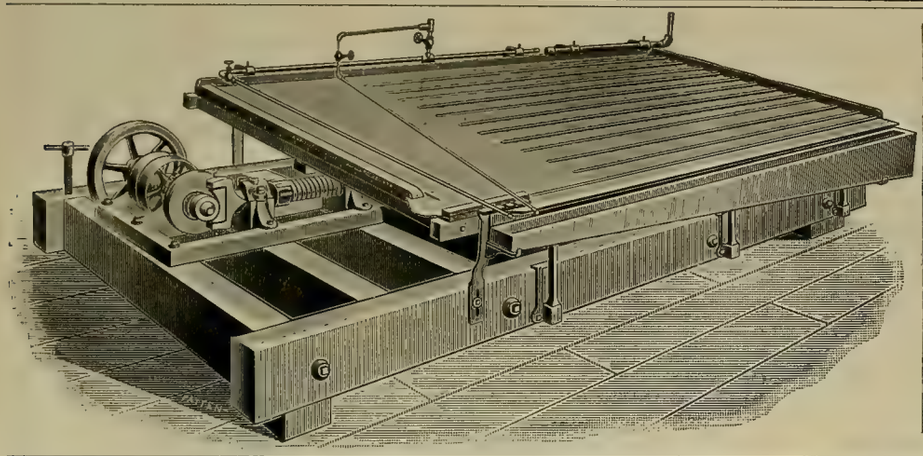
MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. **50 Cents a Copy.**

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.



THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. | SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. | CAPACITY FROM 5 TO 10 STAMPS.

No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

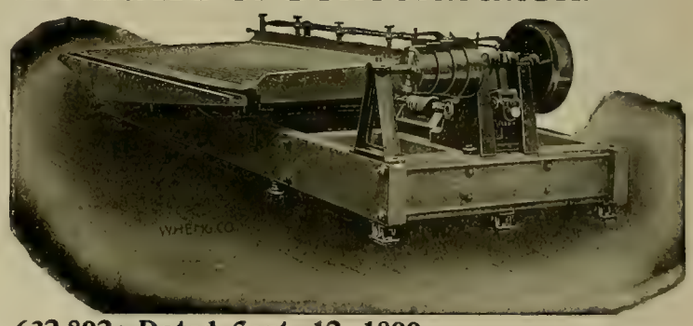
Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, mroe or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.



(SEE PAGE 509.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Wilson's Practical Tool Maker and Designer.

THE PRACTICAL TOOL MAKER AND DESIGNER: A treatise upon the Designing of Tools and Fixtures for Machine Tools and Metal Working Machinery, Comprising Modern Examples of Machines with Fundamental Designs for Tools for the Actual Production of the work; Together with Special Reference to a Set of Tools for Machining the Various Parts of a Bicycle. Illustrated by 189 engravings; 8vo. Price.....$2.50

CONTENTS.—Introductory. Chapter I. Modern Tool Room and Equipment. II. Files, Their Use and Abuse. III. Steel and Tempering. IV. Making Jigs. V. Milling Machine Fixtures. VI. Tools and Fixtures for Screw Machine. VII. Broaching. VIII. Punches and Dies for Cutting and Drop Press. IX. Tools for Hollow-Ware. X. Embossing; Metal, Coin, and Stamped Sheet-Metal Ornaments. XI. Drop Forgings. XII. Solid Drawn Shells or Ferrules; Cupping or Cutting, and Drawing; Breaking Down Shells. XIII. Annealing, Pickling and Cleaning. XIV. Tools for Draw Bench. XV. Cutting and Assembling Pieces by Means of Ratchet Dial Plates at One Operation. XVI. The Header. XVII. Tools for Fox Lathe. XVIII. Suggestions for a Set of Tools for Machining the Various Parts of a Bicycle. XIX. The Plater's Dynamo. XX. Conclusion—With a Few Random Ideas. Appendix, Index.

Price $2.50, free of postage to any address in the world.

☞ *A Circular of 4 pages quarto, giving the full Table of Contents of this important book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish us with his address.*

☞ *Our New and Enlarged Catalogue of Practical and Scientific Books, 92 pages, 8vo., a New Catalogue of Books on Steam, the Steam Engine, etc., and our other Catalogues the whole covering every branch of Science applied to the Arts, sent free and free of postage to anyone in any part of the world who will furnish us with his address.*

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of April, 1900, an assessment (No. 28) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of May, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 28th day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOYONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of April, 1900, an assessment (No. 70) of fifteen (15c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 31st day of May, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of April, 1900, an assessment (No. 16) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of June, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of April, 1900, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of June, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 25th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HELD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

ANNUAL MEETING OF STOCKHOLDERS.

In accordance with the by-laws of that company, the Regular Annual Meeting of the Stockholders of the Jamison Mining Company will be held at the office of the company, Room 54, 120 Sutter St., San Francisco, California, on Monday, the 21st day of May, 1900, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, the 19th day of May, 1900, at 12 o'clock M. and open again at 10 o'clock A. M. on Tuesday, the 22nd day of May, 1900.

SAM. W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, 120 Sutter St., San Francisco, California.

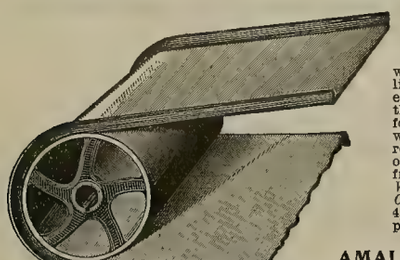
THE
Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.



Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Up-to-date Miners who value their lives use McINTYRE'S DRY BATTERY

NO. 2 LAMP.

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored, where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

No. 2077.—VOLUME LXXX. Number 19. SAN FRANCISCO, SATURDAY, MAY 12, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

This Paper not to be taken from the Library.

Removal of Rocks in San Francisco Harbor.

In the Bay of San Francisco, Cal., almost in front of Golden Gate and near Alcatraz Island, were three rocks which have been a source of danger and a constant menace to navigation in foggy weather, especially, on account of the strong tides and swift currents in that vicinity. On Sept. 14th, 1899, a contract was made by the U. S. Government with Rudolf Axman of Los Angeles, Cal., for the removal of these obstructions, for $253,000. For this amount the contractors agreed to remove Arch rock, containing 25,152 cubic yards; Shag rock No. 2 (entirely submerged), containing 2979 cubic yards, and Shag rock No. 1, containing 3800 cubic yards, all of which were almost wholly under water (see accompanying engravings). The specifications called for the removal of 1000 yards per month, and to a grade plane 30 feet below the mean of the lower low waters. The work is in charge of Lieut.-Colonel Heuer, Corps of Engineers, U. S. A., with H. L. Demeritt in local charge.

Shag rock No. 1, upon which operations were begun, was 25 feet in diameter at low water mark, and 10 feet in elevation. At the 30-foot contour it was oval in shape, the extreme length being 145 feet and the width 110 feet. It was composed of metamorphic sandstone, stratified, hard and soft. Work was supposed to begin on Dec. 1st, 1899, and drilling was commenced Feb. 1st, 1900, with 3¾-inch bits. Ten holes of that diameter were started, but, except one, could not be maintained on account of choking. On March 1st drilling was started with 10-inch bits, and after March 9th was carried on almost continuously until completion on April 24th. Twenty-four 10-inch holes, at an average distance of 15 feet apart, were bored into the rock from 9 to 38½ feet deep, making a total depth of 518.6 feet. These holes extended from 3½ to 7 feet, or a total of 120.4 feet below grade, and were cased downwards from 5 to 10 feet with double well casing.

Three percussion steam and one drop drill were tried with I, S and SS bits, but the drop drill and S and SS bits were abandoned. A depth of from 2 to 10½ feet was drilled per day of eight hours. Steam to operate the drills was conveyed, from a boiler on board a scow moored alongside, through a 3-inch pipe furnished with self-adjustable ball and socket joints. The holes were kept clear by use of duplex pumps with 1½-inch jets.

A swinging table, or platform, was built, from

WHAT brings money is a knowledge of how to do things and the ability to do them. It makes little difference how this knowledge or ability is acquired. It is, however, often easier and quicker to get some of it in technical schools than entirely through manual training. Probably the best place to learn the "how" is in the technical school, and the best place to get the ability and practical judgment is in the mine.

IT was supposed that all the "cyanide patent" litigation had ceased, but a case is now on trial where J. R. DeLamar is suing the DeLamar Mines Co., Ltd., of Idaho, for alleged infringement of patent. Plaintiff asserts defendant has illegally used what is known as the "Waldstein Process," which employs zinc dust instead of zinc shavings in the precipitation of the gold solution, and claims $300,000. Defendant asserts that such use of zinc dust was not new, nor a "discovery," as considered by the patent office. The fact, however, that the U. S. Patent Office issued a patent therefor will be a hard one to get around.

THE official figures of California's '99 gold yield by counties, published on the 21st ult., give a noticeably low percentage of silver. The figures were $15,336,031 gold and $504,012 silver. According to that, there is but 3% silver in California gold, though it is to be assumed that, as elsewhere, the proportion of silver is 10%. Taking this figure would give $1,584,000 silver, instead of $504,012—a discrepancy of about $1,000,000. It is probable that Statistician Yale's figures are correct as to his official returns, and that the difference lies in a million dollars in silver lost. These figures would indicate that, in California, not more than 33⅓% of the silver contained in the ores is saved—an uncomplimentary conclusion.

EVERY PAPER received at this office has the names of miners going to Cape Nome. The coast cities are alive with men thronging to the newest El Dorado. A few have arrangements that justify hopes of success; other few control capital to go into extensive enterprises, but the majority are mostly "taking chances," and are buoyed by hope that they may be among the lucky ones. 'Tis a dreadful lottery, in which the blanks mean disappointment, and, often, death, and it is a pity that so much energy and treasure should be flung away when one-tenth of it would develop better results in a better country. The hegira shows two facts: that those going do not believe this assertion, and the perpetual charm of novelty. The chief attraction to that region is that it is "a new country," and fancy fills the rest. One fortunate thing is that it will be easier to get back than it was from the Klondike three years ago, and the consequent aggregate of suffering and loss will be less.

A General Land Office Ruling.

Decisions from the Secretary of the Interior and rulings from the General Land Office of importance to miners are frequent, and their continued notice is necessary to those who would keep informed. The latest reverses all previous rulings of the Land Office since '84, and is of particular interest to the holders of unpatented mining ground. Summarized, the case is as follows:

In Cripple Creek district, Colorado, on Carbonate hill, the Carbonate Hill Company owned and patented the Hustler and New Year claims adjoining. The westerly end center of the Hustler claim was located within other ground owned and patented by the Fort Wilcox Co. By "end center" is meant the central point on the end line of a claim located 150 feet from either corner stake. The Washington authorities rule that the end center may be located either within ground already patented or not patented, as it may happen to be.

The westerly end line of the Hustler joined the side line of the New Year, and if a new survey was to be made the old locators of the Hustler would have to go up the hill 600 feet farther in order to establish an end line, the center of which should be clear of the Ft. Wilcox ground. The Carbonate Hill Company had done $1000 worth of development work for the two claims and $800 of it was performed on the New Year. If the Hustler claim had to be relocated at a point 600 feet distant from the New Year, then the extra patent work done on the New Year would be wasted and the Hustler would have to be patented all over again, as the two claims were no longer "contiguous."

The receivers' receipts for the Hustler and New Year were cancelled in so far as they applied to the Hustler and allowed to stand for the New Year, being one of the few instances where receivers' receipts have been cancelled by the Government. The Carbonate Hill Company took the contest to the General Land Office, claiming that they had a right to patent under the original survey, also that the New Year and Hustler were located contiguous and the patent work done on the New Year was for the benefit of both claims, and that the fact that the end center of the Hustler fell within the territory located and patented by the Ft. Wilcox counted nothing against the Hustler location. The Carbonate Hill Company based its contention for the latter point upon a decision of the United States Supreme Court in the famous case of the Del Monte and Last Chance lodes, claiming that it was a directly parallel case. In this latter case the end center of the claim was being patented within territory that had already been patented to another company, but this did not make it necessary for a re-survey and location. The General Land Office rules in favor of the Hustler, and thereby allows the end line located within the Ft. Wilcox to stand; the patent work done on the New Year, which is still contiguous territory, will apply on the Hustler and no new location is needed. The decision gives the Carbonate Hill Company a chance on all apex questions which may arise in the future on all veins which are found to pass through both end lines of the Hustler.

MUCH stress is laid in an Eastern journal on the probability of unusual profits in Japanese and Corean mining investments because of the "cheap labor" procurable. Without discussing the likelihood of profit in working those mines—a matter that depends wholly upon the value of the ore or ground—it is to be noted that, among a certain class of minds, there still lingers a lurking belief in the efficacy of "cheap labor" as an economic factor. Those people forget or ignore that in all cases the quality of the labor is to be taken into consideration as well as the rate. "Cheap" labor is often the dearest kind to its purchaser. "Cheapness" is a relative term. As in buying advertising space, so in buying labor; it is not what you pay, but what you get for what you pay that determines the value. In this matter of labor for mining purposes it is almost an axiom that labor low in price is also low in efficiency. It is the experience of men who have carried on great mining and engineering enterprises in different parts of the world that, after all, the nominal rate of wages made little difference, for the cost of what may be styled a unit of work is pretty nearly the same everywhere. With this view, the Eastern idea is untenable—that because one can hire a Japanese or a Corean for 25 cents per day, therefore the mining work must result all the more profitably.

THE cyanide process is well suited to a limited class of ores, is fairly successful in many cases where other processes produce a less economical result, but can not be considered as a universal solvent. In such cases as the Mercur mine, in Utah, it is invaluable, as the ores of that mine would be comparatively valueless by any other treatment. In a modified way, the same may be said of the Witwatersrand, South Africa. The cyanide process is best suited to siliceous and limestone ores, in which the gold is finely divided. It will make a fair extraction from pyritic ores in which oxidation has not begun. It is suited to old tailings weathered and leached by rains, and to new tailings where the leaching is made too slow by slimes. Whatever difficulties may arise in the lines mentioned will probably prove to be mechanical ones. It is not well suited to ores carrying coarse gold, as the time required for solution is too long; nor is it wholly successful with ores carrying copper. For nearly ten years there has been a constant advance in practical knowledge of the cyanide process, the experiments and successes having been chronicled in these columns by those who have most largely contributed to its development.

THE dreadful disaster at the Pleasant Valley coal mine, Scofield, Utah is still the theme of current comment. Utah's State Mine Inspector, Gomer Thomas, says: "The accident was caused by the neglect of the Pleasant Valley Coal Co. I do not want to call it criminal negligence, because it does not amount to that. But there has been considerable carelessness. The dust in tunnel No. 4 and in the various cross-entries and 'rooms' should have been sprinkled with water. Had that been done, none could have arisen to be ignited. The coal in No. 4 has a larger percentage of fixed carbon than in No. 1, and was, I think more liable to be ignited. Consequently there should have been greater precaution taken than in the old property." From every quarter is sent prompt and substantial sympathy. David Keith wired $1000 from San Francisco; so, likewise, did Dr. Bell of Colorado Springs, Colo.; C. S. Battermann, chief engineer Boston & Montana mine, Butte, Montana, also wired $1000 on behalf of the employes in aid of the suffering families. From every part of the mining country come such contributions in lesser individual extent, but aggregating considerably over $100,000. The total number who perished is stated to be 200.

WITH party politics of course this paper has nothing to do, but in connection with that higher politics—the science of government and interest in public affairs—is to be noticed the influence that the mining industry and its products exert in the politics of the past few years. Nothing in the last presidential election was so prominent as the question of the cost of production of the precious metals and in general the methods of mining. And all this gave new impetus to the business and lent new interest to that most ancient of all the world's trades and arts. To nothing more than to such widespread public interest does mining owe its present prominence. While the old-time romance and mystery of mining long since departed, the inquiry and knowledge have led many to see that mining was like any other business, with the same risks, the same successes, the same possibilities of profit when rightly managed, and that skill and caution, ability and judgment reaped such reward in the field of mining as they do in any other legitimate industry.

ON page 522 appears a full detailed official statement of the mineral product of California for 1899. The report is so elaborate as to render editorial discussion unnecessary, as the statistics speak for themselves. Most noticeable is the oil output, which has increased from 1,240,223 barrels in 1895 to 2,667,875 barrels in 1899, California now ranking fourth among the States of the Union in petroleum production, with a value of output in '99 aggregating $2,660,793. The industrial importance of this can not be overestimated, for the absence of cheap fuel has heavily handicapped California's manufacturing industries.

Concentrates.

POWDER should never be thawed by dry heat.

SEVERAL LOCATIONS may be embraced in one advertised application for patent.

THE election of a non-stockholder as a director of a California corporation is illegal.

IN Arizona newly constructed railroads are exempt from taxation till Jan. 1st, 1902.

GOLD DREDGING MACHINES are now operated by steam, electricity and gas engine.

THE Kennedy mine, Amador county, Cal., is probably the deepest purely gold mine in the United States.

IN Russia the private gold miner is compelled to send all the gold he extracts to the nearest government smelter.

THE Gwin mine, Calaveras county, Cal., secured a U. S. patent in 1897. The cost there of mining and milling is less than $2 per ton.

CARBOLIC ACID has been recommended for use in tempering steel tools, but with what practical success "Concentrates" is unable to say.

IN a stream current of 1½ miles per hour of the water next the bed gravel stones 1 inch diameter will be moved; a 3-mile current will scour the channel.

ON April 21st the population of Dawson, Y. T., was 5404; of Klondike, 3397. Dawson miners think little of Cape Nome, but there is an exodus to the Koyukuk.

ANY ONE wanting to know anything about mica can address A. O. Schoonmaker, 158 William St., New York City, with probability of success in securing the desired information.

PURE tungsten may be made by first forming the chloride of the metal, then oxidizing this, and reducing the oxide by means of an electric arc, pure metallic tungsten resulting.

A HOLE 12 inches by 12¾ inches through a 1½-inch plank, 6-inch head above top of opening, will each minute discharge 200 miners' inches, each miners' inch equaling 1.4994 cubic feet.

FIGURING from 1860, it is calculated that about 25% of the debris in California river beds is due to the hydraulic miners, about 75% to natural erosion and the general result of settlement and agricultural progress.

UNDOUBTEDLY there is gold in the ocean, "millions of tons of it," but to extract it at a profit is as yet an unsolved problem. It is not "impossible"—nothing is "impossible," absolutely; but it has not yet been done.

AT one time in its history the El Callao mine, Venezuela, S. A., had upon it nearly thirty companies, working 758 stamps, but it is now about worked out. The ore was very rich, but the cost considerable, averaging $14 per ton.

SAN FRANCISCO could probably put dynamite afloat in South African ports for 17 cents per pound, but till the close of the South African war and the consequent end of the powder monopoly in the Transvaal nothing will be attempted.

THE Rio Tinto copper mines, Spain, were worked by the Romans nearly 2000 years ago. The present workings are in an enormous bed of pyrites, carrying about 3% copper. There are uncovered reserves of (estimated) 15,000,000 tons ore.

POSSIBILITY of error in hand sampling is so great as to recommend the use of automatic ore samplers to insure uniformity and accuracy. There are several, and any mining machinery manufacturer can supply one that would give satisfaction.

THE latest in metallurgy is the process now being patented by Metallurgist Bulfried of Salt Lake, Utah, to get the copper out of the amalgam direct. The treatment is said to be feasible and susceptible of great economy over present methods.

"CHLORINATION" does not appear in some of the dictionaries, but it is a regular word coined by the prescriptive right of genius. It was first used by its inventor, G. F. Deetken of Placer county, Cal., and first appeared in this paper in 1860.

TO BRONZE COPPER, scour the metal thoroughly; mix castor oil, 20 parts; alcohol, 80 parts; soft soap, 40 parts; water, 40 parts; apply this mixture with a brush; leave on till the required shade is obtained, dry with hot sawdust and coat with a very dilute varnish.

A MIXTURE of mica, axle grease, tar and summer oil, the latter two to be free from acid, is recommended as a lubricant for wire rope or flat cable. Various standard preparations, their composition and how to use them for preserving cables have been published herein from time to time.

ALL our advertisers are deemed reliable. Constant effort is made to maintain such a standard that the appearance of a firm's announcement herein is evidence that it is a reliable concern. Proffers of advertisements are often refused, as there is a certain class of patronage that neither the paper nor its readers can afford.

THERE is unavoidable repetition of various matters in these columns, though constant effort is made to reduce such repetition to a minimum. When extended information is asked reference is sometimes made to preceding numbers containing the desired answer, but it occasionally happens that the question is reanswered, and, to be technically correct, it is often the case in such instances that the terms used must, necessarily, be the same, as any variation therefrom would be inexact and misleading.

CONCERNING loss of gold and silver during scorification assay the result of a large number of assays gives the average loss by the entire process 2.54%, of which 1.99% was in cupellation and 0.55% in scorification. With gold, the loss in the entire process averaged 0.87%, of which 0.296 was in cupellation and 0.574% in scorification.

VARISCITE is found at Cedar valley, Utah Co., Utah, about four miles from Mercur, in metamorphic limestone. It is a green mineral, of composition similar to turquoise, its base being a hydrous aluminum phosphate, its coloring principle being occasioned by iron or manganese. It is susceptible of high polish, and makes a beautiful gem.

INDUSTRIAL CHEMISTRY is a most important study, as to chemistry as much as any other one branch of science is mining and metallurgy indebted for advance and economic improvement. The application of chemistry has diminished cost, created markets and made profit possible in enterprises formerly carried on, if at all, at a loss.

FOR mining purposes British Guiana is divided into five districts. The local mining laws provide that no placer claim shall exceed 1500 feet in length or 500 feet in width and that no one person shall hold more than five placer claims in one district. The government royalty is 90 cents on each ounce gold, and 4 cents on each ounce silver.

LIQUID CHLORINE has not worked well, not being economically satisfactory in California or Colorado, where bleaching powder is preferred. It is prepared by liquefaction with a special form of pump, and is kept and carried in steel cylinders. Its density is about 1.33; at 15° C. its pressure is six kilograms; at 35° C. it is ten atmospheres.

WHAT kind of battery is best for home use to run one or two hours depends for what purpose one wishes the battery. If for bell ringing, or such intermittent work, then what are called "open circuit" cells are what is wanted. If for long-continued use, or where large current is required, then a gravity battery or one of the two-fluid non-polarizing cells would probably be best.

IN assaying copper materials for gold and silver sodium chloride is employed by some assayers to separate the silver alloy with metallic gold after dissolving the material in nitric acid; but should this salt be used carelessly, or in excess, there is danger of losing some gold from the formation of a little aqua regia in the liquid. Sodium chloride solution may be added drop by drop until all the silver is precipitated.

IN an 850-pound stamp the shoe would weigh 358 pounds; the head, 228; tappet, 112; shoe, 152. The ordinary arrangement of battery drop in a 5-stamp mill is 1, 4, 2, 5, 3. The ordinary shoe will last five months; to furnish amalgam for 15,000 tons free-milling ore ten flasks mercury should, ordinarily, be sufficient, about 15 dwts. per ton. The average life of a brass wire screen, 30 mesh, is about three weeks.

IT has been frequently asserted that ores should be dead roasted, and the required proportion of sulphur made by adding raw ore, but smelter superintendents and managers do not consider this uniformly correct. It is often the case that complete roasting is not needed, as, for instance, with silver-bearing copper pyrites, which, in order to obtain a good matte, should contain from 10% to 12% of sulphur after roasting.

WHAT is said to be the deepest oil well in America is in the Monongahela river valley, 25 miles from Pittsburg, Pa. The hole has been drilled to a depth of 5532 feet, but the work has been suspended owing to a break in the 2¾-inch rope used. As a result, 1000 feet of rope and a string of tools are at the bottom. Experts are at work and hope to be able to resume drilling soon. It is proposed to sink the well to a depth of 6 000 feet.

IN OCTOBER, '96, a high electrical authority announced that while 15,000 volts were being successfully transmitted thirty-five miles, yet it was manifest that the transmission of 20,000 volts 50 miles marked the ultimate limit of successful electrical operation. Since then, in southern California, a 33,000 voltage has been successfully transmitted 65 miles, and now, in central California, a San Francisco organization is preparing to transmit the same pressure 150 miles.

THERE seems to be considerable difference of opinion among mill men as to whether hard or soft rolled copper is best for amalgamating plates, though the preponderance of practical testimony favors the soft copper, as it retains the mercury and amalgamates more readily than the hard. Those who favor the former say that hard copper has the advantage of not absorbing so much amalgam. As to the thickness of the plates, the same difference of opinion prevails: ⅛-inch is in common use; some mill men find $\frac{1}{16}$ or $\frac{3}{32}$-inch works well for apron plates and ⅛ to $\frac{3}{16}$-inch for inside plates.

PROBABLY the superintendent was right in refusing admission to the mine. The motives of mine managers and superintendents in declining underground inspection to unauthorized persons are often misunderstood. It is not "surliness" nor a fear that the visitor "might find something out" that impels such refusal, but a fear that the visitor may not be able to take care of himself. A mine is not the safest place in the world for an inexperienced man, and should an accident happen, resulting in serious personal injury, the superintendent would be the first one blamed.

FUEL BRICKS of crude petroleum are made in Europe. The mixture is in proportion of one liter of petroleum, 10% resin, 150 grams powdered soap, 333 grams caustic soda; the mixture is heated and stirred at the same time; solidification begins in about ten minutes; if there be a tendency to continue liquid, a little more soda is added. The mixture is stirred until the mass becomes nearly solid. The thick paste is then poured into molds, which are placed for ten minutes in a drying oven. After cooling, the briquettes are ready for use.

WHERE one purchasing a mining claim from a person engaged in litigation concerning it agrees to pay the price into the court at the end of a year if the suit is not then determined, to abide the result thereof, he cannot escape making such payment on the ground that his deed failed to include the most valuable part of the claim, when it appears that he has brought an independent suit to reform the deed. The purchaser, in such case, is liable for interest during the time he withholds the money, although the agreement makes no mention thereof, if he is in possession of the mine and engaged in working it.

THE reason that shifting the brushes on a dynamo causes the sparking to cease is because the sparking is due to a shifting of the neutral line caused by armature reaction. As this neutral line shifts, the brushes must also be shifted to follow it, otherwise sparking will result. In a two-pole machine, for instance, the current in the armature coils tends to form poles in the armature at right angles to the poles induced in it by the fields. The result is a pair of compromise or resultant poles which are at right angles to the line of commutation. As the current in the armature increases, the armature poles become relatively stronger and the compromise poles will be shifted in that direction, so that the brushes, if not moved also, will communicate while the coils are cutting lines of force and therefore generating an electromotive force.

IT were difficult to fix upon the money value of a life in a way that would admit of general acquiescence. The economic value of an individual is what he has cost his family, the community, the State, for his living, development, and education. It is the loan which the individual has had from the social capital in order to reach the age when he can restore it by his labor. Just what this value is in dollars and cents can not be accurately determined. English statisticians figure that an English farm laborer is worth $980: French militarists say a French soldier is worth $1200: in this country judges and juries have put $5000 as the individual's value. New York courts think $4000 is fair: Pennsylvania places the value at $3000. These figures seem low. What would appear a better basis is to calculate the amount of production: a man earning, say, $20 per week, or $1000 per year, represents an investment bringing in so much. At ruling interest rates —5%—it would take $20,000 to earn $1000 per annum, and any machine, human or otherwise, netting so much, may be considered worth the amount stated.

THE purchase by a corporation of a part of its own stock, until reissued by the corporation, in effect reduces its stock to that extent; and the sale by it of its property and franchises does not carry with it the shares of its own stock bought in by the corporation for delinquent assessments of a stockholder. These results rest upon several propositions of law. The capital stock of a corporation, previous to its issue, cannot in any proper sense be called the property of the corporation. Stock in a corporation represents an interest in the corporate property, and is evidence that the lawful holder is the owner of an interest therein in the proportion that his shares bear to the whole number of shares issued and held by the stockholders. The legal title to the property, represented by the stock, is vested in the corporation for the benefit of the stockholders. So, if a corporation has power to reduce its capital stock, it may effectually do so by purchasing and retiring a portion of its shares. So long as it remains in the treasury it represents no part of or interest in the property of the corporation. It is then as though it never existed.

DRAWBAR pull, measured in pounds, is the number of pounds that would be registered on a spring balance if the latter formed a connecting link between the pulling and the pulled object; if a cord were attached at one end to the ceiling, and suspended at the other end a spring balance to which was attached a weight of 100 pounds, the register on that balance would be 100, and one might say that the drawbar pull under these conditions would be 100 pounds. Should the string be cut loose from the ceiling so that the string, balance and weight were free to fall, there would be no longer any tension on the string or balance, the latter would register 0, and the drawbar pull would be 0. If, however, one should retard the fall of the combination by supplying friction to the string, the balance would register something, depending upon the amount of friction which the weight overcame. In the first two cases the drawbar pull would be doing no work, and could not be translated into horse power, because the term "horse power" implies a rate of doing work. In the third example it would be translatable into horse power if one knew just how much friction it was overcoming and the rate at which it accomplished this work; but as the question stands it cannot be expressed in horse power.

"Masonry Dams and Retaining Walls."

To the Editor:—I have read with great interest the exhaustive engineering article written by Mr. Geo. T. Pardoe, that appeared in the five issues of the paper ending March 17, and, while it is of approximate value, I do not think it gives correct results, as he appears to carry a considerable and indeterminate error all the way through.

Mr. Pardoe assumes that the point of application of the resultant of the horizontal pressures against any section will be at a depth below the surface of water equal to two-thirds the depth from surface of water to the base of the section considered. This is true in the very rare instances where the water is just level with the top of the wall. In the case he assumes for illustration (water flowing 3 feet deep over the crest), it is not true. Neglecting, as he does, the fact that this depth of water adds a stability of some 187 pounds per square foot of base to the section considered, the formula for height (or depth) of center of pressure becomes

$$H = \frac{2}{3}\,\frac{X^3 - Y^3}{X^2 - Y^2}$$

where X is the distance from surface of water to base of section considered and Y is depth of crest of dam below the surface.

Applying Mr. Pardoe's formula, to a section 6 feet high with 6 feet of water over the crest his point of application is 4 feet above the base, or two-thirds the height of the section, while if we consider a section 4 feet high with 8 feet of water over it he would make the c. p., as before, 4 feet above the base or just at the top edge of the dam, and lastly, as a reductio ad absurdum, if the section remain 4 feet high and the water be 11 feet over it, his rule would place his resultant pressure 5 feet above the base or a foot above the top of the dam in the flowing water, which is equivalent to saying if you increase the depth of water enough you will have no pressure at all on the wall which sustains it.

If D is the height of the dam, or of that section of the dam considered, and W the depth of water above the crest of the dam, and H the height of center of horizontal pressure above the base of it, Mr. Pardoe's theory may be formulated as $H = \frac{D+W}{3}$. Now, when the water is just level with the crest, W equals O and H becomes $\frac{1}{3}$ D, which is correct. When the depth of water increases to twice the height of the dam, H becomes equal to D, or the center of pressure is at the upper edge of the dam—manifestly incorrect.

If we increase the depth still further and W becomes greater than 2 D, H will become greater than D, or, in other words, the center of pressure will be above the top of the wall, out in space in a free-moving fluid.

Now, since our center of pressure on a body is merely a point at which may be applied a single force the resultant in magnitude and direction of all the forces acting upon that body, replacing all of them, it becomes manifestly impossible that the point of application of such resultant can lie entirely outside such body and disconnected therewith. If following an hypothesis leads to such a result, it is very bad for the hypothesis.

Suppose, for instance, a dam 10 feet high, over which passes a flood to a depth of 21 feet. By the Pardoe rule, all the thrust on the dam may be concentrated at a point at a height above the base equal to 10 feet plus 21 feet divided by 3, equal to 10 feet 4 inches above the base, or 4 inches above the top—a manifest absurdity. I do not know just what would be the result, but presume the center of pressure would float away down stream, carrying with it its attached resultant force, and both would be irrevocably lost. Not only would this be fraught with unknown dangers to the dam, thus suddenly bereft, but, further, a cloud would be cast upon our sacred law of the conservation of energy. You can not go on losing resultant, or any other kind of forces, out of the world with impunity.

I have sketched two diagrams for the height of center of pressure of various heights of dam, each with varying depths of flood on the crest. The first shows the heights of center of pressure above the base of a 10-foot dam for varying heights of water upon the crest, the second the same for a 20-foot dam; the upper line in each case being derived from the Pardoe rule, and the lower one by the rule given above; that is, that the center of pressure is at a depth below the surface of the water equal to

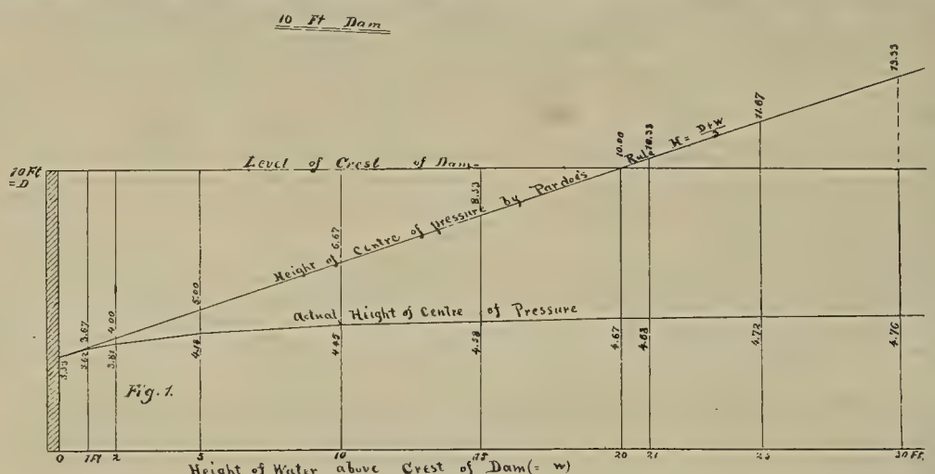
$$\frac{2}{3}\,\frac{X^3 - Y^3}{X^2 - Y^2}$$

which depth we will call "N," where X is the depth of base of dam below water surface and Y is depth of crest of dam below the same point. We can convert this equation into a form corresponding with the one in which I have formulated Pardoe's rule, by remembering that in the above X is equal to D plus W, and Y equals W, whence X minus Y equals D. Then, since H plus N must equal D plus W, we have H equal to D plus W minus N or H equals

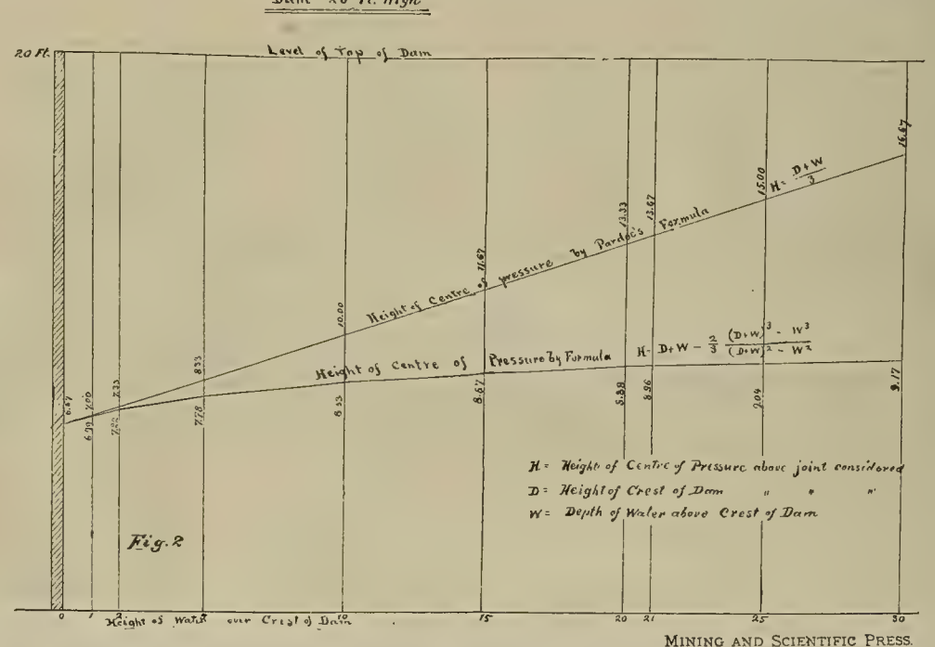
$$D + W - \frac{2}{3}\,\frac{(D+W)^3 - W^3}{(D+W)_2 - D^2}$$

a simpler equation than it looks to be, which I have called formula 2.

In the diagrams the lines of H coincide at $\frac{1}{3}$D when the flood depth is zero, and thence diverge. By Pardoe's rule the line of height of center of pressure for varying pressures on the same dam is a straight line, rising 1 foot in 3, and passing outside the dam when W becomes equal to 2D. By formula 2 this line becomes a curve, probably a parabola, and in a general way it appears that beyond the point where W equals 2D (at which point H always equals $\frac{4}{9}$D) the increase in value of H for increased flood depths becomes almost inappreciable. Now, the divergence between these two lines measures the constantly increasing error in the Pardoe rule, and it affects the design of the dam thus:



Since the direction of the resultant pressure (i. e., its angle of dip, so to speak) is fixed in all cases by the ratio which the horizontal pressure through the center of pressure bears to the vertical pressure due to weight and acting through the center of gravity, any increase of H must cause the resultant to cut the base at a greater distance down stream from the vertical through the center of gravity. Now, by the rule of avoiding tensile strain in such structure, this line may not cut the base nearer than one-third the thickness from the face of the wall, so that the thickness of the dam at any joint will be increased by $\frac{2}{3}$ the distance that the foot of this resultant is erroneously moved down stream.



In an ordinary masonry dam of average materials and dimensions this widening of the joint will amount to about three-fourths the height through which the center of pressure is wrongly raised. Inspection of the diagrams will show that within reasonable limits this thickening may amount to from 3 to 6 feet, and for a dam 50 feet high and 200 feet long it would be from 1000 to over 2000 cubic yards, which at $8 to $15 per yard runs into money pretty fast.

It is no more an engineer's duty to build safely than it is to build economically. If he is worth anything he should do both, although I remember that one of the best things Arthur Wellington ever wrote was that the layman is prone to judge the engineer by the piles of earth, stone, wood and iron he has made, rather than by those he has avoided making.

In further criticizing the paper, which as a whole had much in it of value (I enjoyed reading it and got some suggestions from it even if I did not agree with it all), I think the last installment was not up to the standard of the other parts. The reference to a weir as a low, unimportant structure which might be made of sticks and mud was rather unfortunate on the tail of a four weeks' discussion of masonry weirs from a mathematical standpoint. Colloquially, "dam" means almost any structure to hold up water. When the engineer differentiates it is into "dam" as a retaining wall simply and "weir" as a structure designed to carry a flow of water over its top. This was the kind of a structure Mr. Pardoe selected as a type to illustrate. Johnstown, Williamsburgh, Austin, and some others tell the story of making "weirs" of sticks and mud. I except to the statement that in using Portland cement the limit of proportions should not exceed 2½ sand to 1 cement. The best practice is nearly all outside that limit, and 3 : 1 may be taken as average first-class practice, save for facings and specials.

R.

Loss of Energy in Production of Light.

There is a great loss of energy in the manufacture of light through the agency of the steam engine. In practice not more than 7% to 16% of the energy of the fuel used can be realized through the engine, and theoretical considerations establish a limit at 30%. This problem is not unsolvable if there can be devised some means of extracting the energy of coal otherwise than by heat—say in some such manner as that in burning zinc in a voltaic battery.

In the second stage of the operation of producing the electric light, the dynamo is already so nearly perfect that hardly any heat is lost in its conversion into current.

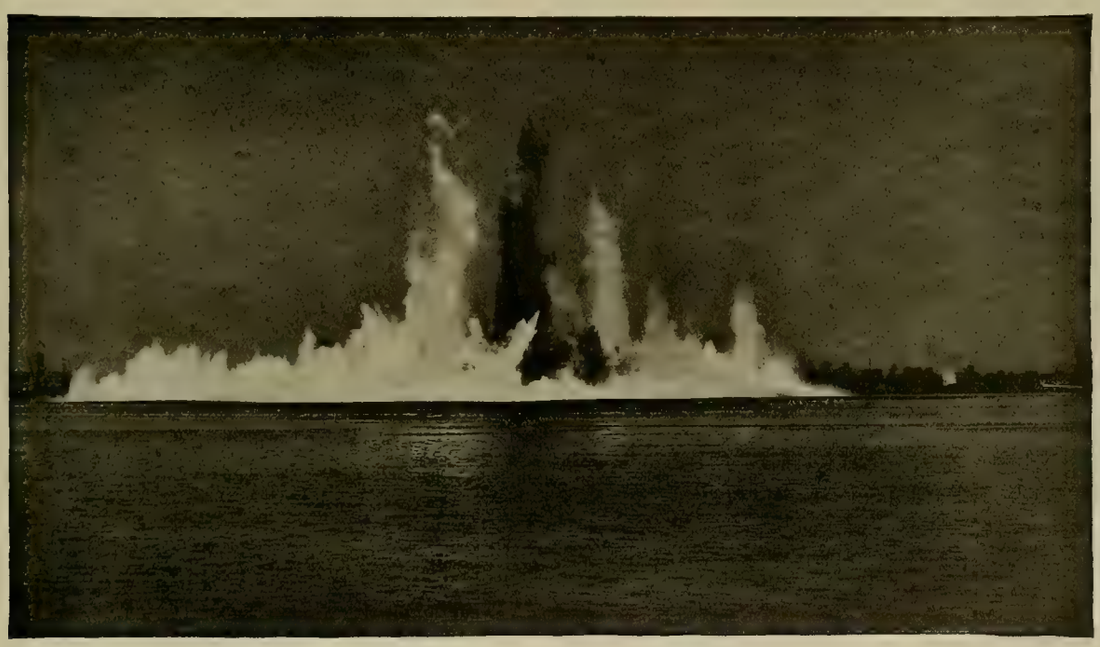
The third stage brings us to the lamp, with 7% of the original energy still available. The only means thus far available for producing luminous energy is

to heat the molecules of some substance, and in this operation we are compelled to waste the greater portion of our available energy in producing heat before we obtain the light rays.

Here, then, is the second unsolved problem, since even in the incandescent lamp and the arc lamp not more than from 3% to 5% of the energy supplied is converted into light. Thus, of the original store in the coal less than three parts in a thousand ultimately become useful. In the last few years, however, some hints of means to overcome the difficulty have been obtained from the proof by Maxwell and Hertz that light is only an electric radiation. Could we produce electric oscillations of a sufficient rapidity, we might discard the molecules of matter, and directly manufacture light without their intervention. To do this we must be able to produce oscillations at the rate of 400,000,000,000 per second. Tesla has produced them in thousands and millions per second, and Crookes has shown how, by means of high vacua, to raise many bodies to brilliant fluorescence at a small expense of energy. These are hints toward a solution of the problem, but give no solution as yet. Prof. Langley states that the firefly spends the whole of its energy upon the visual rays without wasting any upon heat, and is some four hundred times more efficient as a light producer than the electric arc. We have no solution of these problems, but have reason to hope that in the near future one may be obtained, and the human inventor may not be put to shame by his humble insect rival.

Removal of Rocks in San Francisco Harbor.

(Continued from page 517.)



which the drills were operated. A mast 68 feet high and 2 feet square, composed of four timbers 12x12 inches, bolted together, was erected upon the rock. This was maintained in a vertical position by four double steel-wire guys 1¼ inches in diameter anchored in the bottom of the bay. The upper part of the mast was rounded to 18 inches in diameter for a distance of 15 feet, where an 18-inch ball-bearing collar was located, from which the table was suspended by 1¼-inch steel wire cables. This was 160 feet long, 25 feet wide and hung 13½ feet above low water. The framework composing this swinging platform consisted of four stringers, each made up of four timbers 3x12 inches, bolted together and secured by 1-inch straps to cross ties, 8x10 inches, 20 feet apart. There were used 16,319 pounds of nitro-gelatine containing 90% of nitro-glycerine, which was furnished in cylindrical pasteboard cartons weighing between fifty and sixty pounds. The amount contained in the holes varied from 345 to 1067 pounds.

The electrical appliances for the explosion were arranged by F. Broili of the California Electrical Works. The electric fuses were insulated into the gelatine and several sticks of giant powder laid in to make explosion doubly sure. The wires connecting with the water-proof fuses were fastened to ropes wrapped around the gelatine. Two cylinders of the explosive were thus prepared, lowered into each hole and covered with 50 to 100 pounds more in small pieces. The fuses were run in two independent circuits, and each circuit had two fuses, or four in each hole. One terminal of each circuit was grounded by connecting it with the steel cable used to support the insulated cable, and the other terminals were connected to above-mentioned insulated cable. Before connecting with the cable, each circuit was tested for insulation and resistance with a low E. M. F. and a voltmeter. The fuses were exploded from a barge about a mile distant by means of 120 cells of Mesco dry batteries. The explosion followed the closing of the switch apparently instantaneously.

Before the explosion took place the platform was removed, and only the mast, guy wires (which had been connected to floating buoys) and some framework around the pipes, so the electric wires could be connected, remained.

It is interesting to note that no outrushing concentric waves were made, and to those persons on the barge to the leeward no vibration of air was felt; the sound made was about as loud as a pistol shot, but not so sharp, and comparatively few fish were killed. Triangulation from Angel island showed that portions of the disintegrated rock were carried to a height of 996 feet.

This is one of the largest enterprises of the kind in the history of removal of such obstructions. After the explosion there was 14 feet of water where the main rock stood, and the contractors claim that, by subsequent dredging, the required depth of 30 feet will be secured, the assumption being that, after the explosion, much of the shattered rock settled back in its original position. Herewith is an engraving of the explosion of Flood Rock, Hell Gate, New York harbor, procured to accompany this article. Flood Rock was mined out, leaving only a thin shell, and then a giant blast blew the remaining rock into fragments, which were then removed by dredgers. Other rocks have been removed by drilling holes in the rock by machines carried on scows or on platforms set on spuds, which rested on the bottom, charging the holes with explosive and firing by electric current, thus removing slab after slab from the side of the rock, as in quarrying. The debris has to be gathered up by a dredger, as in this instance. Other rocks have been removed by special methods designed by the contractors.

View of Explosion of Flood Rock in Hell Gate, N. Y.

Illustrating the most prominent case of submarine mining. Little giant drills were selected for greater part of work of excavation.

Prehistoric Gold Mining in Africa.

When I went into the Geelong ancient stopes (which are left intact) I spent considerable time fossicking about at depth. I was happy, in turning over the debris, in coming upon two granite balls, bearing evidence of having been used as hammers, almost exactly round and about the size of two hands clenched. In parts the ancient stopes were very narrow, and one had to penetrate to cavities (stopes) of not more than 2 or 3 feet from roof to foot wall. In other parts the stopes were quite cavernous. In the latter the wall was frequently alcove in character, smooth, and in parts still black from smoke, and among the debris were remains of charcoal. It is believed (and I can quite credit the theory) that the procedure of the ancients was to light fires in the stopes and then, when the gold-bearing rock cooled, to use granite hammers to break down the ore. To go further, the chipped-off gold-bearing rock would probably be put into the native baskets and carried to the surface. I found occasionally at the top of the kopjes, or little hills, where there were little masses of hard rock, patches of indentations in flat areas of rock, just as though mortars had been sunk into the rock. Beside the pots were numerous slight elongated indentations. It would seem from other rock implements of grinding character that the indentations were made in the process of grinding the rock flakes into powder, after the rock, roughly broken out in the stopes, had been broken up small.

In nearly all cases mines are near pools or streams and frequently by the sides of these bodies of water are found rock pots somewhat similar to those found on the kopjes. We can imagine that the powder was deposited in these rock pots, flushed with water, the sand driven off and the gold, sinking in the bottom, was eventually collected.—R. R. Mabson, Engineering Magazine.

Modern Boiler Making.

During the past twenty years the boiler shop has undergone a change, the magnitude of which is paralleled only by that in the machine shop. But while the latter has been mainly brought about by the introduction of new and improved machine tools, the former is due chiefly to the development of a new material—steel. But for this, the old methods which were applicable to wrought iron would probably have not been altered much even at the present time.

There are many points in common between the machine shop of to-day and that of twenty or thirty years ago, but there are scarcely any between the boiler shops of the two periods. Twenty or twenty-five years ago few firms were making steel boilers; to-day the construction of new iron boilers is becoming exceptional. With the new material nearly every machine used, nearly every shop method adopted, nearly every detail of the work has been altered or modified in a greater or less degree. Hand work, too, is practically extinguished in the most modern shops. Formerly there was a good deal of flanging, bending, hammering, chipping, welding, riveting drifting, and tapping done by hand, as there is still in small establishments; but good boiler work is now almost entirely a matter for machine tools, and the importance of these, therefore, has grown to an immense extent. A high-class modern boiler is now machine-made almost entirely from beginning to finish. Since the errors of hand work are thus eliminated, two boilers made to the same standard are exactly alike and afford a striking illustration of the excellence of the machine work now done in the boiler shop.

Boiler making, to be carried on according to the best modern methods, requires a very large plant—so large that many a well-sized shop cannot afford it all. With only a moderate amount of machinery good work can be done, but it has to be done in a more roundabout way, with considerable increase in cost, which, as in other departments, sorely handicaps such firms in competition with the big shops.

At the present time there are four power agencies in use in boiler shops. Steam and water vastly predominate; nearly all the heavy machinery is driven by these agents. Air is chiefly used for operating small tools, such as drills and calking hammers, while electricity is employed for the same purpose for driving heavy machine tools. Steam, water and air are each suitable for riveting, though the first has been largely displaced by the last. Water power is adopted for heavy flanging, shearing and punching; steam is employed for bending rolls, drills and most of the machine tools used for cutting purposes. Any large modern boiler shop, therefore, must needs be in possession of at least three power plants—steam, water and air—to which it may be desirable to add the electric motor. The applications of compressed air are growing at a phenomenal rate, being applicable to all the small portable tools used in boiler work. In large shops, in which numerous machines are widely scattered, any agency seems better than shafting and belting, and before long we may anticipate that the extension of the uses of air for small tools will be paralleled by that of electric driving for heavy tools, in place of belts and independent engines.—Joseph Horner, in Cassier's Magazine for May.

AS INDICATING that the mail routes in Alaska are practicable, and that the carriers there are giving prompt service, it is said at the Postoffice Department that a letter mailed at Cape Nome, February 10th, reached the following places on the dates named: Circle City, April 1st; Dawson, April 11th; Seattle, April 29th, and Washington, D. C., May 5th. Prior to this season it has been impossible to get mail from these northern points after December 1st.

Mineral Product of California for 1899.

State Mineralogist A. S. Cooper reports the yield and value of the mineral substances of California for 1899 as follows, as per returns received at the State Mining Bureau in answer to inquiries made to producers:

Antimony	75 tons	$13,500
Asbestos	30 tons	750
Asphalt	15,060 tons	308,130
Bituminous rock	40,321 tons	116,097
Borax	20,357 tons	1,139,882
Cement	60,000 bbls	180,000
Clay brick	125,950 M	754,730
Pottery	40,600 tons	42,700
Coal	160,941 tons	420,109
Copper	23,915,486 lbs	3,990,534
Fuller's earth	620 tons	12,400
Gold		15,336,031
Granite	128,924 cubic feet	141,070
Gypsum	3,663 tons	14,950
Lead	721,000 lbs	30,642
Lime	299,854 lbs	314,575
Limestone	30,769 tons	29,185
Lithia mica	124 tons	4,600
Macadam	323,590 tons	239,867
Magnesite	1,280 tons	18,480
Manganese	295 tons	3,165
Marble	9,682 cubic feet	10,550
Mineral paint	1,704 tons	20,294
Mineral waters	1,338,537 gallons	406,691
Natural gas	115,110,000 cubic feet	95,000
Paving blocks	305 M	7,861
Petroleum	2,677,875 bbls	2,660,793
Platinum	300 ounces	1,800
Pyrites	5,400 tons	28,620
Quicksilver	29,454 flasks	1,405,045
Rubble	641,308 tons	547,025
Salt	82,654 tons	149,588
Sand glass	2,000 tons	2,000
Quartz	1,000 tons	1,500
Sandstone	56,264 cubic feet	103,384
Serpentine	500 cubic feet	2,000
Silver		504,012
Slate	810 squares	5,900
Soda	10,000 tons	250,000
Total		$29,313,460

In the previous year the total product was valued at $27,289,079; so the average increase for the year is $2,024,381. The total product of metallic substances for the year 1899 was $21,305,023—an increase of $1,281,989. This includes gold, silver, mineral paint, quicksilver, antimony, copper, lead, manganese and platinum. (Silver is given in commercial value or amount received for it by producers. The coining value of silver would be $1,106,578.)

The total value of non-metallic substances was $2,446,070—an increase of $343,998. This includes borax, coal, mineral waters, salt, asbestos, gypsum, magnesite, pyrites, lithia mica and fuller's earth.

The total value of hydrocarbons and gases was $3,180,020, an increase of $109,426, including asphaltum, bituminous rock, natural gas and petroleum. The total value of structural materials was $2,382,347, an increase of $288,968. This includes brick and pottery clays, hydraulic cement, lime and limestone, macadam, rubble and concrete rock, paving blocks, marble, granite, sandstone, serpentine, slate, quartz sand and glass sand.

The relative value of the principal mineral products of the State is as follows: First, gold; second, copper; third, petroleum; fourth, quicksilver; fifth, borax.

There are 24,991 men employed in the industries represented in the above table, with the exception of the petroleum industry. In that branch so many new wells were being opened at the close of the year, and still unproductive, that it was found impossible to make a proper enumeration of the number of men employed. None are, therefore, credited to that industry.

The relative rank of the counties of the State, in point of mineral production, is given in the following table. In each case the value given includes that of all mineral substances combined produced in the respective counties for the year. Some counties produce, in addition to gold and silver, five, six or seven other substances, while other counties, which produce little or no gold or silver, produce in large quantities quicksilver, mineral oils, copper, lead, asphalt, structural materials, etc. The figures include aggregate value of all mineral products, including precious metals. These latter are based upon U. S. Mint returns for the year. The term "undistributed" includes total value of such substances as are grouped to avoid disclosing private business, as in the case of single operations in a county. In the large and complete table published in Bulletin No. 17 by Charles G. Yale of the State Mining Bureau, from which these figures are taken, the amount and value of each substance in the respective counties is set forth. It is, therefore, necessary in some cases to place the figures in the "undistributed" column:

1—Shasta	$ 4,661,980
2—Nevada	2,231,898
3—San Bernardino	1,859,351
4—Los Angeles	1,729,964
5—Tuolumne	1,650,880
6—Amador	1,593,720
7—Calaveras	1,303,188
8—Placer	1,177,812
9—Kern	1,027,366
10—Siskiyou	991,871
11—Mono	749,556
12—Trinity	715,595
13—Napa	701,416
14—Ventura	613,450
15—Mariposa	565,636
16—Alameda	508,799
17—Butte	504,795
18—Fresno	497,234
19—Inyo	473,851
20—Sierra	450,474
21—El Dorado	425,346
22—Santa Clara	391,940
23—San Diego	381,215
24—Plumas	381,166
25—Santa Barbara	318,528
26—San Benito	290,495
27—San Francisco	275,694
28—Riverside	272,848
29—Santa Cruz	251,392
30—Humboldt	235,274
31—Sacramento	233,755
32—Lake	204,103
33—Yuba	189,939
34—Sonoma	142,330
35—Contra Costa	135,113
36—Madera	115,620
37—Orange	112,077
38—San Joaquin	111,880
39—Marin	81,150
40—San Luis Obispo	68,548
41—San Mateo	58,225
42—Lassen	28,898
43—Tulare	20,810
44—Tehama	19,800
45—Monterey	17,378
46—Solano	16,937
47—Stanislaus	11,769
48—Kings	11,550
49—Mendocino	8,788
50—Del Norte	4,450
51—Colusa	1,420
52—Yolo	384
Undistributed	485,802
Total	$29,313,460

All the asbestos produced in California in 1899 was from Riverside county. Asphalt was produced in Fresno, Kern, Los Angeles, Monterey, San Benito, San Luis Obispo, Santa Barbara, Santa Clara and Ventura counties. Bituminous rock came from San Benito, San Luis Obispo and Santa Cruz. The borax yield was from Inyo, Kern, San Bernardino and Ventura. Brick clays were utilized in Alameda, Butte, Fresno, Humboldt, Kern, Kings, Los Angeles, Madera, Marin, Mendocino, Monterey, Orange, Riverside, Sacramento, San Bernardino, San Diego, San Joaquin, San Luis Obispo, San Mateo, Santa Barbara, Santa Clara, Shasta, Sonoma, Tehama, Tulare and Ventura countries.

Pottery clay came from Amador, Placer and Riverside. All the hydraulic cement came from San Bernardino county. Coal was produced in Alameda, Amador, Contra Costa, Kern, Orange and Riverside. The copper was mined in Calaveras, Nevada, San Bernardino and Shasta counties. The pyrites were all from Nevada county. Granite was quarried in the counties of Madera, Placer, Riverside, Sacramento, San Bernardino, San Diego, Sonoma, Trinity and Tulare.

All the fuller's earth came from Kern county. Gypsum was produced in San Benito and Los Angeles counties; and lead was from Inyo, Mono and San Diego counties. Lime and limestone were quarried in El Dorado, Kern, Mono, Monterey, Riverside, San Benito, San Bernardino, Santa Clara, Santa Cruz, Shasta and Solano counties. San Diego county was the only producer of lithia mica.

The principal macadam quarries are in Alameda, Los Angeles, Marin, Sacramento, San Benito, San Bernardino, San Francisco, San Mateo, Santa Clara, Santa Cruz and Solano counties. The magnesite came from Napa and Santa Clara counties; and the manganese from Alameda and Santa Clara. Marble was quarried in Amador, Los Angeles and San Bernardino counties.

Mineral paint was mined in Butte, Calaveras, Nevada and Stanislaus counties. The mineral springs which utilize the water commercially are in Butte, Colusa, Contra Costa, Fresno, Humboldt, Lake, Los Angeles, Mendocino, Monterey, Napa, San Benito, San Diego, Santa Barbara, Santa Clara, Shasta, Siskiyou, Sonoma, Solano and Tehama counties. Natural gas was utilized in Sacramento, San Joaquin and Santa Barbara counties. Paving blocks, or basalt, were quarried in San Bernardino, Solano and Sonoma counties.

The platinum came mainly from Trinity and Siskiyou counties. Petroleum was produced in Fresno, Kern, Los Angeles, Orange, Santa Barbara, Santa Clara and Ventura counties. Quicksilver came from Lake, Napa, San Benito, San Luis Obispo, Santa Clara, Sonoma and Trinity. Rubble was quarried in the counties of Humboldt, Los Angeles, Madera, Marin, Monterey, Sacramento, San Diego, San Francisco, San Luis Obispo, San Mateo, Solano and Sonoma. The salt came from Alameda, Colusa, Riverside and San Diego counties. The quartz sand came from Riverside. Sandstone was from Colusa, Los Angeles and Yolo counties. The serpentine was from Los Angeles, slate from El Dorado, Mariposa and Shasta; and soda from Inyo counties.

As far as "banner" counties are concerned in the different mineral products, the following is the record for 1899, with the values of material from the county named. Alameda leads: Salt ($137,088), manganese ($3090), macadam $66,512) and coal ($242,109). Amador leads in marble ($7925), Butte in mineral paint ($9900), El Dorado in slate ($4500), Inyo in lead ($28,135) and soda ($250,000), Kern in fuller's earth ($12,400), Los Angeles in gypsum ($14,250), petroleum ($1,409,356) and serpentine ($2000). Napa leads in magnesite ($17,130) and quicksilver ($598,320).

Nevada leads in gold ($2,171,510) and pyrites ($28,620), Placer in granite ($61,525), Riverside in asbestos ($750), pottery clay ($16,800) and quartz sand ($1500). San Bernardino has the most borax ($1,106,000), cement ($180,000), limestone ($14,810) and paving blocks ($4000), San Diego the most lithia mica ($4600). San Francisco leads in rubble ($221,230), San Joaquin in natural gas ($84,880), Santa Barbara in asphalt ($121,160), and Santa Clara utilizes the most brick clays ($170,455). Santa Cruz produces the most bituminous rock ($70,569) and lime ($176,893). The bulk of the copper comes from Shasta county ($3,565,023), and this county also leads in silver product ($196,213).

It is to be noted that only two counties have the lead in four things—Alameda and San Bernardino. Two also lead in three substances—Los Angeles and Riverside—and the counties of Inyo, Napa, Nevada, Santa Cruz and Shasta lead in two products. The other counties named only have the lead in one substance each.

Earth's Deepest Metal Mine.

The deepest hole ever dug in the earth for men to work in is the shaft of the Red Jacket copper mine at Calumet, Mich. Observers ascending in compartment balloons have secured data of importance regarding meteorological conditions, and underground observations made at a depth of a mile are no less valuable.

It had been thought that such a depth at the bottom of the Red Jacket shaft would have a temperature that would boil an egg. This was found not to be the case, however. Careful tests at the bottom show that the normal temperature at a mile below the earth is only 87.6° Fahr.

The water found at the bottom of the shaft is corrosive to human flesh. Workmen have to wear heavy rubber boots and rubber coats and masks to protect themselves.

The opening is 15½ by 25 feet inside the timbers, cut through adamantine. Giant timbers secure the transit ways for men and materials, for water and electric wires, which illuminate the shaft from surface to bottom. Inside the timbers are six compartments. In four of the compartments slip up and down the ponderous cages, carrying ten-ton loads of rock and moving at the speed of an express train. Up and down in these cages also ride the hundreds of men who work in the mine. In one of the compartments are the great iron pump pipes. In the last will be forced steady currents of compressed air, which runs the drills a mile below the engine house.

The electric light plant is large enough to supply light to a city. A telephone system connects every point of the shaft with a great central exchange above ground.

A network of wires stretches in to the headquarters of the fire department, near the big hole. Thousands of dollars have been spent to bring every part of the shaft within easy communication of the surface in case of fire.

Air as a Lubricant.

Ordinary air is now being used with good results for illustrating the action of a lubricant in a journal bearing in a machine designed by A. Kingsbury. The machine consists of a steel piston or short shaft to be rotated and a cast-iron ring or cylinder which acts as a bearing for the shaft, the whole being supported on rollers mounted on a suitable frame. The shaft weighs 50½ pounds, is 6½ inches long and 6 inches in diameter, and its weight constitutes the total downward pressure on the bearing. The diameter of the cylinder is slightly less than $\frac{1}{2000}$ of an inch larger than the shaft—a fairly loose fit. Both cylinder and shaft are ground exactly parallel.

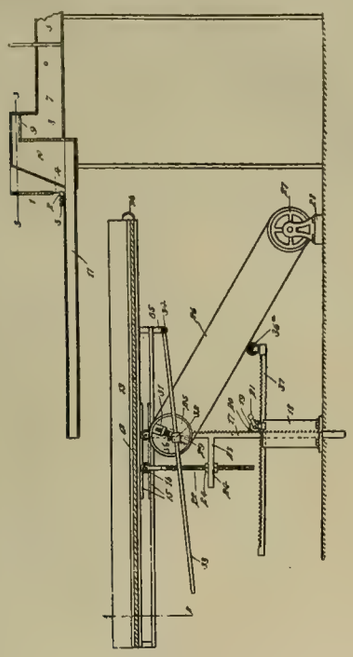
The cylinder is set horizontally, the shaft inserted (both being perfectly clean and dry) and rotated with the hand by the handle at the end. It can be turned with difficulty at first, and the harsh, grating sound of metal rubbing on metal will be heard. With an increase of speed, however, this grating ceases, and the force required to turn the shaft is materially decreased until, after a few revolutions, the shaft becomes entirely free from the cylinder and rotates on the film of air between. Set rotating at, say, 500 revolutions per minute, it will continue to rotate four or five minutes. If allowed to run, the speed gradually decreases from the start until suddenly the piston breaks through the intervening layer of air, and a few more revolutions suffice to bring it to a sudden stop.

If a more conclusive proof is required that the shaft is entirely separated from the cylinder, an electric bell may be included in a circuit of which the shaft is made one terminal and the cylinder the other, when it will be found that the bell is silent as long as the shaft rotates at any considerable speed.—American Manufacturer.

Mining and Metallurgical Patents.

Patents Issued May 1, 1900.

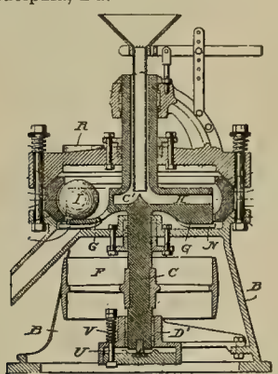
Specially Reported for the MINING AND SCIENTIFIC PRESS.



ALLOY.—No. 648,428; J. Patrick, Frankfort-on-the-Main, Germany.

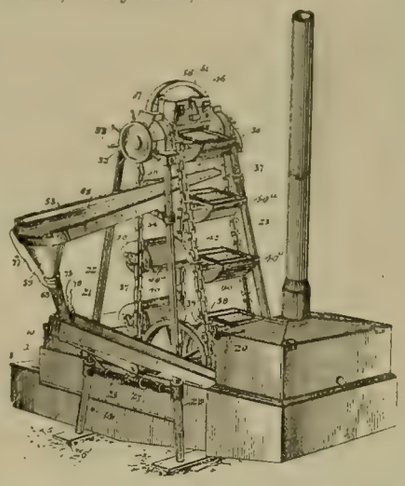
Process for obtaining an alloy of nickel, magnesium and zinc, consisting of adding to nickel and a salt of magnesium, a flux adapted to form a cohesive slag and a reducing agent for magnesium salt, melting the mixture, and introducing zinc into the molten mass and maintaining zinc underneath the slag until it is melted, and finally adding copper to the molten nickel-magnesium mixture at any time with respect to the time of introducing the zinc.

PROCESS OF PRODUCING ALLOYS OF IRON AND TITANIUM.—No. 648,439; A. J. Rossi, New York, N. Y.



Process of producing compound or alloy of iron and titanium which consists in providing a bath of molten reducing metal the heat of the formation of whose oxide is at a given temperature greater than that of titanic acid; next supporting in bath in the presence of molten iron titanic acid, and developing in the charge a temperature sufficiently high to insure requisite reaction between reducing metal and oxygen of titanic acid leaving liquefied metallic titanium to become alloyed with liquefied iron.

CONCENTRATOR.—No. 648,458; C. Galvan, Zacatecas, Mexico.

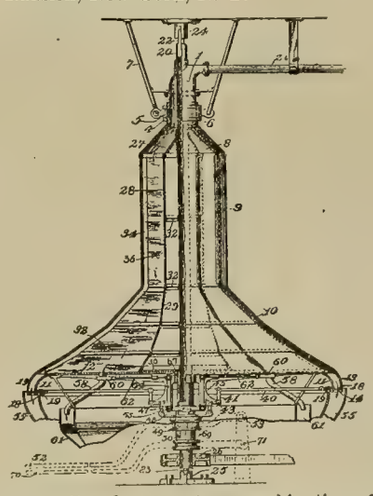


A concentrator having an ore-feed device, a concentrating table, a table-supporting frame adjustable vertically toward and from ore-feed device, a pulley on frame, means for vibrating table by rotation of pulley, a driving pulley journaled in stationary bearings, a belt connecting driving pulley with pulley on frame, tension pulley for belt, and an adjusting device for tension pulley, operated by adjusting movement of the table-supporting frame. A stationary driving pulley, belt connecting it with another pulley forming part of driving mechanism, a tension roller engaging belt, an approximately horizontal rack carrying tension roller, and an adjustable pinion engaging both racks.

PULVERIZING MACHINE.—No. 648,488; G. S. Emerick, Philadelphia, Pa.

A pulverizing machine, comprising lower supporting frame, grinding ring mounted thereon, upper frame resting on grinding ring, bevelled engaging surfaces arranged between frames and upper and lower edges of ring, bolts and springs for holding grinding ring in place between frames under yielding pressure, grinding balls engaging grinding ring, disk having ball sockets and driving arms, shaft carrying disk, step block supporting shaft in yielding manner to correspond with yielding action of grinding ring.

ORE SEPARATOR AND AMALGAMATOR.—No. 648,549; G. H. Cline, Jersey Shore, Pa.



An ore separator and amalgamator, combination of sluice box, open-bottomed earth-receiving chamber arranged at one end of sluice box and communicating directly therewith, furnace arranged at end of sluice box opposite earth-receiving chamber, having flue connection with latter, washing screen located within open earth-receiving chamber, exposed directly to water within sluice box, elevated sluiceway and conveyer arranged to work in sluice box, and so propelled as to impart impulses to water in direction toward screen for washing contents of latter; damper-controlled flues extending through sluice box at sides and connecting furnace to dirt chamber, damper-controlled uptake extending through dirt chamber and communicating with furnace flues, endless bucket elevator arranged in upright position between furnace and dirt chamber, operating in sluice box between furnace flues.

PROCESS OF MAKING STEEL CASTINGS.—No. 648,510; A. G. Lundin, Boston, Mass.

Manufacturing steel castings, heating steel scrap in furnace and melting same to substantially boiling point; inserting in molten metal a small quantity of copper; allowing sufficient time for the copper to become thoroughly melted and mixed with the molten metal; inserting in the molten metal a small percentage of ferro-silicon; allowing sufficient time for ferro-silicon to become melted and mixed with molten metal; inserting in the molten metal substantially simultaneously small quantities of ferro-manganese and aluminum; and pouring molten mass of metal or alloy into a mold in the usual manner.

CENTRIFUGAL SEPARATOR FOR ORES.—No. 648,711; H. De Raasloff, New York, N. Y.

In a centrifugal separator, combination of shell having a progressively increasing outward flare toward the point of discharge of solid matter, an inlet at one end and an outlet for solid matters at other end thereof, outlets for liquids separate from outlets for solid matter, blades in shell adapted to impart rotation to contents thereof.

COMPOSITION OF MATTER FOR FURNACE LININGS OR OTHER PURPOSES.—No. 648,756; R. Keck, Denver, Colo.

Artificial stone, consisting of magnesium material, and binder or flux consisting of material of shale occurring in the Jura-Trias along eastern foothills of the Rocky mountains, being porous and bad conductor of heat, in the proportion of about two parts of flux to three parts of magnesium oxide and calcium oxide contained in the magnesium material.

Geology of Butte Copper Field.

During the progress of the Colusa-Parrot-Anaconda mining suit in the U. S. Circuit Court in Butte, Montana, many facts have been brought out concerning the geology of Butte and her copper-bearing lodes, says the Anaconda Standard.

Prof. Shaler said if you could pull out, so to speak—fancy that you could pull out—all the veins in this camp, all the mineral matter, there would be an entangle of slender passages or great passages, from one end to the other, through which some small animal could find its way.

In his study of the Anaconda vein he found it to be a remarkably uniform and even deposit. It has two great central horses, but is of a singularly even constitution. No sooner was he impressed with the steadfast quality of the vein upon his first examination than he began to be surprised when he came in contact with what is known in the suit as the diagonal vein.

This is what has been termed during the trial as the blue vein. This Prof. Shaler found to be a huge brecciated vein, full of fragments of granite, with fragments of the Anaconda and Colusa-Parrot veins. Continuing his description of this blue vein he said: "I found that those fragments were in many cases shaken by violent strain; in many cases they have been rounded and bruised—in other words, this part of the vein was the seat of great violence. I found that from the granite walls the vein fragments, evidently separated by vertical fissures, had settled down into the cavity of the fracture. The walls were heavily grooved in more than one direction, showing divers motions on the planes of this vein. I found, further, whenever I struck this vein or came up to it in a crosscut or drift, or any intersecting gallery or shaft, a set of peculiar conditions. Going along with my candle I could see I was coming to this blue vein 50 or 100 feet off by the quality of the clay which had tumbled out on the floor, the clay being often piled 2 or 3 feet high."

A matter of some interest he found in several places was that he could hear the actual gurgling of water through the vein from above; the vein was a place of very free downward passage of water, unlike the fact existing in other veins. But the most striking feature to him was the large amount of clay. While clay is also found in places on the foot wall of the Anaconda, for persistent occurrence it is far more common in the blue vein. He was satisfied that this was a fissure vein, representing a great rent.

He felt certain that the blue fissure is a continuation of the same one that crosses the mountains, the variation in line not exceeding 4° or 5°. "I would say that this extension of that fissure," said he, "has been evidently remarked by miners; they have seen that something was there, as a set of test pits have been run along the line, none of them profitable. They have seen, however, that there was something there to inquire into long before I had a chance to." Another reason why he believed it was the same fissure is because their width is approximately the same.

He said he had never seen a fault of this sort that did not have a great many spurs and parallel fissures. "You couldn't apply a strain of rock such as this was," said he, "when the strain was applied, full of joints and small veins, lines of weakness, without causing a great many local accidents.

"As to the filling of this blue or diagonal vein, for the most part," he said, "it consists of great slivers of the granite country rock. They reminded him of those great obelisk-like fragments which are found in the mountain notch referred to, where they stand up sometimes 100 feet, slender, column-like, flaky masses, that seem to have settled down into this opening. They are broken a good deal, the motion of the fault having ground them up more or less."

The clay he considered singular and characteristic, and has filled every place. Then here and there ore has been formed, apparently by the replacement of the rocks in the vein, though some of the ore in the vein, he said, has undoubtedly come from the breaking up at the intersected sections or ends of the once united Colusa and Anaconda veins.

THERE are fifty works in Russia where sulphuric acid is made. The importation of sulphuric acid was 36,000 poods (590 metric tons) in 1898, as against 10,000 poods in 1897. At St. Petersburg and in the western department sulphuric acid is made from pyrites imported from Scandinavia. Iron pyrites is subject to an import duty of 1 copek per pood. Iron pyrites containing over 2% of copper pay a duty of 2.75 copeks per pood for every unit over 2%. In 1898 the imports of pyrites amounted to 2,509,000 poods, all being of the class containing less than 2% copper.

Treatment of Copper Mattes in the Bessemer Converter.*

In reviewing the progress of the art in America, a description of the various members of the plant properly precedes any description of the process. There can be no doubt that the elevation of the tuyeres, whereby they were raised above the level of the first formed copper, and rendered readily accessible by a properly constructed wind box to permit of systematic punching, constituted the modification which led up to the ultimate success of the method. Though side tuyeres on the level of the bottom were inserted in some of the earlier forms of both fixed and movable converters, and elevated tuyeres had been used in the Darfee converter as early as 1864, and were at the very time of M. Manhes' investigations the subject of experiments in the Clapp–Griffith converter, nevertheless M. Manhes was probably led up independently to their adoption by the failure of all his predecessors to carry the concentration beyond the white metal stage on account of the chilling of the copper in the vertical bottom tuyeres.

The converters first designed by M. Manhes for the Parrot works were small, of the vertical type, with elevated tuyeres, but deficient in appliances for readily reaching the tuyere through the wind box for the purpose of punching.

In the next works, namely, the experimental plant of the Anaconda Co., provided with twelve stands and four remelting furnaces, the converters were also stationary, and were revolved by gearing worked by belts and pulleys. They were, therefore, relined in place. When this was found to be wasteful the converters were removed on carriages after the shell had been uncoupled at the trunnions from the air pipe. The raising and lowering of the converter was effected by jackscrews. In these early works three converters were coupled up with each remelter, and relining was done in place after the exhausted lining had been cooled down by drenching it with water. When working with high-grade mattes three shells in commission to one in active service necessitated three stands being in position, which would involve for a large output works of ungainly size. The plan of relining in place has, therefore, been everywhere abandoned. During these initial stages of the art Mr. Stalmann erected and ran for a time a Bessemer plant at Durango, Colo., on rich argentiferous ores and mattes, in part the by-product of lead furnaces. The losses in silver were heavy, owing to the presence of lead, and therefore the method was abandoned. He used the square converter with square body and trough-shaped bottom that goes by his name.

In the next large establishment started, that of the Boston & Montana Copper Co. at Great Falls, the melting furnaces, which were at that time tilting reverberatories, were ranged on one side of a central aisle and the converters on the other. An electric crane, traveling to and fro over and beyond the central aisle, transferred by ladle the matte from any of the furnaces to any of the converters, and carried the shells back and forward between the stands and the relining room. The tilting furnaces have since been abandoned for stationary regenerator reverberatory furnaces of large size and capable of smelting roasted ore into matte at the rate of from 125 to 150 tons per day. At the same works cupola furnaces of 300 tons capacity are in operation, which reduce first-class lump ore and coarse concentrates without roasting to a grade proper for converting. From these, as well as from the reverberatories, the matte is transferred, while still fused, to the converters, and remelting is saved. The six converters are modeled in all details after 15-ton steel converters, but are provided with elevated instead of bottom tuyeres. Though very much larger than the converters used in any other works, the charge blown is not greatly in excess of the normal, the increased size permitting of much thicker lining than is usually being employed. The converters have always been tilted by hydraulic pistons operating a rack and pinion, a method now everywhere adopted.

Much larger works are those of the Anaconda Co. at Anaconda, where fifteen converter stands have been erected, though twelve only generally carry active shells. The converter building could not be placed in sufficiently close proximity to either the lower or the upper smelting works to avoid the interposition of remelting cupolas. On one side of the large converting building the remelting furnaces stand on a platform above the level of the converters, one remelter to two stands. Both cupolas and converters can thus discharge their gases into the same large flue. On the other side of the wide aisle through which the electric crane travels with the empty shells and the slag pots are several tilting copper refineries, into which the ladle, handled by the electric crane, pours the copper delivered from the converters. In these furnaces copper is sufficiently refined to make smooth anodes for the electrolytic tanks. These tilting reverberatories differ little in shape or design from Bruckner's calciners. The first was, in fact, a Bruckner shell. An opening in front of the cylinder is made sufficiently large to admit the pole and rabble. The charge is poured from a door on the side into a ladle of sufficient size to hold copper for an anode, and is then transferred from this ladle to an anode mould, the whole operation being effected by mechanical appliances and the exact quantity per anode being thus secured.

The hood and horizontal flue with pocket for carrying off the gases and dust from the converters perform their work perfectly, and permit of the easy separation and removal of the crusts which form in the hood.

But before the starting of the new Anaconda plant the Montana Ore Purchasing Co., a corporation which, under the energetic management of the Messrs. Heinze, has grown from a mere sampling and purchasing mill into a large mining and metallurgical concern, had erected a converting plant with two stands, the shells being of the Parrot pattern, but moved on cars. They still use this type of shell, but have replaced the cars by a hydraulic crane.

These are the only Butte works provided with converting departments in operation, but the Butte & Boston Co. is now erecting a plant of two stands. It has decided to adopt the horizontal trough converter, or, as they call it, the "barrel" converter.

The Copper Queen management has investigated the trough or barrel type of converter at the works of the Societe Metallurgica d'Italia, Leghorn. Here small converters of this design, tilted by hand and capable of blowing up about 30 cwt. of copper from 33% matte tapped directly from the cupola, were seen to be making copper under a very low blast, and this type of shell recommended itself on that account as more economical than the vertical. The converters as designed by the Copper Queen Co. by Messrs. Fraser & Chalmers on the same lines were estimated to be capable of holding on an average five tons of matte. They proved to be so efficient and economical that their adoption was followed in the three other Arizona works which have applied the pneumatic method, and, as already stated, one of the Butte works has decided to use them in preference to the vertical converter. The argument in favor of the trough or barrel converter is that the metal covers in a thinner layer a larger area, and therefore there is never the same depth of metal to be blown as in the vertical converter. Moreover, when copper has been formed the converter can be tilted, as the tuyeres are on the same level and on one side only, and thus the air is driven only through the residual matte, and, therefore, not necessarily through copper already reduced to the metallic state. The trough converter as used at the Copper Queen, the Arizona Copper Co. and the Detroit Copper Co. are 8 feet in length by 5 feet 8 inches in diameter. They rest and are revolved on runners, and the blast is carried into the wind box through a pipe with detachable joints which occupies the position of a trunnion in the vertical converter. The cover is made as flat as seemed consistent with safety in lining, and the mouth projects straight from the center of the shell—a somewhat objectionable feature, as it involves blowing vertically instead of laterally into the hood, a structural detail, however, which can be remedied to suit each converterman's views. The trough converter, being so much longer and lower than the vertical or cupola converter, adapts itself more safely to removal on a car than the vertical form. The Queen and Detroit companies have been using a car provided with a hydraulic plunger, on which the shells can be rapidly raised or lowered.

(TO BE CONTINUED.)

*Condensed from a paper read by JAMES DOUGLAS before the London Institution Mining and Metallurgy.

How to Make a Cheap Clinometer.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER, California State Mineralogist.

Cut out the protractor in Fig. 2; paste it on a board as shown in figure. Attach a silk thread at the point B. Then attach a lead ball A to the lower end of the thread so that the thread and ball will swing like a plummet. Hold the upper edge of the board parallel with the plane of bedding of the strata under examination and the plummet line will bisect the circumference of the protractor and give the degrees at which the formation dips from the horizontal.

After the dip of an oil sand is ascertained by a clinometer the following table will show at what depth the sand should be reached by drilling a well a known distance from the outcrop of the sand.

For instance, as shown in Fig. 1, A is an outcrop of a bituminized bed. The clinometer shows that this bituminized bed dips 40° from horizontality. For 100 feet horizontal (A C) 40° will give a vertical distance (C D) of 83.41 feet. The slope of the ground (A D) is 5° from horizontality. By looking at the table 5° will give a vertical distance (C B) of 8.75 feet to 100 feet horizontal. Deduct this vertical distance (C B) from the vertical distance (C D) as follows: 83.41—8.75= 74.66 feet. Consequently a well 74.66 feet in depth will have to be drilled at B in order to reach the oil sand (A D). The following table shows the vertical distance for each degree of dip from horizontality, for a horizontal distance of 100 feet.

MINING SUMMARY.

ALASKA.

A. Nevins, Supt. Alaska-Juneau mine, at the head of Silver Bow basin, has gone up with fifty men to start work.

Charles D. Lane, the California millionaire mine owner, is preparing to engage in Cape Nome sluicing on a large scale. He is finishing six barges at San Francisco, each of which will have a donkey engine and centrifugal pumps on opposite ends, to be used to wash rich earth. A sternwheel tug is being fitted out, all to be taken north on the steamer Charles D. Lane, formerly the Irrawaddy.

The Chilkoot Tunnel Co. say they have assurances that next month the British Columbian Parliament will grant a permit to begin work on boring a hole through the huge mountain in Alaska after which the company is named, and that there will be no difficulty in obtaining a franchise from the Canadian Government for the proposed railroad to White Horse rapids.

The Treadwell mine on Douglas island is to be further enlarged this year. Preparations are in progress for the addition of 240 stamps, increasing the total capacity to 1120. The enlargement involves an expenditure of $750,000. The Treadwell has now 880 stamps in operation. The framework is in course of construction at Seattle, Wash., in charge of A. Mackay, constructing engineer of the Treadwell. He says he hopes to have this portion of the work completed by May 15th and that the stamp mill addition would probably be on the ground and in operation by November 1st. One million feet of lumber is being used in the construction of the framework, to be shipped north on the steamers Al-Ki and Santa Cruz.

C. W. Brandon left Nome City Jan. 14th with H. L. Blake, went from Nome direct to Nushigak—1000 miles—by dog team, from there to Kadiak by boat, thence southward on the steamer Bertha. He says the claims on Glacier, Anvil, Snow, Dexter and Buster creeks are the richest there. He says there is no question about the richness of the country, "but as far as that is concerned everything has been staked out within miles of Nome. I do not see how the vast number of people who are contemplating going there can find claims unless they buy out some cheap ones, for the owners of the claims that are paying well will not sell at any price, or else strike back into the interior, and that takes a whole lot of nerve. There were six new districts located this winter between Nome and St. Michael. They have not been prospected as yet, being merely staked out on the snow. Everyone is wild there over every rumor of a strike that reaches camp. When I left," he continued, "nearly everybody was stampeding to the Norton Sound country, where a rumor locates a bonanza strike on Christmas creek."

Mr. Brandon brought out over 500 letters with him from Nome citizens and a number of options on claims located at Nome. He is of the opinion that the camp is good for five years yet. He has been at Nome since November, 1898. He was the twenty-fifth man there, and said that it seemed to him that the claims were nearly all located then. "No," he said, "the people who go to Nome this spring will experience all kinds of trouble in getting claims,"

ARIZONA.

GILA COUNTY.

The Black Warrior smelter near Globe has resumed.

T. C. Stallo has about ten pounds of turquoise from the mines of Stallo & Olcovich, eight miles west of Globe. He has shipped ninety pounds of turquoise to his partner, B. Olcovich of San Francisco.

PINAL COUNTY.

The concentrating mill of the Ray Co. will start up May 25th. It is a complete plant, with twenty concentrating tables and power for as many more. The railroad between the mines and mill—six miles—is finished and daily trains are running.

YUMA COUNTY.

The Crosby-Ehrich syndicate of Colorado Springs, Colo., will put three dredges this season in the Potholes country. The dredges are now building at Yuma. Each dredge will cost $50,000, taking 110 tons machinery.

The Papago Copper Co., headquarters in Los Angeles, will develop its group of gold, silver and copper mines in the Mohawk mountains, 40 miles southeast of Texas hill.

Mgr. Luce has started his new concentrating plant at the Castle Dome lead mines.

YAVAPAI COUNTY.

The Congress mine workings are now 2525 feet deep. For two years the company has been operating a 100-ton cyaniding plant, at which only the roasting process is employed, a necessity owing to the character of the tailings deposit. The tailings have paid $5 a ton. The company operates a standard gauge 3-mile line of railway from Congress Junction, on the S. F. P. & P. to the mines. Four hundred men are on the pay roll.

At the Iron King on Decatur hill, near Jerome, W. A. Clark is still driving a tunnel to tap the Equator ledge.

The Gold Reef, East Gold Reef and Midgeon mining claims are bonded to Dr. Hendricks of Los Angeles for $100,000. A cash payment of $5000 was made.

CALIFORNIA.

ALAMEDA COUNTY.

The Yuba Electric Power Co. has applied for franchise to run lines through the county for transmission of electricity for power and lighting. The Yuba Co.'s power plant is on the North Fork of the Yuba river, near Dobbins.

AMADOR COUNTY.

At the Peerless mine, the Dispatch learns that the shaft is 210 feet deep, and is in ribbon quartz its whole width.

CALAVERAS COUNTY.

The tunnel at the Melones mine, Robinson Ferry, is in 2750 feet. When in 4300 feet it is calculated the ledge will be encountered.

The winze in the lower level of the Lockwood mine at West Point will be put down to a depth of 750 feet.

Citizen: The Lightner M. Co. at Angels has put in a 1000-foot wire cable and two 1200-pound sheaves.——The Green Mountain hydraulic mine near Mokelumne Hill is working with a full head of water. ——The mill run of the rock from the Commodore mine averaged $4 per ton.—— H. McSorley has a double shift working at the Camanche Co.'s mine near Camanche.

EL DORADO COUNTY.

S. R. Porter and others of Amador county have a bond on the Church mine, Mud Springs district, and will unwater and develop the property.

The Nugget says the pocket miners on the Georgetown divide are meeting with success. Over $50,000 was taken out during April, divided among several miners.

C. H. Dunton is again in charge as Supt. at the Larkin mine.

FRESNO COUNTY.

(Special Correspondence).—An interesting piece of work in placer mining is under way by the C. & S. Co. on the San Joaquin river at Millerton—the old county seat of Fresno. A. Cleghorn, the Supt., intends to turn the river by a 750-foot center and 200 head and foot walls. A water-wheel will be used to drain. About 400 feet of the center wall is complete. A complete prospect of the bed will be made by July 1st.

Coalinga, May 4.

The Kings County Oil Co. is going to bore a new well close to its old one, No. 1, in the Kreyenhagen district. Wm. Chatham, Supt. for the company, is in San Francisco for a new drilling outfit.

The California Rock Oil Co., which controls 120 acres of land in Oil City, is erecting derricks and preparing to bore two wells.

KERN COUNTY.

The Kern Oil Co. will have a spur built from the Southern Pacific branch line for loading cars near its wells.

The Brown Co.'s well on 27, 28, 29 is 1100 feet deep. The drill is in brown shale.

LOS ANGELES COUNTY.

Six miles east of Newhall the Pioneer White Oil Co. is going down 1000 feet.

MADERA COUNTY.

The strike in Grub Gulch by C. M. Ward continues to show as much gold as at first.

NEVADA COUNTY.

The Grass Valley Standard G. M. Co. has incorporated by S. A. White, T. F. McAvoy, J. J. McCormick, H. J. Thomas, J. Henan; capital stock $50,000.

The Beebe G. M. Co. has also incorporated. The directors are J. J. Blackburn, J. H. Coughlin, J. Hayes, W. H. and M. H. Weldon; capital stock $25,000.

The Home mine will soon build a 20-stamp mill on the property. D. McFall will have charge.

Japanese were imported to displace white men at the Poorman & Hastings mine, on the Middle Yuba river, 15 miles from Grass Valley, but the owners sent them back to San Francisco.

ORANGE COUNTY.

Drilling in the Soquel canyon is in progress; the well is down 450 feet.

The Union Oil Co. is now pumping, it is understood, at the rate of 100 barrels a day from a well which is only in the first oil sand.

PLUMAS COUNTY.

C. E. Ertz, who has charge of the Halstead mining property on the East Branch, will put in a sawmill and a 20-stamp quartz mill.

A quartz mill is being put up in Light's canyon for the Diamond M. Co.

SAN BERNARDINO COUNTY.

(Special Correspondence).—A group of gold quartz veins is being developed 7 miles south of Ludlow, a station on the A. & P.—the Bagdad—owned by Woodard, Suter & Co. Porphyry constitutes the country rock; the pay ore is 12 feet wide. W. R. Woodard of Randsburg is Mgr. and Cyrus Grant resident Supt.

One-half mile from the Bagdad, J. R. Gentry made a location last fall which has since produced considerable amounts. Five sacks of the ore shipped is reported to have netted $1300.

Green & Co. have bought several claims near the Gentry, employing a number of men opening the property.

San Bernardino, May 8.

Needles Eye: The mill being erected by T. Ewing, about 42 miles up the river, will be completed soon. It has a 20-stamp mill, and, with the one of like proportions a few miles farther up on the other side of the stream, will handle all the ore in that district.

SANTA BARBARA COUNTY.

There has been an assessment of $5 per share on the stock of the American Asphalt Co., or the Alcatraz Paving Co.'s branch of it. The latter is credited with being one of the very few concerns that ever beat the Southern Pacific Co. at its own game. It is the well-known policy of the S. P. Co. to put on "all the traffic will bear" and charge as much freight as it thinks will just save the producer from ceasing to produce. When the Alcatraz Company started to mine its asphalt deposit, 40 miles from the Santa Barbara sea coast line, the S. P. Co.'s branch road assumed that everything was coming its way, but the Alcatraz people built a refinery at the mine, put in a double pipe line to the coast, dissolved the asphaltum in naphtha, let it run by gravity down to the coast and pumped the naphtha back to the mine, the whole thing being conducted at a moderate cost independent of the railroad company. It is so seldom any California mining or manufacturing business escapes from the enforced necessity of paying tribute to the Southern Pacific that the occurrence is considered worthy of mention.

The well of the Southern Pacific Co. at Summerland, which at first produced about 100 barrels per day, has settled down to about twenty barrels.

SISKIYOU COUNTY.

Journal: The Yreka M. Co., working the Gold Ball or Klamath mine at Salmon river, is running a 20-stamp mill, with abundance of ore.——Fifty men are building a road from the Gazelle and Callahans road to the Dewey mine, west of Gazelle.

TUOLUMNE COUNTY.

The Arrastraville M. Co. has levied an assessment of 10 cents per share.

Democrat: The Arbona, Tuttletown, 10-stamp mill is in constant operation.—— The Mt. Zion mine, near Groveland, is to be bonded.——The Kanaka mine and mill now employ twenty-five men. —— The Horseshoe Bend property, on the Stanislaus river, is to be sold to Eastern men for $15,000.——At the Ferguson mine the tunnel has a total length of 1500 feet. The fine slate which was originally cut through in the old tunnel for the first thousand feet, is coming in again. The vein is 2½ feet in width, with a 12-inch streak of high-grade ore.——The Soulsby mine at Soulsbyville may soon be in operation. J. G. Hopper goes to Paris to submit facts and figures concerning it. The Soulsby covers 130 acres of ground.

VENTURA COUNTY.

The first prospect well put down near Rincon Point by J. W. Churchill, has reached a depth of 780 feet.

COLORADO.

BOULDER COUNTY.

Ward Miner: The Cold Spring M. Co. will put up a 100-stamp mill on Left Hand creek, near the mouth of their tunnel. J. M. Page is Mgr.

EAGLE COUNTY.

The Herald-Democrat says that the Newhouse tunnel, being driven into Battle mountain near Red Cliff, is now in 700 feet and is already draining the principal mines of that section. With air drills the men are cutting into the hill at the rate of 140 feet per month. Eventually the tunnel will penetrate the lime contact at 3000 feet in from its mouth and will then have a vertical depth of 1800 feet, tapping the contact on the dip. It is designed to reach and afford facilities for the drainage and development of 680 acres of ground controlled by the Newhouse syndicate. At the present rate of progress this object will be attained in about eighteen months. Its completion will be a great thing for the Eagle river country.

FREMONT COUNTY.

The National G. E. Co.'s plant at Florence has a daily capacity of 200 tons, being enlarged from a capacity of seventy-five tons, at an expense of $130,000.

Upon the erection of the new smelter at Colorado City the combined capacity of the plants managed by Tutt, Penrose & McNeill will be nearly 1000 tons per day, the Colorado - Philadelphia Reduction Works at Colorado City having a capacity of 350 tons, the plant at Florence 200 tons, and the new Standard M. & S. plant about 400 tons.

GILPIN COUNTY.

At the new mill being erected by the Boston & Denver M. & M. Co. at Black Hawk the eighty stamps will weigh 1000 pounds each. The mill will be running July 1.

The Avon 25-stamp mill on North Clear creek is running.

GUNNISON COUNTY.

H. S. Roe, Mgr. Cortland Co., is shipping three carloads of ore a month to the Pueblo smelters. The ore runs $100 a ton in gold and silver. Twelve men are at work on the main workings and contracts are in progress in various parts of the property.

The Calumet Co. is working a rich ore shoot and will soon commence shipping ore.

Near Ohio City, Gold Brick district, a vein of silver ore is being opened in the Magnet mine, carrying ruby, wire and leaf silver, with arsenical blendes carrying gold and galena.

LAKE COUNTY.

At Leadville the Revenue M. Co.'s shaft No. 1 at Rock hill is down over 550 feet and is in gray porphyry.

Miner: The Resurrection mine ships over the Klondike branch of the Denver & Rio Grande 200 tons per day. The new three-compartment shaft is down 400 feet. It will be sunk 1000 feet, 300 feet below the present workings. —— At the Iron Mask large bodies of sulphide ore have been opened in the lower workings and the values show increase in copper, returns giving 15%.

PITKIN COUNTY.

At Aspen, after being snowed in for three months, the Upper Durant and Tourtelotte Park mines have resumed shipments.

SAGUACHE COUNTY.

The San Isabel M. & M. Co., at San Isabel, 3 miles from Crestone, are putting up buildings and will build a $75,000 mill this summer.

SAN JUAN COUNTY.

In the Terry mill, near Silverton, the rolls are to be replaced by stamps. The capacity of the mill is seventy-five tons a day, and thirty stamps will be required.

SAN MIGUEL COUNTY.

Near Telluride the new 60-stamp mill of the Smuggler-Union M. Co. is in operation. There is a 4½-inch drop, ninety drops to the minute.

This week the Liberty Bell 40-stamp mill resumed, the cyanide plant below it now being finished.

TELLER COUNTY.

Last week J. F. Burns, Pres. Portland G. M. Co., issued orders to again resume work with a full force.

The Lucky Gus mine is reported sold to W. S. Stratton for $300,000.

The recent advance in the price paid for gold by the smelters to $20 an ounce affects all contracts, large or small shipments.

Post: As predicted, the output of Cripple Creek for the disastrous month of April was about one-third less than it was in the month of March. The extraordinary weather did it. The contest over treatment and railway charges may have had slight influence, but if so it is not enumerated. Snow storms began soon after the first of the month and there was little intermission between tempests to the very last day. Surface water deluged the mines, wagon roads were rendered impassable, railroads seriously impeded, and a shortage of production resulted. The chemical mills received 24,000 tons of ore, from which they extracted $665,000 gold. The different smelters received 10,000 tons of an average value of $75 a ton. The smaller reduction plants extracted $18,000 worth of gold; total value for the month, $1,433,000. The mill ore averaged $27.70 a ton. This is a remarkable exhibit if wholly correct. Consider the averages —$75 a ton for smelting grade and $27.50 for the milling product; it is without parallel in the world. Until Cripple Creek came in it has been unequaled in the annals of our State. If the weather during May shall be favorable the largest output of the current year will follow. All the ore bins at the producing mines are full and thousands of tons of high and low grade are broken and ready for hoisting when the decks shall have been cleared. It is reported that increased forces will

be placed in the Portland and the Isabella.

IDAHO.

Boise Statesman: J. W. Cunningham, Supt. U. S. Assay Office, has completed his report of the Idaho output of gold, silver and lead for 1899. It shows: Gold, $2,110,718; silver, $5,283,443; lead, $4,713,604; total, $12,107,765. The subjoined table shows the output of gold and silver by counties for 1899:

Counties.	Gold.	Silver.	Total.
Ada .....$	18,543	$ 336	$ 18,879
Bannock.	15,876	138	16,014
Bingham.	19,452	199	19,631
Blaine...	31,090	229,953	261,043
Boise....	393,902	7,345	401,247
Canyon..	10,873	113	10,986
Cassia....	18,088	88	18,176

ADA COUNTY.

Telluride is reported discovered by the Idaho M. & D. Co. 4 miles north of Boise.

LATAH COUNTY.

A large mica mine is on Mica mountain, 35 miles east of Moscow. A. Munro, Mgr. of a group of these mines, is credited with the statement that upon this mountain there is enough mica to supply the United States for twenty years. One sheet recently taken out, he says, weighed 100 pounds.

OWYHEE COUNTY.

Avalanche: The Dernier Resort M. Co. will operate three claims on War Eagle mountain, near Silver City.

SHOSHONE COUNTY.

A 100-drill air compressor will be put in by the Morning Co. at the mouth of Grouse creek, below Mullan, to be run by water. The tunnel from mill to mine will be 1½ miles long.

MICHIGAN.

News Bureau: Calumet & Hecla is opening a mammoth mine on the Osceola lode. They are now running seventy power drills in the five amygdaloid shafts, which is a larger number than is employed on any other mine of the district. There is a scarcity of first-class miners throughout Lake Superior copper and iron districts. Supply of second-class miners, trammers and rough labor is adequate to any probable demand for some time to come. Finlanders are coming to mines by shiploads. Five emigrant cars, packed to limit, reached Upper Peninsula last Thursday.

HOUGHTON COUNTY.

The Calumet & Hecla is expected to produce 100,000,000 pounds of copper this year.

The Osceola Co. produces about 12,000,000 pounds of copper annually.

The Quincy M. Co.'s output this year is estimated at 15,000,000 pounds.

The Tamarack M. Co. produces about 22,000,000 pounds of copper annually.

MONTANA.

FERGUS COUNTY.

E. W. King is general manager of the Great Northern Mining & Development Co. at Gilt Edge. The cyanide mill has a total length of 300 feet and is lighted by 100 lights. There is an ore driver 28 feet long. The ore from the mine is dumped into a large ore bin and carried by a conveyor from this bin to the crusher. One may regulate the ore from the bin to the crusher and after the ore passes through the crusher it is carried by an elevator to a dryer and then lifted to a large screen in the top of the mill, and what does not go through the screen goes into a set of rollers, crushed and lifted again. On the second floor there are six seventy-ton tanks each 28 feet in diameter and 3 feet deep. Two of these are emptied and filled each day, making an average sum of 140 tons daily. A two-ton car is used in filling the tanks, so arranged that by the use of liners that the car is filled, run out over the tanks, dumped, and run back, being carried on an endless rope. One man fills a seventy-ton tank in less than one hour. There are two solution tanks 12 feet in diameter and 5 feet deep; two settling tanks 14x4 feet and one dump tank 15x5 feet. There is an automatic regulator to the circulating pump and if the solution gets too low it will raise steam and if too high will shut it off. In the engine room there are six rows of boxes, eight compartments in each box. These compartments are all filled with zinc shavings and every morning the shavings are moved to the next box ahead, the principal part of the gold caught in the first two or three.

FLATHEAD COUNTY.

At Libby, the Snowshoe concentrator has started. The tunnel is now less than a thousand feet from the other side of the mountain, being 1800 feet in. The Snowshoe mine has an eleven-drill air compressor. Libby is the headquarters of the Pacific Northwest M. Co.; H. E. West, Gen. Mgr.

The West Fisher M. Co. has started its 10-stamp mill on the West Fisher and it will be kept running all summer. Mgr. Murphy has hopes of being able to keep it going through the winter months. When in operation the mill and mine will afford employment for thirty-five men.

MADISON COUNTY.

At Pony, the Old Joe mine is sold to W. W. Morris for $15,000; $3000 down, balance in two equal installments.

MISSOULA COUNTY.

Another strike is reported in the tunnel of the Granite mine. Two feet of the ledge runs $100 a ton in gold.

Messrs. Tebbets of Spokane and Porter of Helena have bonded in the Wallace district a group including the Bullion, Cape Nome, Boston, Moose, New Queen and a half interest in the Empire, Union Eagle and Sleeping Child, for $100,000. It is understood that Messrs. Tebbets and Porter have closed another deal for the remaining half interest and they will at once proceed with the development of the claims.

SILVER BOW COUNTY.

The Pacific Slope M. Co. have decided to drift both ways on the lead, tapped at a depth of 200 feet by a tunnel 367 feet long.

The Anaconda Co. is locally credited with annually producing 120,000,000 pounds of copper.

The Boston & Montana Co.'s output is estimated at 75,000,000 pounds per annum.

The Parrot's output is estimated at 24,000,000 pounds annually.

The Colusa-Parrot and Anaconda mining companies have agreed upon a compromise order of the U. S. court relative to the operation of that portion of the ground involved in the lawsuit which has just been tried before Judge Knowles. By the terms of the agreement both parties are allowed to do certain work for the purpose of ascertaining more fully the truth or falsity of the allegations made in the course of the trial.

The order is in effect that upon the complaint giving security by bond in the sum of $50,000, conditioned that in case said temporary injunction shall issue, enjoining the defendants from the acts mentioned in the bill of complaint, that said complainant will pay to the said defendant so enjoined such damages not exceeding $50,000 as the said defendant may sustain by reason of the said temporary injunction in the event that it shall be finally decided that complainant was not entitled thereto; a writ of injunction issue restraining the defendants from mining in or upon what is known as and called the north or No. 1 Colusa-Parrot vein, in its descent into the earth and beyond the side lines of the Colusa-Parrot claim.

Provided, however, and it is ordered that notwithstanding the foregoing the defendant shall be allowed to make from the 600-foot level upon the vein in question one or two raises to the surface, said raises not to exceed two stope sets in size and shall also be allowed to crosscut or drift over to the workings of said vein now in existence or that may be made under the provisions hereof from the defendant's other workings; without, however, removing any more ore than may be necessary for the purpose of making connection or driving its workings to the vein, such drifting and crosscuting to be done only on levels; and that defendant may also run on said vein drifts or levels corresponding in elevation to the 200, 300, 400, 500, 600, 700 and 800 levels respectively to the Never Sweat levels, such levels to be not more than ordinary size and the number of such drifts or levels to be limited to seven.

Provided further, that the plaintiff shall have the right to run at least three crosscuts from the 300, 400, 500, 600, 700 and 800 levels of the Colusa-Parrot mine to intersect the No. 1 vein and shall have the right to make no more than four raises from the lowest of said levels to the surface and also the privilege of extending drifts on the said vein, corresponding in elevation to the 400, 500, and 700 Colusa-Parrot levels or the levels of the Never Sweat mine which are nearest to the said Colusa-Parrot levels to the east and west lines of the said Colusa-Parrot claims projected, and shall have the privilege of sinking three winzes from the 800 to the 900 Never Sweat levels in said vein or making three raises in lieu of said winzes from the 900 to the 800 of the Never Sweat.

It is also ordered that either party has leave to hereafter present an application to the court for an order to do other and further development work in and upon the said vein or for the purpose of developing the same, and for any other proper modification of said injunction.

It is also ordered that each party shall keep a correct account of the amount and value of all the ore extracted in the doing of the said work.

NEVADA.

ELKO COUNTY.

The Baltimore group, 23 miles north of Elko, Merriam mining district, have been bonded to A. H. Tarbet of Salt Lake City on a basis of $49,000. The ore is a carbonate and silicate of copper.

ESMERALDA COUNTY.

Messrs. Sutherland and Elliott at Candelaria say that tests of the tailings are satisfactory. A plant will be put in.

The Vulcan Copper Co. at Siegelville has fifty miners at work drifting on the 200-foot level. As soon as the new hoisting works are completed the three-compartment shaft will be sunk several hundred feet deep. The ore averages 4% in copper, besides low values in gold and silver. The smelter is being reconstructed into a reverberatory furnace. The company owns the Columbus coal fields and has ten men at work developing the veins. There are six outcroppings of coal on the property. The coal will be used raw in the smelter.

The ore tailings at Belleville are said to contain $400,000 gold value.

LINCOLN COUNTY.

A tunnel to tap the ledge at a greater depth is to be run on the DeLamar.

STOREY COUNTY.

At a meeting of mining men interested in the Comstock properties in San Francisco this week were opened the bids for pumping out the mines that work might be resumed in the lower levels. Twenty-six of the mining companies were represented. The bids ranged from $75,000 to $227,000. The work to be accomplished was the pumping out of 600 feet of water from the mines and raising it so that it would run through the Sutro tunnel, making it possible for the mines to be worked for ten years in the lower levels. The bids were finally rejected. The meeting decided to arrange the surface machinery to be ready to start with electrical power when supplied.

WHITE PINE COUNTY.

Hamilton, famous in the days of the White Pine excitement, is shipping more lead ore than any other camp in the State, except Eureka.

NEW MEXICO.

GRANT COUNTY.

The Santa Rita Co. have completed their leacher at Santa Rita. It is composed of eight tanks; the process by which the ore is treated will allow the running of copper ore that only runs 3%. The process used in the leaching method of treating copper ore is by the use of acids. The ore is first crushed, then run into one of the large tanks and covered with sulphuric acid, which gathers up the copper in the ore; then it is run into another tank, and so on, finally being run onto iron for precipitation.

RIO ARRIBA COUNTY.

(Special Correspondence).—Near Espanola, on the Denver & Rio Grande Ry., the Chama river empties into the Rio Grande. On the Chama, about 25 miles above its mouth, are 1700 acres of placer grounds belonging to the Rio Arriba Placer M. Co., composed of Kansas City parties. These lands lie on both sides of the Chama and are about 8 miles above Abequiu, at about 6000 feet altitude. The stream flows, it is estimated, from 80,000 to 100,000 gallons of water per minute. It is claimed the banks and bars are rich in placer gold associated with and contained in the black sand, and the depth of the workable material is from 20 to 40 feet from the surface to bedrock. The gold particles are extremely fine and a sufficiently close saving cannot be made by the usual hydraulic methods. A dredger was built on the ground and it is stated another and larger one will be built. The company above named has leased 900 acres to the Rio Chama Gold & Copper Co., made up largely of St. Louis people, whose plans contemplate devices for concentrating the black sand and other firm material bearing the gold and putting up a smelter on the Chama to reduce the concentrates and extract the values.

Espanola, May 4.

SANTA FE COUNTY.

(Special Correspondence).—The Magdalena M. & S. Co., at Cerillos, started operations about thirty days ago, with Thos. Brown as president, R. B. Thomas general manager and L. S. Austin superintendent. It is smelting about fifty to sixty tons per day of ore. The principal tonnage comes from the Hardscrabble mine, near Magdalena, and consists of lead carbonates. The fluxing material, iron ore and lime, comes from the Glorietta mine, 28 miles from Cerillos. A small tonnage of high-grade gold, silver and lead ores is received from mines near Cerillos. Water and fuel are accessible, the Madrid coal mines being located 3 miles south of Cerillos. These coal mines, belonging to the Colorado Fuel & Iron Co., are at present closed down.

Cerillos, May 2.

SIERRA COUNTY.

(Special Correspondence).—The Black Range, trending north and south through Sierra county, is attracting much attention. There is more activity than usual in prospecting and developing. From Grafton northward the ores are silver and gold; from Grafton to Hagan's Reak they carry gold and silver, with the addition of copper. It is claimed the best ore runs about 1 ounce gold, 100 ounces silver and 5% to 20% copper; the workings are not to any great depth. The gold occurs in quartz in sulphide form; the silver is found in chlorides and sulphides; the copper in carbonates and bornites. Water and timber are abundant. The altitude ranges from 6000 to 6500 feet where the mines are located. Present development extends along the eastern slope of the range, 8 to 10 miles east of the summit. One mill is operating at Chloride and another at Grafton. Those properties best developed are the Ivanhoe, Braxton, Emporia, Wathena, Great Republic, Keystone, Gold Reserve, Eureka and Readjuster. Also, near Chloride are the Hoosier Boy, Nana and Arbothnot. The Grafton mill is being increased to a capacity of forty tons per day.

Active steps are being taken to secure the building of a railroad line from Magdalena to Chloride, Fairview, Grafton or other points in the Black Range foothills.

Embudo, May 4.

TAOS COUNTY.

(Special Correspondence).—The Copper Hill M. Co., of which J. K. Turner is manager, are developing a mine about 12 miles northeast of Embudo, having just completed a 60-ton concentrator. The ores are oxides and sulphides of copper, also carrying good values in gold and silver. They are putting in a water line, comprising 3 miles of ditch and 16,000 feet of iron pipe, through which a water supply is brought from the Rio Grande to the property. Metallic pipe was used for part of the line because a ditch through some of the porous ground would not hold water.

Chloride, May 3.

OREGON.

BAKER COUNTY.

The Red Boy M. Co., Granite district, proposes to sink a shaft 2000 feet.

GRANITE COUNTY.

The Blue Ribbon group, six miles from Granite, is bonded by G. Kislingbury and P. J. Donahoe.

UTAH.

BEAVER COUNTY.

Tribune: The Horn Silver, at Frisco, has marketed another lot of ore that showed 26% copper, fifteen ounces silver, 15% lead and $1 in gold per ton.

MILLARD COUNTY.

The Orizaba group, 10 miles from Black Rock, furnishes ore running 9% copper, in addition to small values in gold and silver.

SALT LAKE COUNTY.

The annual meeting of the Shawmut M. Co. of Bingham, Utah, will be held at Salt Lake City next Monday. Secretary Barnes says the company has in the Crown Point the longest shoot of ore and the highest grade in copper known to exist in the Bingham district. The vein shows ore assaying $4 gold, 2.6 ounces silver and 11.6% copper—$28.70 per ton. The U & I No. 2 tunnel is in about 600 feet and the vein has widened out to 47 feet. Cuba No. 2 tunnel with crosscut tunnel is now in about 1250 feet. Total number of feet of work done exceeds 4000, of which about 2500 feet are on the vein.

Tribune: A new scale of wages at the plants of the American Smelting & Refining Co. in Salt Lake valley went into effect on the 1st, an advance of about 12½%. The lowest wage paid under the new schedule is now $1.55 for eight hours' work, as compared with $1.40 under the old one. There are about 700 employes.

WASHINGTON.

FERRY COUNTY.

At the Golden Harvest mine, Supt. Gauthier is driving a tunnel 1000 feet on the vein; it is in 400 feet. Here a device

has been arranged to run a water wheel, which will be used to drive air into the tunnel.

At Republic, at the Mountain Lion mine, twenty men are employed, twenty stamps crushing eighty-five tons per day.

At Republic a steam hoist and pump will be put in by Mgr. Lilienthal on the Gold Ledge mine.

FOREIGN.

BRITISH COLUMBIA.

E. Mansfield, representing English and French capital, has bought the outstanding shares in the Joker mine at Camp Mansfield. The whole price of these shares was about $100,000.

Sandon, the second mining town of importance in the Slocan, was destroyed by fire on the 4th, and nearly all of its 1200 people are homeless and nearly ruined.

Vancouver reports that at Texada island Messrs. Prescott & Scott of the Union Iron Works are building wharves and installing a plant to work the iron mines on the island, which is midway between Vancouver and Victoria, and will ship the ore direct to San Francisco. The ore is said to go 68% iron.

Rossland reports for the week ending May 5 the amount of ore sent to the Northport smelter 3344 tons from the Le Roi.

Appended is a statement of the shipments for the past week and year to date: Le Roi, week, 3344 tons; year, 21,230.5 tons; War Eagle, year, 10,603 tons; Center Star, 7017.5 tons; Iron Mask, 1434.5 tons; Evening Star, 356 tons; Monte Cristo, 273 tons; I. X. L., 224.5 tons; Giant, 42 tons.

In the Slocan there are 300 men on the payroll of the Slocan Star, Payne and Last Chance.

The Minnesota Silver Co. will build a concentrator near Sandon this summer.

THE KLONDIKE.

A letter from Dawson, dated March 28, says: "Many claims are shutting down on account of inflowing water, and, unless it turns cold, many persons will be out of employment until it thaws enough to commence sluicing. The past two weeks the weather has been mild, and the snow having nearly disappeared, freighting on sleds is being done at night and early morning before the sun gets warm. Wagons are scarce and a good new one will easily bring $750 or $800. There are plenty of horses, 200 head having just been brought in. They were brought over the ice, drawing loads.

"The mountains are bare on the south slopes and much water is going to waste. It is estimated that the early thaw is doing $100,000 damage a day to this district. If too much water does not go to waste, this country will turn out more gold than it did last year.

"Many of the best claims on Bonanza, El Dorado and Gold hill are about worked out, but Dominion, Sulphur, Gold Run and others will make up the deficit. Sulphur, Dominion and Gold Run are not really in the Klondike district, but the road leads up the Klondike river there over the divide. Dawson is the supply point.

"Horse feed is scarce; it costs $3 per meal for a horse, while you can get a good meal for $1. We pay $22.50 for ninety pounds of hay, while rolled oats for our own use is but 20 cents per pound.

"We started a short time ago for Forty-mile post, with three horses and six sleds, leaving here at midnight. We expected to buy three tons of hay we knew was there and haul it to Dawson; but, when half way there, we found the trail so sliding and rough and liable to slough off into the open channel that we abandoned the enterprise. Returning, we boarded at Travelers' Rest Hotel for about a week at $6 per day for two. Then we bought a cabin near the government barracks.

"We do not know yet whether we will go to Nome. The steamboat company offers tickets to St. Michael on barge, in tow, for $50; on steamer, with stateroom, $100. In either case one boards himself or takes meals on the steamer at Dawson prices. Most of the boys will go in their own boats."

Dawson advices to April 12 give $18,000,000 as approximate estimate of the clean-up for the Klondike district this spring. A great part of the washing is being done with rockers, in consequence of the failure of the water supply for sluicing.

Catalogues Received.

PART III, Ericsson Series, is received. This series has a good deal of illustrated telephone information and pointers as to practice. The Ericsson Telephone Co., 296 Broadway, New York City, will send a copy of the series on request.

"RIEDLER PUMPS" form the subject of Catalogue No. 24, sixth edition, issued by Fraser & Chalmers, Chicago and London. This 200-page pamphlet, with rounded corners and linen binding, profusely illustrated and full of technical matter, is a good treatise on moderm pump manufacture and use, and the entire subject is splendidly presented.

Personal.

WM. BALL is the new Supt. Lower Mammoth mine, Eureka, Utah.

PROF. G. E. BAILEY is Supt. Adele M. Co., Lewiston, Trinity county, Cal.

ANDREW MAYBERRY is the new Gen. Supt. U. S. M. Co., Bingham, Utah.

E. W. KING is Gen. Mgr. Great Northern M. & D. Co., Gilt Edge, Montana.

JOS. DEDERICH has returned from Republic, Wash., to Salt Lake City, Utah.

D. B. HUNTLEY has returned to De Lamar, Idaho, from an extended Eastern visit.

FRED'K BUTLER succeeds J. H. Baker as Supt. Geyser-Marion mine, Mercur, Utah.

DR. CABELL WHITEHEAD, assayer of the Bureau of the Mint, has gone to Cape Nome.

H. A. COHEN, Gen. Mgr. for Capt. De Lamar, last week visited the Bully Hill mines at Sallee, Cal.

J. H. STRITE has gone from Redding, Cal., to Moffat, Saguache Co., Colo., to erect a 20-stamp mill.

R. C. CHAMBERS has returned from San Francisco to Park City, Utah, to resume work on the Daly-West.

THOS. HANNAHAN succeeds C. W. Betts in the superintendency of the Brownlow mine, Park Co., Colo.

WM. KIDDLE, formerly of Clifton, Ariz., is in charge of the Santa Rita Co.'s leaching plant at Santa Rita, New Mexico.

B. DELARAY, late Supt. Melones Co., Robinson's Ferry, Cal., goes from San Francisco on May 25th to Cape Nome.

PROF. APPLEBY of the University of Minnesota, is touring Colorado mines, accompanied by thirty of his students.

W. F. KANE, formerly Supt. Republic cyanide plant, Republic, Wash., is now Supt. Franklin G. M. & M. Co., Julian, Cal.

A. C. FLUMERFELT is the new Mgr. Granby M. & S. Co., operating in the Boundary and Kootenay countries, B. C.

T. H. OXNAM, Supt. Bully Hill mines, Sallee, Cal., has resigned and gone to Los Angeles to engage in mining business for himself.

DAVID KEITH of Utah was in San Francisco when he heard of the Scofield disaster, and promptly wired $1000 to the relief fund.

W. H. STORMS, State Mine Examiner, goes from Calaveras to Mariposa county next week, and thence to the northern part of the State.

HERBERT DEAKYNE, Capt. Corps of Engineers U. S. Debris Commission, has returned to San Francisco from an official visit to El Dorado Co., Cal.

W. B. DAVIS succeeds Supt. D. McFall as Supt. Texas mine, Nevada Co., Cal. The latter will devote his sole attention to development of the Home mine.

HAMILTON SMITH, representing the London Exploration Co., left London for San Francisco on the 5th and is expected in California about the 21st inst.

B. N. SHOECRAFT, formerly of Nevada Co., Cal., is Sec'y Champion, Spanish and St. Gothard M. Cos., with offices at 113-114 Crocker Bldg., San Francisco.

AUSTIN BROWN of Butte, Mont., succeeds T. H. Oxnam as Supt. Bully Hill mines at Sallee, Cal. His postoffice address is Bully Hill mines, Redding, Cal.

ROGER KNOX of Independence, Mo., has arranged to start and superintend the Revenue and Monitor mines, Madison Co., Montana, which will be worked together.

C. R. BROWN succeeds J. L. Parker as Supt. North Star mine, East Kootenay, B. C. Mr. Brown had been acting as agent for the company at Great Falls, Mont.

W. C. RALSTON, Pres. California Miners' Association and Vice-Pres. American Institute Mining Engineers, is expected in San Francisco from Boston, Mass., next week.

C. S. BATTERMAN, Supt. Boston & Montana and the Butte & Boston, is in San Francisco, en route to Butte, Mont. The two mines of which he is superintendent employ 3000 men.

S. J. SULLIVAN of Leadville, Colo., is now manager of mining property at Santa Eulalia, Mexico. J. W. Phillips of Leadville goes in similar capacity to the Helena M. Co., Cusihuirachic, Mexico.

JEWETT SCRANTON has been appointed by the Mountain Copper Co. Supt. of the newly acquired Balakala, Cal., copper properties, in addition to his superintendency of the Stowell and Windy Camp properties, Shasta Co., Cal.

MGR. W. S. NOYES of the Presidio M. Co. of Shafter, Tex., in which Gen. Shafter is largely interested, is visiting San Francisco. He has been successful in the United States and State Courts over Chicago men, who claimed the company's property through a forged Spanish land grant. The suit cost the company $27,000.

J. H. PRYOR, special agent General Land Office, is investigating the recent difficulties between the Mountain Copper Co. and the miners in Shasta Co., Cal., regarding attempted acquisition of mineral land under agricultural application.

J. D. MORGAN, in San Francisco from Nome, Alaska, says he and seven others bought eight claims, each 1320x660 feet, on El Dorado creek, Bonanza mine district, near Nome, for $40,000, and that he got 40 cents to the pan just below the surface.

JOHN HAYS HAMMOND has got through his inspection of Cripple Creek and Aspen, Colo., and is expected in California next week. During his Colorado sojourn, the Denver dailies have credited Mr. H. with having offered $40,000,000 for the Portland mine, discovered diamond fields in Pitkin Co., etc. Mr. H. is this week at Coronado Beach, San Diego Co., Cal.

M. C. BROWN, recently appointed district judge of Alaska, is in San Francisco en route to Sitka. His jurisdiction will extend over the entire territory of Alaska —one-fifth of the area of the whole United States—the largest jurisdiction entrusted to one man in the world. In going to Cape Nome, which is 2000 miles beyond Sitka, his headquarters, it will be necessary for him to return to Seattle, 1100 miles, to get a steamer for Behring sea, unless he should be sent to the Cape on a revenue cutter. From Seattle he will then have over 3000 miles of ocean voyage to make to reach his destination. He figures that it will require at least eighteen months to complete his circuit, paying one visit to each town.

Obituary.

CAPT. THOMAS MEIN.

Capt. Thomas Mein died at his Oakland, Cal., residence on the 4th inst., aged 62 years. He was born in Jedburgh, Scotland, April 1st, 1838, came to California in 1853 and mined in Nevada county. In 1884 he went to Venezuela as manager of the El Callao mine. Returning in 1889, he assumed the management of the Alaska-Treadwell mines on Douglas island, Alaska. Thence he went to South Africa in February, 1892, where he acted as general manager of the Robinson mine, taking prominent part in the Uitlander imbroglio that was the precursor of the present war. He returned to Oakland, Cal., in 1896, and during the last four years had been more occupied with attempts to limit the circle of his business engagements than to acquire new interests, though at the time of his death he was consulting engineer of the Alaska-Treadwell G. M. Co., the Alaska-Mexican G. M. Co. and the Alaska United G. M. Co. of Douglas island, Alaska; president and consulting engineer of the Alaska-Juneau G. M. Co. of Juneau, Alaska; the Oneida G. M. & M. Co. of Sutter Creek, Cal.; the Steeple Rock Development Co. of New Mexico, and the Mariposa Grant of Mariposa county, Cal.; principal owner of the Commodore G. M. Co. of Siskiyou county, Cal., and a director of the Alaska Exploration Co. He was a typical representative of the California mining man, of large affairs, world-wide renown, a man whose prestige was coupled with success in large undertakings, and who filled a most prominent place in the annals of mining in this country. His wife and two sons, R. M. and Wm. W., survive him.

Industrial Notes.

—The steamship Samoa sailed from Baltimore last Saturday for Vladivostock, Russia, carrying the largest shipment of steel rails ever sent from the United States to a foreign country, 8640 tons, invoiced at $21 a ton.

—There is a complicated system of weights and measures in use in the Philippine Islands. The unit of weight for hemp, sugar, copra and grain is the picul, which is equivalent to 139.4674 pounds, United States standard, and the picul is divided into 100 cates. Grain is also sold by dry measure. The standard is the cavan, which is equivalent to 68.1 United States quarts or 2.13 bushels. The cavan is made up of twenty-five gantas (2.724 quarts each), which in turn contain eight chupas (22.88 cubic inches each) of four aptanes each (5.644 cubic inches in each aptan). Tobacco and ramie are sold by the quintal, in bales of two, three or four quintals each. The quintal is equivalent to 101.41 pounds and is divided into four arrobes of 25.35 pounds. Oil sells in tinajas or jars of sixteen gantas each, the tinaja holding about 50.71 quarts and the ganta being equivalent to 3.17 quarts.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING MAY 1, 1900.

648,478.—AWNINGS—W. H. Arnold, Oakland, Cal.
648,720.—EXCAVATOR—G. W. Barnhart, S. F.
648,830.—PEN EXTRACTOR—J. D. Barrie, Los Angeles, Cal.
648,377.—RANGE FINDER—C. J. Beauvais, Phœnix, A. T.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PORTABLE ADJUSTABLE VESSEL-LOADING DEVICE.—H. C. Holmes, San Francisco, Cal., assignor to R. D. Chandler of same place. No. 648,630. Dated May 1, 1900. The object of this invention is to provide a device for the loading of vessels from wharves, and it is particularly adapted for the purpose of discharging wagons or carts directly upon a vessel's deck or into the hold. It consists of an extensible driveway comprising the sections, one of which is slidable with relation to the other, so that it may be extended for use or drawn in upon the other section for transportation. The supporting section has wheels under one end, and means for connecting the opposite end with a team or motor so that it can be moved from place to place. Suitable guide rollers are so arranged as to be turnable and relieve the friction of the sliding of the two parts of the driveway. Angle iron strips are bent at the ends of the side rails and form stops to prevent the vehicle wheels passing over the end of the driveway.

FOLDING CRATE.—Henry Wetzel, Alameda, Cal., and F. J. Shaw, Oakland, Cal. No. 648,645. Dated May 1, 1900. The object of this invention is to provide a crate or box which may be folded to small compass for transportation or storage, and extended into shape as a container and locked in its extended position. The sides and ends are made of spaced strips, vertical plates at the inner angles of the box or crate are hinged together along their meeting edges and have lateral extending sockets adapted to receive and support the end portions of the strips forming said sides and ends. A hinged top and bottom and hinged plates extend across and project beyond the adjacent edges of the top, bottom and sides, and said hinged plates have interlocking loops which are adapted to align and guided slide bolts are fitted to engage and interlock with said loops to hold the box in position. When the parts have been folded together they are retained in place by hook plates which extend over and engage with the opposite sides.

Latest Market Reports.

SAN FRANCISCO, May 10, 1900.

SILVER—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59¾c (1000 fine); San Francisco, 59¾c; Mexican dollars, 49c.

Commercial Paragraphs.

FLINT & LOMAX, Denver, Colo., have sold a 15 H. P. belted Triumph motor to the A. H. Wise Manufacturing Co. and a 30 H. P. belted Triumph motor to the F. McRay I. W. Co.

C. H. FISHER, representing the Risdon Iron Works of San Francisco, is at the Golconda mine, Bourne district, Baker county, Or., putting in an additional 10-stamp mill and four concentrators.

THE Link Belt Machinery Co. of Chicago has sold to the Goodman Manufacturing Co. the patterns, stock and good will of that part of their business known as the electrical mining machinery department.

THE Denver, Colo., office of the Edward P. Allis Co. has a contract with the Colorado & Southern Railway Co. for three Reynolds Corliss engines and four 150 H. P. boilers for the new shops of the company.

PROF. C. L. CORY of the College of Mechanical and Electrical Engineering of the University of California, at Berkeley, Cal., has become an associate member of the engineering firm of Benjamin, Hunt & Meredith of San Francisco. This combination of engineers, formed one year ago, already occupies an important position in the engineering field on this coast. A. M. Hunt, the senior member, is the chief engineer and Gen. Mgr. Independent Electric Light & Power Co. of San Francisco, on which work is rapidly progressing. This plant, when completed, will have a capacity of 30,000 H. P., and is intended to be the most modern and complete in the country; the Yuba electric plant of 15,000 H. P. has been installed; the Truckee River General Electric plant of 3000 H. P., and D. S. Cone's Red Bluff, Cal., plant of 1500 H. P. are in course of construction. Plans and specifications have been prepared for two other 4000 H. P. transmission plants. Numerous expert tests have been made on plants in operation in various parts of the State, and reports have been made upon twenty-six mining properties. The work completed in the past year, that now under way and that in contemplation represents an expenditure of over $10,000,000. The association of Prof. Cory with these gentlemen should add increased ability and popularity to this prosperous firm.

Recently Declared Mining Dividends.

Daly-West, Utah, 25 cents per share, $150,000 ..... May 15
Portland G. M. Co., Colorado, 2 cents per share, $60,000 ..... May 20

GATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

CHICAGO, ILLS., Jan. 18th, 1900.

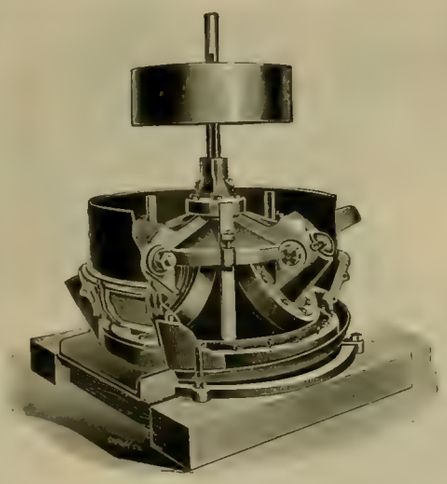
GATES IRON WORKS, CHICAGO, ILLS.

MY DEAR SIRS:—

Replying to your letter of the 17th inst., asking what we have done with the Tremain Mill at the Storm Cloud Gold Mines near Prescott, Arizona, in the past year, will say that we have been unable to run the Mill more than three days out of the week, owing to the fact that we have had, during the past year, but little rain. We were obliged to use settling tanks and save what little water we had, in order to run three days per week. The Mill has worked splendidly—in fact, it is a perfect little giant to do business with, where you have plenty of water for amalgamating purposes.

Enclosed I hand you a statement amounting to $20,210.72, which is the total product of the Mill for the twelve months, giving dates that we sent the bars to the mint at San Francisco and the amount we received for each bar.

I think the Tremain Mill is the best friend that a prospector or an individual who has practically a good mine can get hold of, to furnish him money to develop his property. I bought the Storm Cloud Gold Mines the last of June in 1897. In the fall of that year I bought, as you know, one of your Tremain Mills. From the day I started it it has paid all my developing expenses, and from the report made by the geologist of Arizona, December last, I now have $940,000 of ore blocked out, the expense of which has been paid from the net proceeds of the Tremain Mill. I have paid for over 1800 feet of development work with this Mill since I erected it two years ago last October. My experience teaches me that if anyone has any trouble with the Tremain Mill it is the fault of the man who operates it.



Yours very truly,

WHITING G. PRESS.

THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

THE : CAMMETT : CONCENTRATOR.
Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Up-to-date Miners who value their lives use

NO. 3 LAMP.

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored, where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

No. 1 weighs 2 lbs., 1¼ C. P.	Price complete, $4.50.	For meter reading only.
No. 2 " 3 " 4 "	" " 6.00.	For Miners and general use.
No. 3 " 12 " 10 "	" " 12.00.	For several persons to work by.
No. 4 " 3 " 4 "	" " 6.00.	Boiler Makers and Chimney Sweeps.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These Machines are Kept in Stock Ready for Immediate Shipment.

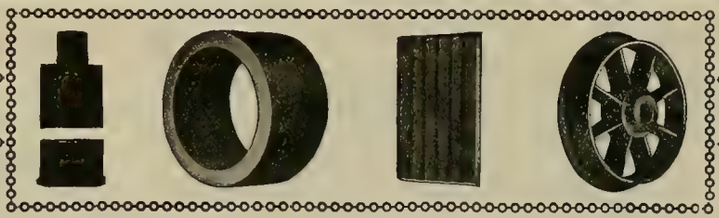
COMPRESSION OF AIR AND GAS.

The RIEDLER SYSTEM of Machinery for Air Compression is manufactured by FRASER & CHALMERS, Chicago, Ill., U. S. A., and London, England.



It satisfies the conditions of high efficiency and desirability in the transmission and application of power. By air compression, power is placed in a form available and elastic, safe and wholesome for nearly every kind of work. When highly compressed, air can be carried with very little loss for great distances and requires comparatively small and inexpensive piping. By reheating, its power can be greatly increased, using but a small fraction of the fuel needed to produce the same additional power by generation of steam. It has no such perils of explosion as steam, and (incidental to other uses) is a recognized resource for ventilation in mines.

Riedler compressors and blowing engines employ most efficient valves for air. These valves are opened and closed quickly and positively by aid of patented mechanism thoroughly proved in practice. Their use permits the most favorable speeds in the Corliss driving engines.

Other improvements on which patents are held by Fraser & Chalmers are embodied in the **EXPRESS RIEDLER COMPRESSORS,** by which specially high speeds are maintained with perfect results, obtaining a large power in a machine of small size, which may be direct connected to water wheels, high speed gas or steam engines, or electric motors.

Further particulars on application to

Address 762-17th Street.....East Oakland, Cal.

RICKARD & FROST,
ASSAYERS, 1752 Champa St., Denver, Colo. Formerly assayers at Argo smelter. Specimen, Control and Umpire Work. Prompt attention given to all mail and express samples.

Established 1879.
CHAS. B. GIBSON,
Chemist, Metallurgist and Mining Engineer,
81 CLARK ST., CHICAGO, ILL.

E. H. BENJAMIN, Mining Engineer.
A. M. HUNT, Mechanical & Hydraulic Engineer.
WYNN MEREDITH, Electrical Engineer.
EXPERT EXAMINATIONS. ADVISORY REPORTS.
CONSTRUCTION SUPERVISION
331 Pine Street,.....San Francisco, Cal.
Telephone Main 1870. Cable Address "Edben."

EDWARD L. HAFF,
MINING ENGINEER,
U. S. DEPUTY MINERAL SURVEYOR.
Mine Examinations and Reports.
National Annex Block,
P. O. Box 21. CRIPPLE CREEK, COLO.

ABBOT A. HANKS,
CHEMIST AND ASSAYER.
Successor to Henry G. Hanks, est. 1866. The supervision of sampling of ores shipped to San Francisco a specialty.
—531—
California Street,
San Francisco.

RICHARD A. PEREZ, E. M.
Assayer and Analytical Chemist,
120 North Main St., - Los Angeles, Cal.

S. W. TYLER,
Mining and Metallurgical Engineer,
6 Windsor Hotel Block,
Cable: Retyl, Denver. DENVER, COLORADO.

The SPOKANE BUREAU OF MINING,
N. E. LINSLEY, Manager.
SPOKANE, : : WASHINGTON.
Consulting Mining and Milling Engineer.
Will Examine and Report on Mines.

W. J. ADAMS, E. M.,
Mining Engineer and Metallurgist.
Graduate of Columbia School of Mines.
Author of "Hints on Amalgamation," etc., etc.
ROOM 14, 434 CALIFORNIA STREET,
SAN FRANCISCO, CAL.

CLARENCE HERSEY,
Assayer and Chemist,
(Established 1879.) LEADVILLE, COLO.
Gold, Silver and Lead.....$1.00.
Any two of above 75c; any one of above 50c.
Copper analysis.....$1.00.
Platinum, Nickel or Tin, each.....$5.00.
Twenty-one years successful experience in the mining metropolis of Colorado.
Write for mailing envelopes and price list.

ALMARIN B. PAUL, M. E.,
ROOM 27, CROCKER BUILDING, SAN FRANCISCO.
Will act as AGENT for the sale of RELIABLE Mining Property. SPECIAL AGENT FOR
MacArthur-Forrest Cyanide Process
for California north of and including Mono, Madera and Merced counties; also for State of Nevada. Will act as agent for Eastern parties owning mining interests in California.

F. H. HARVEY,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

Telephone Black 353.
W. N. JEHU,
ASSAY OFFICE and
Chemical Laboratory,
606 Clay Street (Ground Floor),
SAN FRANCISCO, CAL.
Ore Assays, Analyses of Minerals, Metals and Their Alloys, Etc.
Instructions Given in Assaying.

JOHN W. GRAY,
Mining and Hydraulic Work.
Prospecting Operations and Exploration Work.
Examinations, Surveys, Development, Equipment of Mines, Gold-Bearing Gravels, and Water Supplies.
923 Linden St.,.....Oakland, Cal.
Cable "Espra." Correspondence invited.

DAVIDGE & DAVIDGE, Attorneys and Counsellors at Law, Corcoran Building, Washington, D. C. Practice in the Supreme Court of the United States, the Court of Claims, the Courts of the District of Columbia, and the General Land Office. Western Union Code.

SAM'L A. RANK,
MINING ENGINEER,
U. S. DEPUTY MINERAL SURVEYOR.
Mine Examinations and Reports.

Brunton's Pat. Pocket Mine Transit.

1-3 ACTUAL SIZE.

The engraving herewith illustrates Brunton's Pat. Pocket Mine Transit as it appears when folded ready for the pocket.

The working parts are enclosed by an aluminum case, the outside dimensions of which are but 2¾ x 2¾ x 1 inches and the total weight but 8 ounces.

There are over two hundred of the above instruments in daily use at the present time, and those using them unite in pronouncing them the most convenient, accurate and reliable pocket instruments on the market. Send for Catalogue B to

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, mroe or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

ASSESSMENT NOTICES.

MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of April, 1900, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of June, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 25th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of May, 1900, an assessment (No. 5) of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 11th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—213 Jackson street, San Francisco, Cal.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 23) levied on the 2nd day of April, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

Parting Gold and Silver Bullion.

There are three methods of parting gold and silver: the nitric acid, the sulphuric acid, and the electrolytic process, respectively. The latter is well adapted to large smelting works. The nitric acid process is the oldest. It is thoroughly satisfactory, but the comparatively high price of nitric acid and the necessity of using either platinum or porcelain vessels has led to its being superseded in many modern refineries by the sulphuric acid parting process. Diluted sulphuric acid has no action on silver, but the strong acid, when heated, is decomposed by that metal, giving off sulphurous acid and forming silver oxide, which passes into solution in the excess of acid as silver sulphate. If gold is present in percentage, not to exceed one-third of the whole, strong sulphuric acid will extract the silver and leave the gold as a granular brown sediment. Should the bullion contain one-half gold, the latter metal will protect the silver against acid attack, and the result will be failure. It is the business of the refiner to adjust for the melting pot gold deposits with those of silver carrying small quantities of gold, or to add fine silver so as to have from two to three parts of silver for each part of gold. Such an admixture is melted in a large crucible, thoroughly mixed, and then, with a dipping cup, is poured into cold water. Most bullion contains varying quantities of copper, and this metal works very badly in strong sulphuric acid. While decomposing the acid with formation of copper sulphate, the latter, unlike the silver sulphate, is insoluble in oil of vitriol, hence, if present in any considerable quantity, copper soon acts as a protector to the bullion and the chemical action either ceases or becomes tediously slow. Besides apportioning the silver to gold, it is necessary, therefore, to so combine deposits that the granulations do not contain more than 6% to 8% of copper. The success of this process really depends upon the fact that while weak sulphuric acid rapidly dissolves iron, yet, if the acid be strong enough, it has no appreciable action—just the reverse of its relations to silver. Cast-iron vessels may, therefore, be employed. Large iron kettles are used, weighing half a ton, mounted over a furnace. Into this a charge of 300 to 400 pounds of granulated bullion is placed, and covered with three or four times its weight of acid—66 B. Heat is applied, when a lively evolution of sulphurous acid sets in, which, if too violent, must be checked by the addition of a little cold acid and slackening of the fire. This boiling is continued for several hours, during which time the escaping and consumed acids are gradually replaced. When the solution is complete the fire is withdrawn and the contents of the kettle allowed to quietly settle. A little cold acid is added to aid the precipitation of any suspended gold. Hoods over the kettles carry off the fumes to condensing and suppression apparatus. The strongly acid solution, while still hot, is siphoned off into the reducing houses. These are long, rectangular vats lined with lead, and provided with sloping covers. Slabs or ingots of metallic copper are placed on the bottom and sides of these vats, which are then partly filled with cold water. The hot silver solution is then run in, with resultant crackling and spluttering. The result is a weak solution of silver sulphate, rendered milky by the separation of fine crystals of that salt, the solubility of which is very slight in pure water. The copper immediately begins to precipitate the silver as a crystalline mass, easily detachable from the plates when the operation is complete. This requires about twenty-four hours. Meanwhile the copper has taken the place of silver, leaving a strong solution of copper sulphate (blue vitriol). This blue solution is drawn off for crystallization, and the spongy silver carefully transferred to leaching tubs for thorough sweetening with fresh water. The silver, now in the form of minute, flaky crystals, is compacted into cakes by means of hydraulic pressure and these cakes dried in a current of warm water, after which a simple fusion in a black-lead crucible without fluxes gives a bullion 0.998 or 0.999 fine. If silenium or tellurium is present in the bullion, it will pass into solution with the silver and be deposited with it by the copper plates. In this case the spongy silver will be dark colored and the melt will be brittle. It must then be fluxed with niter. The sulphate of copper is then carefully prepared for the market, the proceeds thus materially reducing the expense.

A BILL has been introduced in the House of Representatives by a Utah Congressman providing that work on an unpatented mining claim in excess annually of $100 in amount shall be considered as applying to adjoining claims held by the same owners. There is a good deal of well meant but ineffectual effort to secure favorable mining legislation in Congress, some of which, if directed to forwarding the bill creating a Cabinet position of mines and mining would be of practical value and definite result.

IN the U. S. Senate last week a long discussion was precipitated over the bill to apply a portion of the proceeds of the sale of public lands to the endowment, support and maintenance of schools and a department of mining and metallurgy in several States and Territories in connection with colleges, the benefit of agriculture and the mechanical arts, each college to receive $10,000 for the year 1901 and $1000 additional each succeeding year until the amount received by each college shall be $15,000 annually. Thus, it was pointed out, the measure appropriated $500,000 for the first year and $750,000 annually at end of five years. Eastern Senators opposed the measure.

IT is unpleasant to continually make adverse criticism of governmental rulings, but it would appear that a hide-bound system of bureaucracy is again being adopted at Washington in nearly everything relating to the mining industry. The Secretary of the Interior now rules that permits for cutting timber for mining purposes shall be given only to companies with paying mines. This rules out the prospector. It is enforcement of the rigid letter of the law, but in opposition to its spirit. The miners were not made for the law; the law was made for the miners. It was, of course, the intent to protect timber land from unlawful depredation. That is right, and the miner will gladly aid in its enforcement, but it is quite another thing to make so sweeping and arbitrary a ruling. This is not Russia, nor South Africa, and the prospector or individual miner trying to develop his claim has rights that no official can afford to disregard. Timber is a necessity to the miner. Heretofore the miner was allowed to cut enough off his location for necessary use in its development. The fairness and justice of this was universally recognized—even in the office of the Secretary of the Interior at Washington. Anything that can in reason be done to encourage the development of the mineral wealth of the country should be done, with due regard to the preservation and conservation of forest growth, but there is neither rhyme nor reason in the latest edict promulgated from government headquarters.

South African Mine Conditions.

The current issue of the London Mining Journal, commenting on the report of the leading gold property of the South African Rand, makes comment which, under the circumstances, is considered worthy of reproduction. Our London contemporary says:

The directors of the Robinson Gold Mining Co. have just issued their report for the year 1899, and considering its uniqueness in more than one respect it is an interesting document. For instance, there are items and figures in it which will not reappear in any future report, and as a relic of a memorable year in the fortunes of the company it will be worth preserving. Since October last the property has been controlled by the hostile Government of the South African Republic, but for the nine months ending September the profits were much larger than for those of any similar period in the history of the company, thus showing what an exceptional year of prosperity the company would have enjoyed had it not been for the interruption caused by the war. It is interesting to note the quantity and value of the gold seized by the Transvaal Government. The following table shows what was seized from the train on October 2:

	Bullion, Ounces.	Estimated value. £	s.	d.
Mill gold	5,700.460	20,730	0	0
Cyanide gold	1,228.700	4,410	0	0
Chlorination gold (own)	75.110	310	7	0
Chlorination gold (bought)	1,090.490	4,503	13	0
Total	8,094.760			
Insurance on above		86	18	6
Total		£30,040	18	6

The following was taken possession of at the mine on October 13:

	Bullion, Ounces.	Estimated value. £	s.	d.
Mill gold	1,736.000	6,520	0	0
Mill gold (samples)	57.000			
Cyanide gold	937.000	3,340	0	0
Totals	2,730.000	9,860	0	0

making a total of 10,824.760 ounces, of an estimated value of close on £40,000. This is a big item, but, in accordance with the usual practice, it was duly covered by insurance, but so far the insurance companies have refused to make good the company's loss. Altogether the net profit for the year amounted to £424,290, out of which the directors declared a dividend of 8s per share, equal to 8%, absorbing £220,000, leaving considerably over £200,000 to be carried forward. These improved results were due in a chief measure to the enlargement of the mill by another twenty stamps and to the replacing of forty stamps by those of a heavier type. Furthermore, a complete cleanup of the plates and all gold-bearing material in and around the reduction works was made before the war, and the value it realized has been included in the accounts. While there was an improvement of 3s 1.4d per ton in the recovery from the plates, there was a falling off in secondary treatment results equal to 3s 5.3d, without regard to revenue from slimes. The manager assigns the main reason for this deterioration in the greater tonnages of ore drawn from the eastern mine and in the steadily increased proportion of main reef leader over south reef.

On actual working expenses there was shown a reduction of 1s 4.6d per ton. Less money was spent on mine development than in the previous year, but sufficient milling ore was opened up to maintain the reserves at about the figures reached at the close of 1898, viz., approximately 750,000 tons, exclusive of main reef. An excellent amount of work was done during the nine months. Both main shafts are now down to the thirteenth level, and the work of cutting the stations thereat was well advanced when operations were suspended in October last. The ore hoisted amounted to 223,008 tons, of which 57,973 tons were sorted out as waste above ground; 165,444 tons were milled, while the full mill of 140 stamps ran 266½ days, crushing 4.429 tons per stamp per day, a slight improvement upon the previous year's work. At the cyanide works 116,130 tons of sands and concentrates were dealt with, the percentage caught relative to the tonnage milled being 70.2 as against 71.6% in 1898. The actual extraction was 77.2%, the same figure as in the previous year. Such, then, is the record of this great Rand mining company during 1899, and, considering the many difficulties and troubles which it had to face, it must be considered satisfactory. Long before the Boer ultimatum was issued the unrest in the Transvaal, engendered by the fears of the probable outbreak of war, had a most distracting influence on labor, causing an exodus of natives from all the mines. With respect to the company's future, it would be idle to indulge in prediction at the present time. In common with the majority of the other mines, great expenditure will be needed to restore the conditions of things prior to the outbreak of the war. But no one can forecast what that expenditure is likely to be, nor foretell when operations at the mine can be renewed. That we must leave to the future, and hope for the best.

Pending Mining Legislation.

The Alaska bill is not yet a law, and may not be enacted this session of Congress. It limits the field of free mining, cuts the beach into two parts, making mean high tide the dividing line. At Cape Nome "mean high tide" is more than half way up the beach to the tundra. Below this line are the "poor man's diggings."

Section 26 of the bill as it passed the Senate relates to beach mining. It is as follows:

The laws of the United States relating to mining claims, mineral locations and rights incident thereto are hereby extended to the district of Alaska; provided that, subject only to such general limitations as may be necessary to exempt navigation from artificial obstructions, all land and shoal water below mean high tide on the shores, bays and inlets of Bering sea within the jurisdiction of the United States shall be subject to exploration for gold and other precious metals by citizens of the United States, or persons who have legally declared their intentions to become such, under such reasonable rules and regulations as the miners in organized mining districts may have heretofore made or may hereafter make governing the temporary possession thereof for exploration and mining purposes until otherwise provided by law; provided further, that the rules and regulations established by the miners shall not be in conflict with the mining laws of the United States; and all permits heretofore granted authorizing any person or persons, corporation or company to excavate or mine under any of said waters are hereby revoked and declared null and void; and the reservation of a roadway 60 feet wide, under the tenth section of the Act of May 14, 1898, entitled "An Act extending the homestead laws and providing for right of way for railroads in the district of Alaska, and for other purposes," shall not apply to mineral lands or townsites.

Much of the difficulty and confusion arises from the placing of the line of "mean high tide." At Cape Nome there is only about 30 inches difference between high tide and low tide. Much of the entire beach on Seward peninsula has been pre-empted, and it is along this beach down to the tide line that those going there without capital or prior possessory rights may expect to work.

The one favorable thing from the miners' standpoint in the above excerpt from the proposed law is that it is with intent to give the miners themselves the power to regulate works in accordance with mining district laws as universally recognized in every mining camp anywhere in U. S. jurisdiction. Just what it can do with the manifestly fraudulent pre-emption of claims on the beach cannot be determined.

The bill is now before the conference committee of the House and Senate, but further action this session is problematical. The only thing that appears certain is vexatious conflict and ruinous litigation there this season.

DURING the week were held in Denver, Colo., annual meetings of the Western Federation of Miners and the Western Labor Union, the deliberations of each taking an unusually wide scope, the Federation going into the discussion of a resolution to accumulate by assessment a fund with which to purchase mines and establish a co-operative smelter, and the Labor Union appointing a committee to investigate the feasibility of establishing a university wherein could be instructed the sons and daughters of laboring men in political economy. It is not likely that either scheme will meet with immediate practical fruition.

WHEN the astute mine boomer now wants to sell a worthless mining property he "starts" a "mining paper" in Iowa or Illinois, buys a file of some old established mining journal to clip from, and give a "technical" aspect to the production, and in a few weeks announces that he has "the largest circulation of any mining paper in the world." When the mine is unloaded the paper ceases to exist, and the game goes on. The whole thing has the same relation to legitimate mining or legitimate mining journalism that the wrecker's flare along the beach has to the government lighthouse.

INDIAN ENGINEERING figures that the river Hooghly annually discharges 90,000,000 cubic yards alluvium and debris into the sea. Some of the California anti-debris lawyers and "mining engineers" out of a job might be able to start an "anti-debris" association up the Hooghly.

Questions and Answers.

Such questions as the following are usually answered in "Concentrates," the questions themselves being omitted to economize space, and the answer given in smallest possible limit consistent with accuracy and clearness. The following illustrate the scope and character of the questions received from every part of this west half of America, the names of the writers being omitted:

Information is wanted in regard to tungsten—how and where the metal is reduced, the uses and demand, the markets and prices for the ore or concentrates. You will thus benefit an industry in Colorado and the San Juan country, especially, that lies almost dormant. I am producing a concentrate containing 60% to 70% tungstic acid from hubnerite, a tungstate of manganese. One shipment went abroad and brought less than $300 per ton. Other shipments, through New York brokers, brought even less. Efforts have been made to find American buyers, American consumers or even American reducers of the mineral, without avail.

This is my first effort in behalf of the metal and the prospectors and miners of the San Juan to obtain information from the MINING AND SCIENTIFIC PRESS. Here in San Juan county hubnerite occurs in stratified streaks in the veins, true vertical fissures in trachyte. While the veins may be 4 to 8 feet wide, the tungsten streaks are from 4 to 24 inches and cling to one wall or the other, and the tungsten streak has no bases, such as lead and copper, mixed with its quartz gangue which makes up the vein filling, with gold and silver therein, but, wholly free and easily concentrated, the finer the mesh the higher per cent of tungstic acid in the concentrate.

Gladstone, San Juan Co., Colo., April 24.

Hubnerite is also found in considerable quantity in Mammoth and Osceola, Nev.; Ouray and Silverton, Colo.; Lead, S. D., and Dragoon station, Ariz. At the latter place it occurs in white quartz veins, containing little iron, having a manganese oxide base, of brownish-red color, in tabular prismatic blocks or thick plates, completely enclosed in the quartz, and varying in weight from 15 to 500 pounds. A carload of the ore was recently concentrated at the Arizona School of Mines with excellent results. It is a tungsten mineral resembling wolframite in composition, but containing 20% to 25% manganese oxide. The Osceola, Nev., deposit occurs in bladed forms, in color brownish red. It is shipped to Philadelphia, where it is made into tungstic acid, used in the manufacture of steel. It brings $300 per ton laid down in Philadelphia. Its importance is due to its hardness, which is greater than that of any other commercial metal, its high specific gravity—about equal to that gold—and its property of making steel self hardening. So far its sole use in this country is in alloying steel, and the supply exceeds the demand. There is little demand for it in this west half of America. We quote it at 75 cents per pound in New York City and $1 per pound in San Francisco. The manager of the metallurgical department of the Bethlehem Steel Works, Bethlehem, Penna., could give any detailed information required as to prices. It does not cost much to mine, but transportation charges from San Juan county would tend to hinder its profitable production in that region.

A scientific discussion of the subject in connection with steel alloys was published in the issue of Jan. 13, 1900.

Will "Concentrates" please answer the following?

First—What, if any, loss would there be in retorting amalgam in an open crucible?

Second—What effect would babbit have on amalgam if put in a mortar of a stamp mill?

Rochford, South Dakota, May 4.

If amalgam is retorted in an open crucible there will certainly be some loss experienced. The larger the lot, or where there is more of the quicksilver remaining in the amalgam, the more liability to loss, for upon too rapid heating small explosions will occur, blowing out some of the amalgam.

When babbit metal gets into the mortar of a stamp mill, among the ore, it will become ground up and amalgamated with the other fine metals in the ore, the principal effect being to reduce the fineness of the amalgam by such additions of base metals.

I forward you a sample of stibnite running high in antimony. We have a large body in sight. I would like to know where this ore can be handled to the best advantage, what net amount of money can be got for it, etc.

Ritzville, Wash., April 20.

Chapman & Co., 422 Battery street, San Francisco, Cal., or Mathison & Co., New York City, can correctly answer all inquiries regarding value of antimony. Stibnite carrying say 50% antimony ought to be worth $45 per ton f. o. b. at Ritzville.

Tell me through "Concentrates" the best method of separating the fine gold from the black sand. We are preparing to handle Snake river sand.

Lewiston, Idaho, April 28.

Articles innumerable have appeared through the years on this subject. One of the best illustrated notices thereof was published in the issue of May 15, 1897.

I want a good, extended account in detail of how to refine base lead bullion containing silver and gold, something that goes into the thing throughout the entire process.

Leadville, Colo., April 20.

G. H. Blakemore, in charge of one of the largest establishments of that kind in the world, wrote an exhaustive article on that subject, which contains about 14,000 words. It takes the subject up in minutest detail, and appeared in the issues of Nov. 5, 12, 19, 26, Dec. 3, 10 and 17, 1898.

Can water under extreme pressure be forced through rocks, such as granite, quartz and ordinary ore or vein matter? If so, what pressure per square inch does it require to accomplish this purpose?

Burlington, Wash., April 15.

Water has been forced through cast iron cylinders, appearing in minute globules on the surface, but we have no record of similar forcing of water through granite, quartz or ores, and while not deemed wholly impossible such action is not considered feasible.

I would be pleased to learn through your columns of the experience of others in sinking for water through quicksand and boulders. We have tried drilling with machine through a 7-inch casing, but are unable to get through hard boulders loosely bedded in sand. Box cribbing with a good pump that will handle sand seems to promise best. The experience of others in this line would be of great interest.

Ensenada, Lower California, April 10.

Any one able to contribute some practical experience in such case is respectfully proffered space therefor. There are doubtless some readers of the MINING AND SCIENTIFIC PRESS who can supply the desired information.

Tell me in "Concentrates" how a tunnel is ventilated with water. I have understood that water is run into a barrel and an air pipe connected with the barrel.

How can air be compressed by water in a shaft?

Redding, Cal., April 11.

There are several ways. A cheap fashion, effective in a small way, is suggested by our correspondent himself as regards the tunnel, viz., the automatic barrel system of ventilation, which consists of a barrel set in the stream, outside the tunnel, the bottom a few inches below water level and open; a funnel emptying through a 2-inch center into the top of the barrel, and beside the funnel, also inserted into the top of the barrel, the air pipe leading to the tunnel—say 4-inch. By a flume water conveyed to the mouth of the tunnel gathers air in its fall and drives a constant, even current to the breast of the tunnel.

As to the second question, may be instanced a mine at Magog, Quebec, Canada, where air is automatically compressed by a column of water flowing down a pipe in a shaft. The water is received in a tank, from which a vertical pipe descends in a shaft. The air is carried down in this vertical pipe with the water, being drawn through a series of small pipes at the head and carried down in the water in the form of small globules and delivered in the compression tank at the bottom, the compression being produced by the presence of the back column of water, each 27 feet of shaft depth producing one pound of air pressure in the cylinder. The water absorbs from the air the moisture contained in it and delivers the air dryer than the atmosphere, and at the same temperature as the water. A local paper says: "In the plant described 150 air H. P. is produced, and an efficiency of 62% is obtained, so that out of a given theoretic H. P. 62% was delivered at the engines."

Will you kindly inform me if there is a short volumetric test for gold? Prescott & Johnson gives one, but it is long and tedious.

Nederland, Colo., May 6.

We know of nothing reliable for a short volumetric test for gold.

I understand that in some of the California placers an auxiliary plant is installed for the saving of the black sand—magnetite, I presume—which is shipped to the smelters. I have had some very favorable assays returned from black sand samples, and would like to arrange to save mine, if possible. Nothing of the sort has been undertaken in any of the sections where I have worked, so I am at sea how to go ahead, barring some form of concentrator, such as vanner or shaking table, which I am in doubt as to its working on unsized material.

Can you give me a description in "Concentrates" of such a plant or device as is used for the purpose? I find nothing in the various hydraulic machinery catalogues nor in the MINING AND SCIENTIFIC PRESS.

Newsome, Idaho, April 15.

See answer to Lewiston, Idaho, inquirer above.

What is the law or requirement regarding private assays at U. S. Mints? Tell in "Concentrates" if I can I send ore for assay to the U. S. Mint at San Francisco, and, if so, what the charge is and how to go about it?

Bisbee, Ariz., April 28.

These questions from two other sources were briefly answered in the issue of the 21st ult. It may, however, be of general interest to append the following:

Section 20 of general instructions and regulations in relation to the transaction of business at the mints and assay offices of the United States is as follows: "Assaying and chemical analyses of ores and of furnace by-products shall not be performed at the mints and assay offices of the United States, except at the assay office at Charlotte, N. C. The mechanical preparation of pulverizing of ores and other minerals, mattes and slags shall be done upon the premises of the mints and assay offices only when a part of the technical processes of these institutions and in the course of their regular business. Assaying or chemical work in a private professional capacity at the hands of the officers of the U. S. mints and assay offices shall not be performed upon the premises of these institutions. Professional cards and certificates of assay or analysis should be without official captions or signatures. No professional signs shall be displayed upon the premises of mints or assay offices."

The Deadwood, S. D., office was established two years ago; the Director of the U. S. Mint then authorized assays of ores, etc., to be made there the same as at Charlotte, N. C.

If possible, give me through "Concentrates" information in regard to heating capacity of an ordinary Hoskins gasoline burner. I want to use as large a black lead crucible as possible for melting gold bullion—that is, say, size 16 (John Taylor's catalogue)—and would like to know if one burner, in an ordinary assay furnace, could supply heat enough to do the work. Will have to use gasoline; no coke.

Alameda, Cal., May 1.

It will require more heat than the ordinary gasoline assay furnace gives to melt gold in a No. 16 crucible. The No. 11 bullion furnace (gasoline), with Cary burner, will give satisfactory results.

This entire subject received detailed illustrated discussion and description in the issues of July 9 and 16, 1898.

Please state in "Concentrates:" 1. What effect has sulphate of iron on gold amalgam? 2. What would you recommend to procure the most gold amalgam in battery, by soft or hard amalgamating? 3. What would you recommend for one to become a competent assayer—by a correspondence school or by studying books?

Camp McKinney, B. C., May 4.

Sulphate of iron has no effect upon gold amalgam. In forming amalgam in the mortar of a battery, it is best to have it neither very hard nor very soft; if too hard, the gold can not catch; hence, will not save close, and when very soft it is liable to slide off the plates, and much of the amalgam passing out of the mortar to the plates outside, makes liability to loss great.

A correspondence school has its uses; studying books is essential; competent personal instruction and practical skill more so; so much depends upon the man himself; the general knowledge of the art can be learned from study; the "how to do it" best acquired by actual work with a good assayer. There are competent assayers who never read a great deal; but no one ever made a competent assayer of himself or of any one else by study alone.

What is comprised in the north half of the Colville reservation? When will it be thrown open? How can we get a chance?

Republic, Wash., May 5.

The north half Colville Indian reservation will be thrown open at 12 M., local standard time, Oct. 10, 1900. All of it which lies in Okanogan county, Wash., except range 31, will be entered at the land office at Waterville. Range 31 of Okanogan county will be entered at Spokane. In Ferry county make application to the county clerk at Republic or the U. S. commissioner, E. S. Topping. In Stevens county applications will be received by the county clerk and J. Stitzel, commissioner. In Okanogan county the county clerk is at Conconully; there is also a commissioner there and another at Ives Landing. Meanwhile prospectors can go on there now, so a man can go into any of the above offices one minute after 12 noon, Oct. 10th, and swear that he has been over each and every legal subdivision of a quarter section and make formal application.

Kindly state in the column of "Concentrates" the kinds of metals and the amounts of each that constitute the alloy called stereotype metal.

Silverton, B. C., May 9.

The following formula is furnished by our stereotyper: Lead, 78; antimony, 12; tin, 10. This is an average proportion. There should be one part bismuth, but its price is so high it is seldom used. For special work requiring extra wear 3% to 5% more of antimony is added in place of lead.

I have a General Electric dynamo of 10 volts and 150 amperes; it was made especially for precipitation of metals in solution. Please let me know in answers in "Concentrates" if this dynamo can be used for lighting purposes. If so, what number of lights it would give and what, if any changes, would have to be made?

Cherry Creek, Nev., May 12.

The machine which our Nevada correspondent has would not be satisfactory for incandescent lighting, and to make it satisfactory for this purpose it would have to be entirely rewound, which would probably cost as much as to get a new machine.

Kindly let me know the address of some one in California who has invented a foot power wood-sawing apparatus for sawing wood for domestic purposes. I have not been able to get a favorable reply from Eastern firms; they tell me they only carry foot power sawing machines for carpenters' use.

Stonewall, Colo., May 5.

What effect has sea water upon amalgamation of gold on silver-plated copper plates? Give precautions necessary to keep such plates in good condition. If verdigris appears on the plates while using sea water, what had best be done?

Is the U. S. Seattle Assay Office permitted to make assays and analyses of ores and other products?

Oakland, Cal., April 30.

Sea water has no apparent effect upon the amal-

gamation of gold upon silver-plated copper plates. If the plates tarnish much, use either potassium cyanide or sodium amalgam in the battery mortar or upon the plates; this, together with frequent rubbing of the plates with a small addition of quicksilver to the spotted portions, will soon overcome the difficulty.

The rules and regulations which govern the U. S. mints and assay offices clearly state that assaying and chemical analyses of ores and furnace products shall not be performed at the mints and assay offices of the United States except at the assay offices at Charlotte, N. C., and Deadwood, S. D. See answer to Bisbee, Ariz., inquirer above.

I wish a description of the process of manufacture of mineral wool from slag, or molten material by the use of the air blast.

Morenci, Ariz., May 2.

The Mineralized Wool Co., 18 Vesey St., New York City, can supply the desired information.

I would like to know where to find details of the latest method of producing caustic soda from brine and saving the chlorine.

Riverside, Cal., May 10.

Matheson & Co., Newark, N. J., or the Solway Process Co., Syracuse, N. Y., can furnish full details of the process.

Where tailings or debris have been deposited behind and are held back by a dam constructed in early days for reservoir purposes, can the debris so deposited behind the dam be elevated and flumed into the stream below the dam? Or can a tunnel be run around the edge of the dam, but still in channel of the river, debris to be taken through tunnel to stream below and there sluiced.

Auburn, Cal., May 10.

Not legally.

During the month of June, 1899, I located six mining claims in Shasta county, Cal. I had all the lines marked out and necessary monuments erected and recorded in the county recorder's office and went to considerable expense. About two days after the publication of an article by Mr. Ricketts, two of the best claims were jumped. To comply with the U. S. mining law, it would be necessary for me to spend $600 on these claims this year, which I do not care to do, taking chances on throwing it away through the mistakes of a miserable set of legislators, who do nothing but pass useless laws and then try to repeal them. Do you think my title will be good in U. S. Court if I comply with U. S. mining laws?

Rosemont, Ariz., April 7.

Yes. In such cases manifest intent and the good faith of the locator are largely taken into account, and courts have uniformly ruled that where it was manifestly the intent of the locator to comply with all legal requirements, no court would incline to the enforcement of forfeiture where the locator has shown such effort to faithfully observe the legal requirements, as our Arizona correspondent claims to have done in Shasta county, Cal.

Can you refer me through "Concentrates" to former issues of your paper, or elsewhere, that will give me details of converter treatment of copper matte as practiced at the Parrott Smelter, Butte, Mont.?

Leadville, Colo., April 23.

The latest direct reference to the Parrott Smelter in this paper was in the issue of September 4, 1897. An inquiry directed Chas. Bartine, care Standard, Anaconda, Mont., would doubtless elicit the desired information. The best and latest treatise thereon is the address or paper read before the Institution of Mining and Metallurgy last October by Prof. James Douglas. It has been issued in handsome form by Fraser & Chalmers, and a request for it addressed to them, Twelfth St. and Washtenaw Ave., Chicago, would doubtless procure it. It is entitled "Treatment of Copper Mattes in the Bessemer Converter," and is a valuable addition to metallurgical literature. The article, in condensed form, is now appearing in these columns. (See page 552.)

A has a tank 8 feet square, 11-inch pipe and 3-foot goer and 4-inch nozzle under 150-foot pressure, and water fills the tank under that pressure. B claims that a tank built 8 feet higher will derive more pressure with tank full of water. Which is right, A or B?

Sierra City, Cal., April 20.

If the nozzle is under 150-foot pressure the increase in height of tank would increase pressure in proportion to added height of tank, provided higher tank is full. The question is not entirely clear.

Kindly inform me whom I can correspond with regarding molybdenite, as I am the possessor of a claim of this mineral, but have been unable to find any one who is able to tell me anything about it.

Kennett, Cal., April 29.

Full information on this point was given on page 205 in the issue of Feb. 24, 1900.

Will "Concentrates" please give a method to determine if rock carries gold by the use of either nitric or muriatic acid, and is there any way to ascertain if rock carries silver by the use of the same acids. Sometimes a prospector finds himself 50 miles away from an assayer and it would be a great saving of time if he could have a method by which he could approximately judge value of rock in regard to gold and silver.

Kingman, Arizona, April 28.

To test quartz for the presence of both gold and silver by the use of nitric or muriatic acid, the ore should be reduced to a powder sufficiently fine to pass through a No. 60 sieve. Place this pulp, when screened, in some flat iron vessel over a fire, so as to burn out those elements which readily sublime or burn. The pulp, when cool, should be placed in a glass vessel and covered with nitric acid, pure or slightly diluted with water. To facilitate the action of the acid, the vessel containing the acid and pulp should be set in a pan partially filled with sand; then heat the pan. The sand will prevent the glass vessel from bursting by rapid expansion. As soon as the acid begins to boil set it off the fire and let remain standing for several hours. Add about as much again water as there is acid and pulp, then shake or stir thoroughly and filter off the liquid. The liquid thus obtained is a solution of the nitrates of all the metals that the rock contained and that are soluble in nitric acid. Add drop by drop a strong solution of common salt. If a white precipitate appears after adding the salt, it is either oxychloride of bismuth, mercurous chloride (calomel, a salt of quicksilver), or chloride of silver. To tell to which of these three classes the salt belongs, pour off the fluid above; if it dissolves it is bismuth, and neither silver nor quicksilver. If it does not dissolve pour off the acid and to the precipitate add strong ammonia. If the precipitate dissolves the salt, it is silver chloride. If it does not dissolve, it is quicksilver chloride or calomel. To the dried silver chloride add an equal amount of washing soda or borax, then it can be melted to a "button" of bullion.

As to the gold, take the pulp and filter saved from the first part of the experiment and put into a crucible and heat. The filter will completely burn. Next put the pulp through a very fine screen. Now soak for two days in an acid consisting of a mixture of four parts nitric and fifteen parts muriatic acid, which has been prepared at least two weeks before. This will convert any gold present into a perchloride of gold. Platinum will also be converted into a perchloride. Again filter; take the liquid that filters through and evaporate to dryness, either in a porcelain dish or glass flask in the sand, as before described. This is done to remove the acid. Dissolve the dry residue in water, simply by adding warm water to the flask as soon as it is sufficiently cool not to burst when adding the water. When the salt which remained in the flask after evaporating is thoroughly dissolved again, add a solution of ferrous sulphate (copperas) or of oxalic acid and set aside. Let stand for two or three days. A fine brown powder precipitated to the bottom of the flask is pure powdered gold. Pour off the liquid above the powder, wash thoroughly and dry. These precipitates may be melted into a gold button, but it requires great heat.

The following is a simple test for gold which may fill our correspondent's ordinary requirements so far as gold is concerned: For gold in oxidized ores, pulverize the sample and place in a porcelain lined vessel or tea cup, cover with iodine and allow it to stand for two or three hours. Then dip into it a piece of white filter paper, dry and burn it, and if it gives a purple color gold is present, and the deeper the purple the richer the ore. For other ores with this test, such as pyrites, the ore must be roasted. Where lime is present the ore must be roasted twice, the second time adding carbonate of ammonia. After roasting, test as with oxidized ores.

I wish you would have "Concentrates" answer the following questions: Can parties cut timber off from a mining claim, owned by other parties, for fire use, the claim being located according to the U. S. mining laws and recorded? Can one person locate more than one claim on the same lode adjoining one another?

Graniteville, Cal., April 30.

No one other than the locator can legally cut or remove timber from any unpatented mining claim even with the locator's consent; nor has the locator himself any right to the timber on his unpatented location, except for mining purposes on that claim.

Answering the second question, the only limit to the number of locations any one can make and hold is his ability to do the required annual assessment work thereon.

I wish you would favor me with some information of the "electro-peroxide" or "peroxygen" process. Am interested in experimental work relating to cyanide, but have seen no mention of any such process in your paper, though I understand it is in use.

Prescott, Ariz., April 28.

Any one having practical knowledge of the process would confer a favor by sending some brief data relating thereto.

How many simple elementary substances are there? What do you define an "elementary substance" to be? Name them, please.

Silverton, Colo., May 1.

An elementary substance is one from which nothing different from itself can be extracted. The chemical elements as at present known are seventy-four in number, as follows: Hydrogen, lithium, sodium, potassium, rubidium, cæsium, glucinum, magnesium, calcium, zinc, strontium, cadium, barium, mercury, boron, aluminum, scandium, gallium, yttrium, indium, lanthanum, neodymium, praseodymium, samarium, gadolinium, terbium, erbium, thulium, ytterbium, thallium, carbon, silicon, titanium, germanium, zirconium, tin, cerium, lead, thorium, nitrogen, phosphorus, vanadium, arsenic, columbium, antimony, tantalum, bismuth, oxygen, sulphur, chromium, selenium, molybdenum, tellurium, tungsten, uranium, fluorine, chlorine, manganese, bromine, ruthenium, iodine, osmium, iron, nickel, cobalt, copper, rhodium, palladium, silver, iridium, platinum, gold, argon, helium.

If eight persons locate a placer mining claim jointly, containing 160 acres, and seven of the joint locators subsequently deed all their interest to the one remaining joint owner, can he secure a U. S. patent to the whole 160-acre tract?

If all eight of the joint original locators deed all their interest to a stranger, can he secure a U. S. patent to the whole 160-acre tract?

Can any one person, at the same time, own, as above, several 160-acre tracts and secure U. S. patents for them?

Prescott, Ariz., May 3.

The Act of July 9, 1870, gave individuals or associations the right to take up 160 acres placer ground. This was superseded by the Act of May 10, 1872, which restricted individual placer locations to twenty acres. Where more than one person—not exceeding eight—join in locating placer ground, they locate the whole area jointly. Discovery need not be shown, Secretary Bliss having ruled that "when a placer location is made by an association, one discovery is sufficient."

On each twenty acres the equivalent of $500 in work or improvement for each twenty acres, or fraction of twenty acres, of the entire tract must be done before the locators are entitled to patent. "Lindley on Mines" says:

It is a matter of frequent occurrence that an individual locator, desiring to obtain more ground than he is permitted under the law to appropriate in his individual capacity by a single location, resorts to the use of "dummies," and perfects locations in their names, subsequently obtaining conveyances therefor. The courts have held that this is a fraud upon the Government. The same object can be accomplished without violating the law. There is nothing to prevent a miner from locating, by separate location, as many twenty-acre tracts as he pleases, either contiguous or non-contiguous. The right to locate and develop mining ground is not exhausted by a single location, as in the case of pre-emption and homestead entries. If he can discover mineral within the eight twenty-acre subdivisions of a quarter section of land, and is willing to develop them to the extent required by law as a condition precedent to the acquisition of title by patent, or to annually perform labor to the extent required by law upon, or for the benefit of, each, he is clearly entitled to do so. The statute simply inhibits the acquisition by an individual of more than twenty acres by a single location. During the period when rights were governed exclusively by local rules, in certain districts the number of claims which one might locate and hold at one time within that particular district were defined. But there is no trace of this found in the legislation of Congress.

This indirectly answers all three questions.

I want to know about Contreras Camp, seven miles from Jackson, Amador county, Cal. What is the formation? What is the character of the leads? What is their general width and value? Is there plenty of wood and water? What is being done in the camp?

Box 48, Altman, Colo., May 4.

Any one in the locality named able and willing to furnish the desired information can have sufficient space herein to make known the mineral resources of the vicinity.

I have a low-grade copper ore that I want to leach. It is too siliceous to admit of smelting. Give me some points as to what is best to do. Do you know of any concern successfully treating ore in that way? Please answer in "Concentrates," but don't publish my name, as I don't want to be swamped by a flood of pamphlets and proffers.

The above from a Nevada inquirer indicates a mistaken notion. Unless specially asked to be inserted, the name of an inquirer is not published, though the location is usually given. In this case it would serve our Nevada inquirer very well to have his name and address appear, for the "flood of pamphlets and proffers" that might follow the appearance of his address in these columns is evidently what he needs, though, as evidently, not what he wants. Men skilled in the commercial requirements of the situation could readily furnish him with "points," and it is the commercial side of the question that would probably be of most interest to him. However, his request for privacy will be respected. As to the first question, he might write to the Santa Rita Co., Santa Rita, N. M., who appear to have successful solution of the question. A letter addressed to the manager of the Black Warrior Copper Co., Globe, Arizona, might also bring some practical points. There are so many attendant circumstances that unless one knows all about the case it is difficult to give other than general outlines of possibilities.

A low-grade copper ore can be leached; the commercial results may not be wholly satisfactory. If there are large quantities of ore and one has money, he may make a commercial success. The process itself does not offer many great difficulties. The copper must be transformed into a sulphate, if water is to be had cheap enough. If sulphuric acid can be used, a simple oxidizing roasting will bring the cop-

per to a condition where it will dissolve in diluted sulphuric acid. If the copper in the ore is a carbonate, the roasting, of course, can be omitted in the acid leaching. It is a common practice in such case to pile the ore, allowing the rain and air to oxidize the copper sulphides, forming copper sulphate, which water will extract from the ores; but this is a very tedious process, involving a long wait for returns. There is an electrolytic treatment to leach copper ore carrying a little gold. The ore carrying a little gold and copper can be leached with a hot solution of cupric chloride in a rotating barrel, through which a slow alternating current of electricity is passed. This cupric chloride solution is prepared with a saturated solution of calcium or magnesium, chloride or salt, so that the combined chemical and electrical action extracts all the copper from the ore. The clear solution is run through a barrel containing copper oxides or hydrates, which will remove all the iron and similar impurities from the solution, leaving in it only pure copper. This solution is then passed into rectangular vats containing porous asbestos partitions with electrodes for conveying the current to the solution as it passes in the vats. As the copper is deposited the solution is pumped back to a reservoir for further use, this being made to last indefinitely, a little water being added to make up for evaporation and a little chemical to supply losses by leakage. The ore being freed from copper is then in condition for cyaniding. So far as known, however, the above described process has not been tried on a scale that would entitle it to endorsement from a commercial standpoint. Carbonate copper ore can be leached with sulphuric acid and deposition by electrolysis. A generator of 100 amperes, through a series of 320 vats or plates, will, theoretically, deposit 2000 pounds of copper per twenty-four hours from a sulphate solution and nearly 4000 pounds from chloride solution. The per cent of bluestone is proportionate to the increase or decrease of surface; with 8% it would be about 10 feet. Where sulphate is used and insoluble anodes, lead or carbon would do for the anodes. The vats in such case should be small, so that the slimes deposited from aeration of the solution could be easily cleaned out without disturbing too much of the series. A convenient size would be 4 feet square on each end and from 5 to 8 feet in length if a simple series is used, or 15 feet if tandem series; anodes 36x40, or with common series can be composed of smaller pieces. With such plate service the generator should have about 125 voltage.

The introduction of mining dredging has created new interest in the gravel deposits of the State and there are many men to whom it would be of interest to read in your pages how to go to work to amalgamate the gold in a sample of gravel so as to form a reasonably close estimate of its value. Of course, to assay an ore is a task for a scientific man, but to learn the value of the amalgamable gold in a gravel should not be a very complicated business.

San Francisco, May 8.

Can "Concentrates" inform me what wolframite looks like? What is the value of it per ton, and where is it used?

Gold Hill, El Dorado Co., Cal., May 5.

It is generally brownish or grayish black, with reddish brown streak; specific gravity, 7.3; occurs crystallized; is found in considerable quantities in many places. It is used to improve the quality of steel. Shipments are now made from Osceola, Nev., where wolframite ore is found carrying 66%. The consumption of wolframite in the United States in 1899 was 100 tons. See answer to Gladstone, Colo., inquirer at head of these "queries and answers."

State in "Concentrates" if a mining location can be made on a claim which has been previously located and staked, but has run out, using original boundary lines and monuments to define second location? Also, can a mining claim be located and held indefinitely without being recorded?

Junction City, Cal., May 6.

If a claim is actually abandoned, the ground is open to relocation in the same manner as though no location of the same had ever been made; but in such case as that cited it is extremely necessary for the intending relocator to be sure that he is right before going ahead. Answering the second question: in California, to be legal, a certificate of location must be filed with the county recorder.

Kindly advise through "Concentrates" which is the right way to proceed for a Cape Nome miner, since the Hansbrough amendment (Sec. 73) has been shelved in Washington, D. C. An alien located and held a claim through influences at Nome. The claim was relocated and recorded by an American citizen March 11, 1899. (1) This year the $100 yearly assessment work should be done. (2) How and the right way to proceed to stop the party from working and quit same if he is not entitled to the claim. This is a Federal question, as you state on page 370, April 7, 1900.

San Francisco, May 12.

The exact law in the case and answer to such inquiry was given in a column editorial on page 458, of the issue of April 28, 1900.

As a subscriber to your paper I shall be obliged if you will tell me the number of the canvas usually used in a canvas plant.

Bodie, Cal., May 9.

In the Gates, No. 8, 96 inches wide, is most generally used.

The Atlin Gold Fields of British Columbia.

Written for the MINING AND SCIENTIFIC PRESS by J. H. BROWNLEE, Provincial Land Surveyor.

The Atlin mining district is situated in the northwest corner, so to speak, of the Province of British Columbia, and is approached from Skaguay, Alaska, the latter being in touch with all the cities of the Pacific coast. From Skaguay to Atlin the journey is an easy one; first, for 50 miles over the narrow-gauge railway of the Yukon & White Pass Co. to Bennett, a small town at the southern extremity of Bennett lake; thence easterly another 70 or 80 miles by lake steamers to Atlin town, which nestles in a snug harbor on the east shore of Atlin lake. At present continuity of navigation to Atlin is broken for a distance of two miles. This is between Atlin lake and Taku Arm, and the portage is equipped with a tramway, having wharves at both ends. During the season of navigation, say, from May until November, the trip between Atlin and Skaguay is made in one day. In winter it takes at most two days over the ice from Log Cabin, a station on the Yukon & White Pass railway to Atlin.

The Atlin mining district extends from the Dalton trail, west of the Chilcat river, easterly through about four degrees of longitude, or a width of about 140 miles, to the watershed between Surprise and Gladys lakes. The northern boundary is the recently demarcated 60th parallel of north latitude. The southern limit is that much disputed irregular line between the United States and Canada. Within this extensive range of country there is in the aggregate a large area of lakes whose waters drain indirectly into the Yukon river, and which afford an easy means of getting about the country. The principal lakes of the district are Atlin, Bennett and Taku Arm. These are long, narrow stretches of water, lying over 2000 feet above sea level, and in a direction north and south, being parallel to each other.

It may be said that the Atlin placer diggings were discovered in the summer of 1898, although it had been known for years to old Cassiar miners that a few big lakes, of which the largest was called Atlin, lay in the northwestern part of the Cassiar district "amidst rugged hills and massive glaciers."

The first "claim" in the new El Dorado was staked by Fritz Miller and Kenneth MacLaren, hailing from Juneau, Alaska. Miller is a German and MacLaren a Canadian. These hardy and intelligent prospectors were guided by the crude sketch and description of a third partner at Juneau.

Branching off the main trail somewhere near Bennett, these two men traveled on the ice and across country to Atlin lake, and, after much wandering and some hardships, found satisfactory diggings on Pine creek and staked Discovery, where Pine City now stands, about 6 miles from the mouth of the creek. The news of the Miller–MacLaren strike soon got out, and a few good, more bad, and many indifferent placer miners followed last year, with varying fortune, as is usual in all new mining camps.

Pine Creek, Atlin, B. C.

The discoverers of Pine creek have been rewarded by taking out upwards of $40,000 from the creek bed alone in a length of about 800 feet. The benches are still unworked.

The winter climate of this country is not more severe than Dakota or Manitoba, if it is as cold. I can not better describe the scenic attractions of this region than by quoting from the report of the district, written for the Department of Mines at Victoria by R. C. Lowry, C. E., who, like the writer, has wintered in these parts, and is therefore not carried away by any "picnic" notions:

Pine Creek, Above Discovery, Atlin, B. C.

"To the natural beauties of this Atlin country it would be impossible for even the most apt pen to do justice. A combination of every feature that renders the most lovely landscape attractive, with a variety and scope of coloring unique in itself, is seen on every side in the ever-changing light of our glorious summer days. And from September, when the first tints of autumn gild the poplars and the birches, until

'The shadow of the winter's on the year,'

the rapid transformations, the kaleidoscopic changes,

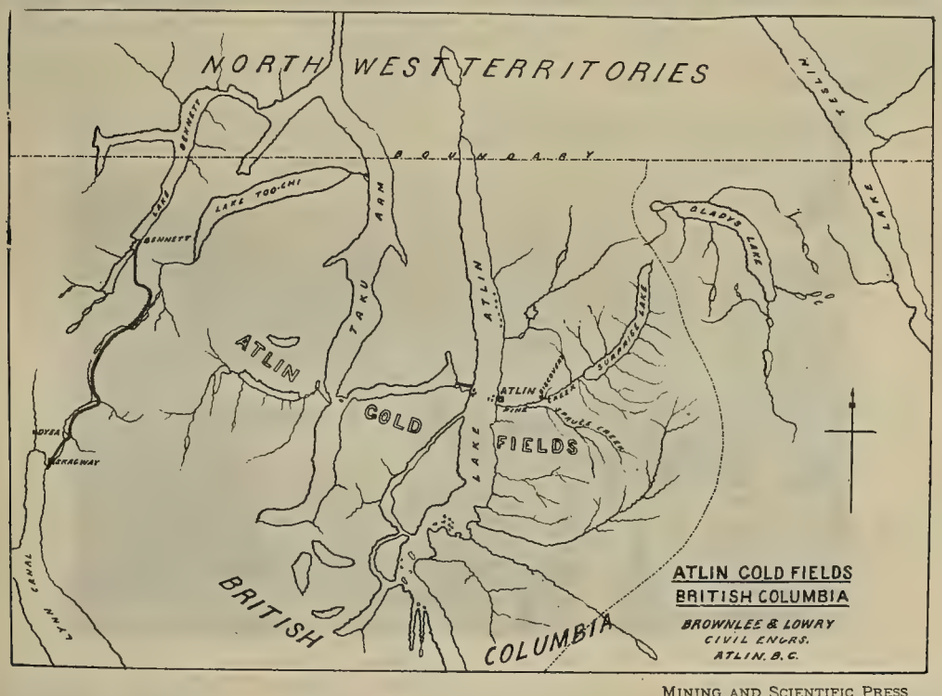
* See illustrations on front page.

make us marvel while we revel in the glories of fair Atlin."

A profusion of wild flowers abound, and small fruits, such as strawberries and red currants, grow wild in some parts.

It must be admitted that this country is not a sportsman's paradise. There are moose, cariboo, big horn goats and even bear, but for the most part the few Indians in the neighborhood get the big game. As a rule, good miners and prospectors are not looking for that particular kind of game. There is plenty of white fish and trout to be had with less trouble

Willow Creek, Atlin, B. C.



all the year round; ducks are plentiful in season, and ptarmigan and grouse make good winter sport. A satisfactory feature of this country, interesting to prospectors, is the comparative freedom from mosquitoes and insect pests.

Of paramount importance is the timber supply; this consists mostly of jack pine and spruce, averaging about 1½ feet in diameter. Considerable inroads have been made on forests near Atlin and along the creeks that were worked last year. It is fortunate that the country has not suffered of late years from forest fires. There appears to be a sufficient supply of timber in close proximity for hydraulic operations and mining purposes for some years at least. The price of sawed lumber ranges from $50 to $80 per M feet, depending upon the locality. There are three sawmills at Atlin and also, it may be mentioned incidentally, three chartered banks, all having business premises of their own.

Again quoting from Mr. Lowry's report, or what he is pleased to term "a mere sketch of prevailing conditions:"

"The geological formation of the district is already under examination by the distinguished department of the Dominion Government in charge of such scientific work. The formation is very interesting, there being many well marked contacts. East of Atlin lake as far as Surprise lake the formation appears to be diorite; beyond this gneiss predominates. At the south end of the lake sandstone of uncertain age prevails, and basalt is to be seen here as well as in other parts of the district. Southwest of Atlin City, on Goat island, there is a large mountain of syenite. Outcrops of limestone have been found.

"Cutting through the diorite in the bed of Pine creek, for instance, veins of quartzite as much as 6 feet wide, showing free gold, have been uncovered; and there are, e. g., in the vicinity of Atlin city extensive "blowouts" of the same class of rock which assay well. The thorough examination which the last-mentioned ore bodies are now undergoing at the hands of Lord Ernest Hamilton's company will demonstrate their worth; and if the apparently well-justified expectations of this company are realized the future of the Atlin camp is assured. Put briefly, the indications are that there are large bodies of low-grade ore susceptible of easy manipulation and which are largely free milling or amenable to a cheap process for the extraction of gold. The whole country has been under glacial action in relatively recent times. Indeed, a considerable portion of it is even now covered by glaciers, of which the principal one is known as 'Norna' or 'Llewellyn,' and lies in a line approximately northwest and southeast to the south of Atlin lake and Taku Arm, extending over a length of some 40 miles."

MINING AND SCIENTIFIC PRESS

The principal quartz locations were made last summer, consequently only a limited amount of prospecting has been done. Many specimens of free milling ore run high in gold, and this summer will see active prospecting and a more rapid development of the young camp than the alluvial diggings alone would warrant.

With reference to the inducements which this district holds out for hydraulic mining on a large scale, it may be truly said that they are well worthy of the attention of practical miners and engineers who are in touch with capitalists willing to investigate the opportunities at hand. All the physical conditions appear to be very favorable. The larger and lower-lying lakes afford a practically unlimited dumping ground. There are no hampering influences about debris, or agricultural interests to interfere with the proper working of the mines. Sufficient water is to be had on most of the creeks during the working season, which lasts for four months. There are, in many places, smaller lakes, at a high level, suitable for reservoirs, and in some cases economical conserving dams may be constructed on the smaller creeks or smaller feeders. The topography and hydrographic features of the country at once mark the district as being one eminently suited for hydraulic mining on a large scale.

The origin of the extensive gravel benches, sometimes on one side and more often on both sides of the principal creeks of the district, does not appear to be settled. The deposits are probably due to combined glacial and fluvial action.

The point of material interest, however, is the fact that these immense benches of gravel are auriferous and in some places are very rich. More or less gold has been found on every creek that has been prospected.

Most of the valleys are narrow and deep, with tiers of gravel benches or terraces. Occasionally there are cut banks 100 to 200 feet high. There is hardly a creek in the district that has not one or more canyons that may be utilized for controlling the water supply and for power purposes.

The fall of the creeks varies from 40 to 400 feet to the mile. Reverting to the all-important matter of gold production (for all the above noted advantages and attractions are as naught if the yellow metal is not here in paying quantities), it may be stated that there was from $1,200,000 to $1,500,000 taken out of the creeks and first benches last year by the most primitive methods of working, there not being a hydraulic plant worthy of the name in the camp last season.

Royalty was paid to the Provincial Government on $404,387. The banks at Atlin alone purchased more than this amount of gold, to say nothing of the many sacks that were taken out on which no royalty was paid. It is estimated by the merchants of Atlin that royalty was not paid on more than one-third of the output, which accounts for the difference between the official figures and the above estimate.

If any flour gold came out of the ground last year it is still in the dumps. Experienced placer miners have told the writer that there was a great loss caused by lack of practical mining knowledge.

Considerable work in drifting and sinking is being done on the first benches and on some old channels, giving results in many instances that will insure plants being installed this season. A few companies are preparing to hydraulic this year, and there are openings for more.

The benches are acquired by lease of eighty acres for twenty years from the Provincial Government at an annual rental of $50. A reasonable expendure annually developing the property is a condition of the lease.

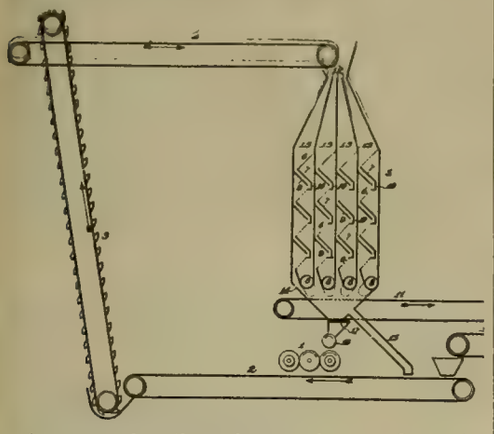
Abandoned creek diggings are also leased in the same way at an annual rental of $75. Creek bed leases are half a mile in length. That the acquirement of "abandoned creek diggings" would prove a paying proposition may be readily understood by referring to the following extract from Mr. Lowry's report:

"The past summer a great deal of work, much of it unintelligently approached, has been done by individual miners on 100-foot claims, working the creek beds. Some of these men have made money at the work, but it is doubtful if the larger portion of them made wages. In this Atlin country, at least, it is a fact that these 100-foot placer claims have proved to be a delusion and a snare. Argument in support of the above statement would be too lengthy to embody in what purports to be a mere sketch of prevailing conditions, but corroboration of the fact will be forthcoming on all sides.

"These same creek beds cannot, for the most part, be worked by the 100-foot claim holder owing to the great depth of gravel on the bedrock. To deal with the conditions economically hydraulic methods, including in places the use of elevators, will have to be resorted to. Intelligent mining in this way will be richly rewarded."

It is the writer's opinion that for six months of the year prospecting may be carried on in this Atlin region with fairer prospects of success, and with less physical hardships, than in any new mining camp in America.

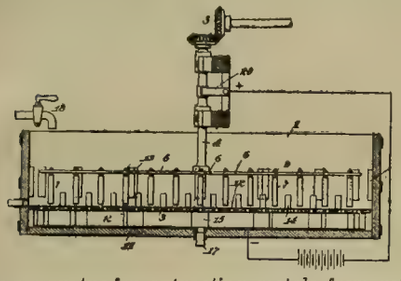
The dry, temperate summer climate is unsurpassed for enjoying out-of-door life. Pack animals thrive on the luxuriant bunch grass. Ponies and burros are cheap and may be utilized everywhere in the interior. Again, kind nature could not have better planned the waterways to help out the plucky searcher for gold-bearing rock or for rich alluvials.



[The engravings on this and preceding pages of scenes in the Atlin district are from photos furnished by Mr. A. C. Hirschfeld. Since Mr. Brownlee wrote the above article the Provincial Legislature has repealed the law excluding aliens from the placer fields of Atlin district.]

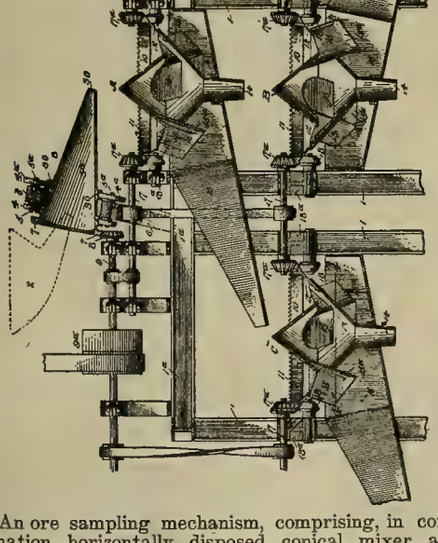
Mining and Metallurgical Patents.

Patents Issued May 8, 1900.



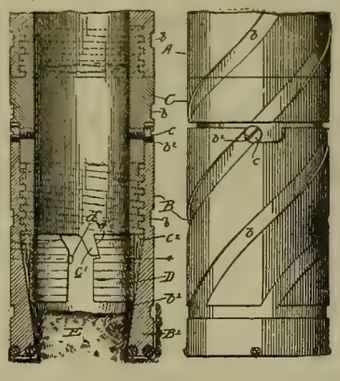
Specially Reported for the MINING AND SCIENTIFIC PRESS.

PROCESS OF SCREENING OR SIZING VERY FINE MATERIALS.—No. 648,934; T. A. Edison, Llewellyn Park, N. J.



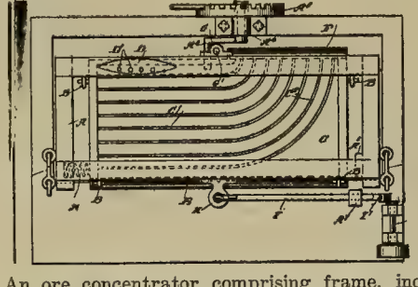
A process of continuously screening very fine material, which consists in maintaining in movement a practically constant load of a very much larger material than the material to be screened out, in deflecting and grinding portion of such coarse material, in adding ground portion to moving stream of coarse material, in subjecting mixed coarse and ground material to screening operation, in removing fine screenings, and in supplying to stream of coarse material an additional amount of coarse material to compensate for removed screenings.

APPARATUS FOR EXTRACTING METALS FROM REFRACTORY ORES.—No. 649,151; W. Wright, New York, N. Y.



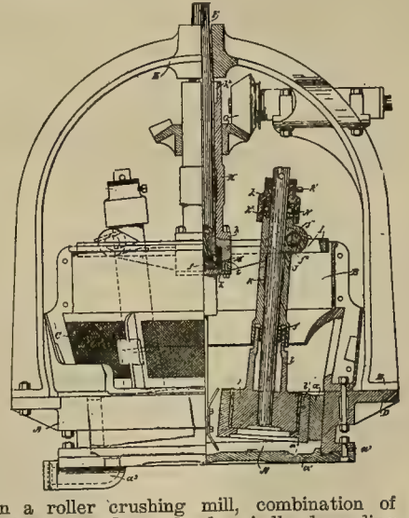
An apparatus for extracting metals from refractory ores comprising tank for receiving a sludge of such ores, stationary, horizontal, perforated partition in tank, forming beneath it a chamber, cathode on bottom of tank within chamber, filtering medium carried on partition, a number of pins arranged in series of concentric circles projecting upward from partition, main driving shaft, plurality of anodes carried by shaft and working between series of concentric pins, and plurality of dash plates carried by side of tank above partition.

ORE SAMPLING MACHINE.—No. 649,288; H. D. Fanders, Leadville, Colo.



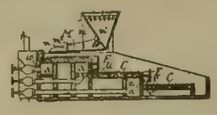
An ore sampling mechanism, comprising, in combination, horizontally disposed conical mixer and feeder having discharge opening in its apex end; suitable supporting rim; receiving hopper comprising an inverted conical body, having a central pendent discharge 14; an annular gear rim 11, fixedly connected to upper end of hopper; guide rolls 18, for rim; means for rotating hopper and receiver; collecting trough 16, disposed under receiver, receiver having its discharge 14, projected down through bottom of trough, conical bottom member 10, having its apex disposed directly under discharge end of hopper, bottom of member 10, being of less diameter than adjacent walls of receiving hopper; a series of equispaced division plates 15, fixedly connecting bottom 10, to receiving hopper, pockets 15, projecting through side walls of receiver hopper and discharging in collecting trough 16.

CORE BREAKER AND LIFTER FOR ROCK DRILLS.—No. 648,920; M. C. Bullock, Chicago, Ill.; M. A. Bullock, executrix of said M. C. Bullock, deceased, assignor to M. A. Bullock.



Combination with tubular drill rod, cutting head moveable with respect to drill rod and provided with an inclined interior surface, a split or open core gripping ring engaging inclined surface, a stop on cutting head engaging end of split ring, and interlocking means on drill rod and other end of ring whereby ring is held expanded and out of contact with core during normal operation of cutting head and is allowed to contract upon core when cutting head is not in action.

CONCENTRATOR.—No. 649,275; E. F. Davis, Wetmore, Colo.



An ore concentrator comprising frame, inclined table hung in frame and pivoted thereon, means for imparting bumping reciprocating motion to table, feed hopper for discharging material upon table at upper end thereof and at one side, riffles on table extending partly straight in longitudinal direction below feed hopper and partly curved in an upward and transverse direction, trough on lower front end of table for receiving tailings, and trough on upper rear end of table at discharge end of curved parts of riffles for receiving gold.

ROLLER CRUSHING MILL.—No. 648,960; F. A. Huntington, Oakland, Cal.

In a roller crushing mill, combination of pan, bracket above pan, fixed spindle depending from bracket over pan having on its lower end a fixed collar, sleeve having an extended bearing on and mounted rotatably upon spindle, extending below end of spindle and bottom plate on lower end of sleeve, driver carried by sleeve, ball bearing through which sleeve and driver are supported by fixed collar of spindle, bottom plate under hub and collar and secured to sleeve whereby confined chamber for oil is provided, and roller carried by driver and operating within pan.

ORE CONCENTRATOR.—No. 648,908; F. L. Bartlett, Canyon, Colo.

Combination in an ore concentrator of a laterally inclined and longitudinally reciprocating shaking table having longitudinal riffles, a grading or separating feed box, ducts or spouts leading from feed box for delivering several grades of ore along upper edge of table and water supply means extending along upper edge of table outside of line of delivery of ore.

Quartz Thermometers.

It is well known that quartz becomes pasty before it melts, and M. A. Dufour has therefore tried to work it like ordinary glass. The point at which it begins to soften is between 1000° and 1200°—the temperature of the interior of the oxy-hydrogen blowpipe flame. The working of quartz has shown itself to be perfectly feasible, says the Electrician, and it may become an important substance where a highly refractory body is required which has a definite chemical constitution, is not hygrometric, can not be oxidized and can not easily be reduced. Besides, it always remains transparent, and does not, like glass, evolve gases on melting. The author's first application was to thermometry. He constructed a thermometer tube of quartz and filled it with tin. It worked very well between 240° and 580°. The walls of the bulb had to be thick, as the solidifying tin otherwise pulled them together. The author is now making quartz vacuum tubes, which may possibly not occlude gases in their walls. It would then be possible to test the question as to what is the actual vehicle of vacuum discharges. The Electrical Review thinks that perhaps there is also an opening for incandescent lamps made of quartz.

Petroleum Product in California for 1899.

Mr. Chas. G. Yale, Statistician State Mining Bureau, furnishes the following data of the petroleum production of certain California counties for the year 1899:

	Barrels.	Value.
Fresno	439,372	$439,372
Kern	15,000	13,500
Los Angeles	1,409,356	1,409,356
Orange	108,077	108,077
Santa Barbara	208,370	191,288
Santa Clara	1,500	3,000
Ventura	496,200	496,200
Totals	2,677,875	$2,660,793

THE gun that will shoot 20.76 miles has been successfully jacketed at the U. S. Arsenal, Watervliet, N. Y., and will now progress to completion. It will be the most powerful piece of ordnance in the world, and will weigh, without the carriage, 126 tons. Its length will be 49 feet 6 inches; the diameter of the breech, 6 feet 2 inches; the size of the bore, 16 inches. Theoretical range of the piece will be 20.76 miles; weight of projectile, 2370 pounds. The projectile intended for the big gun is 64 inches long, and the powder charge consists of 1060 pounds. The powder will cost $265 and the projectile $600, so that the cost of every discharge, exclusive of wear and tear on the gun and the pay of people employed in its manipulations, will be $865. The projectile, with its initial velocity of 2600 feet a second, will penetrate wrought iron to the depth of 41.6 inches. To attain its maximum range the projectile will reach an elevation of five miles, and the pressure on the gun at the time of its discharge will be 36,000 pounds to the square inch.

CONSERVATIVE OIL MEN say that the value of an oil well is about three times its net earning power in one year. The earning power of a well is about two barrels per day less than the gross output, the value of a well to be measured on the ground. Thus the earning power of a 5-barrel well would be about 1080 barrels per year, valued at the present time at about $972, making the well worth $2915. A 10-barrel well would produce, net, in a year 2880 barrels, worth $2592, making the well worth $7776. A 20-barrel well would produce, net, about 6480 barrels in a year, valued at $5832, making the well worth $17,496. A 50-barrel well would produce, net, in a year 17,280 barrels, worth $15,552, making the well worth $46,656. A 100-barrel well would produce, net, in a year 35,280 barrels, worth $31,752, making the well worth $95,256.—Los Angeles, Cal., Herald.

Treatment of Copper Mattes in the Bessemer Converter.*

NUMBER II.

To hasten removal between the converter stands and relining platform, cars propelled by an electric motor are being introduced. Not less than three shells to each stand should be provided if the objectionable practice of cooling the exhausted lining by a stream of water is to be avoided. Four shells per stand should be provided if the matte treated is low and relining has to be very frequently resorted to.

The finished copper is generally poured from the converter into steel moulds ranged side by side on a long car, but moulds of crude copper cast from the converter are sometimes used. The moulds held from 250 to 300 pounds. The car is pushed by hand under the converter, though in some works a hydraulic piston is used to handle it. In the Heinze works in Butte, where the copper carries a large percentage of gold and silver, it is cast into thin plates so as to insure greater facility and accuracy in sampling.

At all the Arizona works remelting furnaces have been dispensed with. At the Copper Queen the matte, made from a mixture of oxidized and sulphuretted ores in cupolas of 120 inches by 42 inches at the tuyeres, is discharged into large wells which are mounted on rollers, and rotated like the converters by hydraulic machinery, one well standing in front of each furnace. From the wells the slag flows continuously, and the matte is poured directly into the converter, which is placed on a lower level. There is thus secured the minimum of handling. But though the capacity of each furnace is adjusted as accurately as possible to the capacity of its own converter, the furnace has occasionally to wait for a converter and the converter for the furnace, more especially as the matte should not be poured until the well is nearly full, lest the slag in any quantity accompany it into the converter. The tilting well was adopted after experiencing the difficulty of controlling the flow through a tap-hole directly into the converter from a deep receptacle holding so many tons of matte. In order to remedy the defects of the plan each furnace is being provided with two wells in tandem. An electric crane is being erected to move the matte from any furnace well to any converter, and to lift the converter slags and pour them into one of the wells nearest a furnace stack. In works now being erected at Nacosari (see article on copper mining at Nacosari in MINING AND SCIENTIFIC PRESS, March 31, 1900), in Sonora, the well is placed to the side of the furnace instead of in front and can be tilted to the the rear as well as to the front, and therefore when it has to be emptied of matte the supernatant slag can be poured off to the rear.

At the large works of the United Verde Company, in Yavapai county, Arizona, where large trough converters of nominally ten tons capacity are used, the cupola furnaces are discharged into large stationary wells lined with magnesia brick. The slag which flows from the wells is removed by four-ton pots propelled by electric motors, and the matte carried to the converter by an electric crane in ten-ton unlined steel ladles. Wells are also coupled to the furnaces in the Detroit Copper Company's works, but there the matte is conveyed to the converter in ladles on an electric car. At the Arizona Copper Company's works in Clifton, the matte tapped directly from the cupola is stored in a reverberatory furnace, from which it is transferred, as required, to the converter by a ladle moved by an electric crane. The fuel consumption in keeping the heat in the reverberatory is very light.

The largest converters on this side of the water, those at Aguas Calientes, Mexico, which are 96 inches in diameter, by 16 feet high, are cylindrical. Only one of the sections, namely the bottom, can be removed for lining; the middle and top sections are relined in place after the fresh bottom section has been returned. The plan of relining in place is, as pointed out, open to the objection of throwing a whole section out of work for a long period. The use of very large converters has not, heretofore, found general favor, though most of the arguments which can be adduced in their support for the treatment of steel would likewise apply in the treatment of copper. The size of converters at the principal works to-day are as follows:

Aguas Calientes, 96 inches by 16 feet.

Boston and Montana, round converters, 7 feet 1½ inches maximum diameter, height over all 11 feet 9 inches.

Anaconda converters, maximum diameter 6 feet 1 inch, height over all 9 feet 10 inches.

Stalmann square converter, 5 feet by 5 feet; height over all 7 feet 10 inches.

Trough converters used at the United Verde.

Trough converters used at the Copper Queen, Arizona Copper Company, and Detroit Copper Company, 8 feet in length and 5 feet 8 inches in diameter. Trough converters at Nacozain, Sonora, 9 feet in length and 6 feet 8 inches in diameter.

Four types of converters are in use:

1st. The circular upright converter with elevated tuyeres.

2d. The upright converter with square body and trough-shaped bottom, designed by Mr. Stalmann. Both these revolve on trunnions.

3d. The trough or barrel converter, resting and revolving on rollers.

4th. The David selecteur, or oval upright converter, with bottom tuyeres and protruding pocket in which to collect the first copper formed.

The forms of converter above enumerated will undergo still further modification. The direction of change will probably tend towards effecting the smelting and the converting in the same furnace. We have seen that the difficulty Holloway met with in trying to smelt in the stack of a cupola, using the heat from the escaping gases generated by blowing through the matte in the hearth, wrecked his enterprise. The project is so attractive and seems so simple that it has possessed a fascination for the metallurgist, and been proposed again and again with manifold variations. But in fact it is surrounded with almost insuperable difficulties, and offers but few advantages. Such complicated metallurgical operations, when they are violently corrosive, and therefore destructive of the structural material of the furnace, can rarely be effectively conducted in close furnaces. The obstacles which beset pyritic smelting when performed alone in a seperate furnace have proved to be many and serious. Add to these obstacles those which must attend the concentration of the matte in the crucible of the same furnace, though neither the furnace nor the crucible can be reached for relining, and the difficulty of disposing of the gases, which, containing a notable quantity of condensable vapor, are sure to clog up the flues, and we have to meet and overcome such a combination of unfavorable conditions that the task would almost seem to be hopeless.

But the smelting of ore into matte and the subsequent conversion of matte into copper by the injection of air into a reverberatory furnace is not open to the same objections, and may prove to be not only practicable but economical. Large reverberatories are now being built capable of smelting more than 150 tons of ore a day, and therefore accumulating a very large body of matte. In bessemerizing in the same open furnace silica or siliceous ore could be more effectually added to the charge than in the converter, and the cost of lining correspondingly reduced.

Besides the converter, the only other essential element of the plant is the blowing engine. The only type of blower heretofore used has been one or other pattern of the direct connected blowing engine.

(TO BE CONTINUED.)

*Condensed from a paper read by JAMES DOUGLAS before the London Institution Mining and Metallurgy.

Shaft Sinking by Rounds.

TO THE EDITOR:—Herewith is furnished an extract from one of our shaft record books. We have found this method of following up our shaft work to be very satisfactory, inasmuch as it gives us the personal equation of every man employed on the work.

Auburn, Cal.

MINING SUMMARY.

ALASKA.

Reports come of a strike at the Sea Level mine, Thorne arm, southeastern Alaska, where sixteen men have been continuously employed during the winter. Since this mine was opened up there have been driven 800 feet shaft, tunnels and crosscuts. There are 3000 tons of milling ore on the dump. A stamp mill is projected.

The steamers Al-Ki and Seattle took north several miners for the Treadwell mines and construction lumber for the additional stamps. The new mill structure to be erected on the Treadwell property will consume 1,000,000 feet of lumber. It is expected that by October 1st over 1000 stamps will be dropping at Douglas island.

About 500 men left San Francisco for Cape Nome this week. As many more went from Northern ports.

ARIZONA.

COCHISE COUNTY.

The Commonwealth mine, at Pearce, is credited with having produced gold and silver bullion during April valued at $120,000.

GILA COUNTY.

Supt. Calder of the Pinto Creek M. & S. Co. has let a contract for a 300-foot tunnel on the Yo Tambien mine.

Mgr. Andrus of the Globe sampling works has shipped two carloads ore to El Paso.

At Globe, the Old Dominion, for the twenty days' run in April, produced 460,000 pounds of copper.

MOJAVE COUNTY.

E. Hilty is operating the Alata mine at Chloride.

Near Chloride the Diana M. Co. of Los Angeles, incorporated under the laws of Arizona and stocked at $600,000, H. B. Eakins secretary, will develop a group of claims west of Chloride, in the Sacramento valley.

YAVAPAI COUNTY.

At Cherry creek the Eclipse M. Co. has a 5-stamp mill at work. The G. G. M. M. Co. is sinking the Mammoth shaft to the 300-foot level. The O'Leary M. Co. has material on the ground to erect a 5-stamp mill.

At Jerome to the United Verde's smelting plant is being added a 20-foot extension and a new office building.

The 48-ton smelter of the Verde Queen M. Co. at Jerome is completed.

YUMA COUNTY.

El Rey is the town growing up around the King of Arizona mine, 50 miles north of Texas Hill, 45 miles on the Arizona side of the Colorado river and 30 miles from Castle Dome, connected with Texas Hill and Gila City by stage lines. Several men are employed at the mine and cyanide plant. Water is had from three wells, each over 1000 feet deep, 5 miles from the plant. Storage tanks have been constructed to hold 150,000 gallons.

CALIFORNIA.

ALAMEDA COUNTY.

J. C. Hays and J. W. Hampton have located a talc mine in the vicinity of Livermore.

AMADOR COUNTY.

Near Pine Grove work on the Dane and Mitchell mines has been resumed under the superintendency of L. Heiner.

The Belmont mine is being operated by J. McKelvey.

The Jackson Exploration Development Co., Ltd., is in receipt of a communication from its consulting engineer, John Ross Jr., in which he says: "I do not usually write to the companies unless a report is called for, but in this case I feel that I would not be doing my full duty to your company if I did not write and urge you to continue this work after so much money has been spent." A sub-committee of the shareholders had recommended the directors to cease further expenditure of an exploratory nature on the Amador Queen mine, with a view to husbanding the cash resources of the company. Upon the receipt of Mr. Ross' letter, however, the directors decided to issue the remaining shares, with a view to further development.

Sutter Creek Record: Supt. Tregloan at the South Spring Hill mine, Amador City, will put the mine in repair.——Near the El Dorado county line the old Richmond property is being opened up under the name of the Philadelphia mine by Supt. Haggerty.——At the Gover mine Supt. Purrington has thirty men at work preparing for a new hoist on the north shaft. ——At the Keystone Supt. Pritchard has upwards of 100 men. The compressor will soon be at work.——The new hoist for the Baliol mine will be finished by Knight & Co. next month.

Dispatch: The east shaft of the Kennedy mine is down 1240 feet and being put down 18 feet a week.——At the Spagnolia mine, Clinton, the lowest value so far is $3.30 a ton, and the rock goes from that to $30 a ton on drill borings.——At the South Eureka low-grade ore is being uncovered and Supt. Parks says the indications for a good, permanent mine are excellent.

BUTTE COUNTY.

T. W. Reece will this season operate the Amo mine, near Oroville. Twenty men are now cutting a bedrock tunnel.

The Spring Valley hydraulic gold mine at Cherokee will resume; work on the restraining dam has begun. Mgr. Holl and Supt. Hellman will direct operations.

CALAVERAS COUNTY.

G. Tellis of San Francisco has bonded the Josephine mine, near West Point. After the shaft is unwatered sinking will be resumed.

The mill test of 100 tons of ore from the Cape Horn mine, near West Point, was considered sufficiently satisfactory in result to justify the placing of a small stamp mill. The same action is reported from the Commodore mine.

Regarding the Sheep Ranch mine, the mill is running, the shaft has been cleaned and forty men are at work.

H. E. Pickett of Placerville has a three months' option on the Lamphear, near Mokelumne Hill.

EL DORADO COUNTY.

Georgetown Gazette: At a miners' meeting at Volcanoville, J. W. Edmondson was re-elected mining recorder of the district. ——Messrs. Jones & Roberts have bonded the Hart mine, two miles from Georgetown.——At the Garfield, owned by Senator Chapman, the tunnel is being pushed to tap the ledge.——Hinkley Brothers & Kenna have struck pay gravel. Their tunnel is in 760 feet, through solid bedrock. ——The crosscut is being extended in the tunnel of the Kentucky Flat mine.——Spencer & Morgan are taking out gravel from the Tiedeman mine tunnel.

HUMBOLDT COUNTY.

The main flume of the Orleans Bar G. M. Co. is completed. Some of the mines in that vicinity are closing down on account of lack of water. Little snow fell on the mountains—result, a short season.

The Pacific Beach M. Co., Little River, is sold to the Acheson M. & M. Co., of New York, who now take charge.

KERN COUNTY.

The Californian reports a find of gold 15 miles east of Randsburg, a dry placer proposition.

MARIPOSA COUNTY.

Near Coulterville, the Nameless Co., White's gulch, proposes building a dam on the Merced river and putting in a quartz mill to run by water power.

The Columbus Co. projects a new mill.

The Murphy mill is crushing pay ore.

L. E. Aubury has bonded the Romo and Sierra Rica mines, Colorado district.

NAPA COUNTY.

During April the following number of flasks of quicksilver were shipped from the mines near Napa: Napa 351, Ætna 300, Great Western 128, Vallejo 79, Sulphur Bank 24. Total 882 flasks—a decrease of 153 flasks from the March shipment. The product of three Napa county quicksilver mines for the past two calendar years compares as follows:

	1898, flasks.	1899, flasks.
New Idria	5,000	4,780
Ætna	3,450	3,450
Napa	7,850	5,850
Totals	16,300	14,080

The sales of quicksilver in 1899 and expenses are as follows:

	Sales.	Expenses.
Ætna	$156,454	$ 86,190
Napa	239,449	146,100
New Idria	195,298	97,256
Totals	$591,201	$329,546

The Ætna paid $45,000 in dividends, the other two mines each $90,000. The New Idria expended $13,760, the Ætna $2769 and the Napa $4387 for construction and repairs.

NEVADA COUNTY.

The poles from Floriston supporting the wires for transmission of electric power to the Comstock are Oregon yellow pine, soaked in oil, 1 foot in diameter at the base, set 130 feet apart. The pole line is equipped with six wires, each one ¼ inch in diameter and weighing about two ounces to the foot. The total length of the six wires, if stretched in a single line, would be 180 miles, weight 118,000 pounds, at 18 cents per pound the bare wire required for the pole line costing $21,384. The number of poles required for the line is about 1300.

A 16-inch pump has been installed at the Union Hill mine by W. C. D. Body.

Work on the new 20-stamp mill at the Plumbago mine begins this week in charge of C. C. Weisenburger.

Union: The U. S. Circuit Court of Appeals has sustained the opinion of Judge Morrow of the U. S. District Court in the case of Gaylord et al. vs. the Gold Hill M. Co. The property involved was the Nevada City mine, recently purchased by the Champion M. Co. It was a question of title between the lien holders and Eastern bond holders, who claimed the mine. After the opinion of Judge Morrow in favor of the miners, the Champion M. Co. purchased the property and took all the risk of further litigation and decisions. The price paid was $35,000, and the last payment was made a few weeks ago. The Champion Co. now wins the case.

PLACER COUNTY.

At Gold Run Supt. Moody of the Inskip M. Co. has successfully made connection, enabling him to go on with hydraulic work by means of completed tunnel and upraise.

The Sailor Con. M. Co. has levied an assessment of 1 cent per share, delinquent June 22.

RIVERSIDE COUNTY.

(Special Correspondence).—The Granite mine is owned by the Riverside M. & M. Co., 40 miles north of here, and has just put in a Mystic mill and a 20-ton cyanide plant.

Salton, May 13.

SAN DIEGO COUNTY.

Some stir is reported around Fallbrook, where several claims have been located and considerable development work begun by A. Campbell and F. W. Chapin.

SHASTA COUNTY.

The Fair View G. M. Co., T. J. Jordan, J. W. George, J. C., E. and M. A. Dyas, capital $100,000, all subscribed, has been organized to work the Rabbit gold mine.

SISKIYOU COUNTY.

(Special Correspondence).—W. Wike recently discovered a ledge near Salmon river 25 feet wide, and is arranging to take ore to the Jumbo mill, 8 miles. The mine is bonded to men in Grant's Pass, Or.

L. Errickson's strike on White's gulch continues to show good ore. H. Finley has bought an interest.

C. Clinton has opened a body of low-grade ore, 70 feet wide, on Salmon river.

Cleaver & Co., at the head of White's gulch, continue taking ore averaging $20 per ton.

Hickey Bros., who own five adjoining claims to Cleaver & Co., are beginning to work on the Jim Budd mine.

The recent break in the Salmon river ditch and flume has been repaired, and their hydraulic mine near Sawyer's Bar is being worked day and night with success.

Sawyer's Bar, May 15.

Jno. Daggett has twenty-five men at work at the Black Bear mine.

An expert visited Jackson creek at South Fork of Scott river lately, to purchase mining ground, and after discovering it was in the railroad grant, bought the land of the railroad company and paid for it. Upon making a survey, it was found the land bought was a long way off toward the summit of Scott mountain, and not worth anything.

Journal: The Baer Brothers, Maxwell, Dwinnell and Frye sold their Cherry Hill quartz mine and mill last week to C. F. Baker for $25,000.

TRINITY COUNTY.

The Last Chance M. Co. has let a contract for enlargement of ditch to carry water to their properties near Lowden ranch. The company will also improve the property this summer.

G. E. Bailey, Supt. Adele M. C., Lewiston, has a rotary mill to work the cement gravel, the first attempt of the kind in Trinity county.

TUOLUMNE COUNTY.

Mgr. J. E. Potter will put a 10-stamp mill on the Clio mine, Jacksonville, to be operated by steam power.

At the Tri-Color, at Tuttletown, the new hoisting gear and equipment is about ready for operation.

The Rising Sun mill has put through seventy tons from the Little Beauty mine, Arrastraville, that gave good returns.

The Wheal Perrin, at Soulsbyville, is being unwatered.

Supt. Moore, near Summersville, has unwatered the Green mine.

Supt. Graham is developing the Duleeke mine, near Groveland. Supt. J. P. James is sinking and drifting on the Climax mine.

Democrat: The shaft of the Mack Con. at Big Oak Flat is down 430 feet, with levels at 150 and 200. The vein is from 6 to 25 feet, and, independent of rich spots, the ore yields from $5 to $7 in free gold, and when the mine is in proper shape for rapid and economic stoping a 20-stamp mill will be erected.——At the Bawn the shaft is 640 feet deep and will be sunk to a depth of 1200 feet.——The Dreisam has hung up its stamps pending the sinking of the main shaft to the 400-foot mark. The present depth of the shaft is 200 feet. ——The Seminole group of mines, after lying idle for several years, is to be worked again, under the management of C. H. Thomas, formerly Supt. Dead Horse mine.

COLORADO.

BOULDER COUNTY.

Boulder hears that the Cold Spring M. & M. Co. has about decided to put up a 100-stamp mill on Left Hand creek near the mouth of their tunnel. A present visit of W. A. Jackson, a director, and J. M. Page, manager of the company, gives rise to the report.

Ward Miner: The Monongahela mine, at Sunshine, is sold to the Venango M. & R. Co. for $15,000.——At the B. & M. mine, Supt. R. J. Walter is succeeded by M. Bossen.——J. Rice has leased and bonded the Colorado mine and the U. P. group for $40,000.

CHAFFEE COUNTY.

At Granite the Hudson tunnel is in 410 feet. The 3-foot body of mill ore holds out.

CLEAR CREEK COUNTY.

Near Georgetown the Bismarck mine last week shipped five tons, which gave values of 909 ounces silver and 51% lead per ton.

The Courier claims that Georgetown produces the highest grade silver ore of any mining region in the world and gives a few recent mill runs: Seventy-seven sacks of ore from the Peterson lease on the Bismarck, sampled, brought $2505. The last run of Roberts & Co., from the same mine, returned 834 ounces. The Rubado lease on the Pelican is producing 400-ounce ore in five ton lots. The last run from the Aliunde carried 675 ounces silver and 34% lead, and brought over $7000. James Lyon & Co. shipped twenty tons of ore from the Smuggler last Saturday that milled about 200 ounces silver and 58% lead. At the Chamberlain & Co.'s sampling works the value of the ore crushed and sampled in the space of three hours exceeded $7400.

FREMONT COUNTY.

Manager Milliken of the Colorado Ore Reduction Co. will install a gas plant at Florence for roasting ores.

GILPIN COUNTY.

At the Growers mine Supt. Thos. Dunstone is advertising a contract to sink 600 feet in the Running lode shaft, near Black Hawk.

During April the shipments of crude ore and tailings from Black Hawk to outside points for treatment only reached a total of 186 tons, not more than half the regular shipments, showing how the storms hindered ore shipments.

GUNNISON COUNTY.

W. A. Welch, Supt. Ruby Chief mine, says that his company is prepared to thoroughly develop the Ruby Chief and will extensively operate it. J. G. Berryhill, Des Moines, Iowa, is president and general manager.

HUERFANO COUNTY.

Walsenburg reports that the Scantic, owned exclusively by Eastern men, has closed down indefinitely. The Scantic has a tunnel over 500 feet long. The owners had been working a large number of men all winter.

LAKE COUNTY.

Bismuth ore is being shipped from the Ballard, near Leadville. The first shipment of seventy-five tons went to London last week to a brokerage firm, thence to Freiburg, Saxony, for treatment.

The Valentine M. Co. at Leadville has acquired 105 acres from the Oro M.,D. & F. Co., and will develop this area by sinking two more deep shafts. Test of the ground by diamond drill showed 312 feet of wash, 93 feet of white and black porphyry, 45 feet of birdseye porphyry, 2 feet of mineralized contact, and 35 feet of lime from the contact to the point where boring stopped, a total depth of 487 feet.

At Leadville, the Home M. Co. is considering a plan to effect a consolidation between it and the New Leadville M. Co., which owns sixty-one acres on Rock hill, to dissolve both the Home and New Leadville Companies and form a new company to be known as the Leadville Home Consolidated Mining Co., capital 1,500,000 shares, each stockholder of the Home to receive twenty shares of the new capital stock, the stockholders of the New Leadville Co. to receive 225,000 shares, leaving 275 shares for treasury stock.

LINCOLN COUNTY.

J. J. Fay, of Los Angeles, has bought the Golden Treasure, Last Chance, Red Belt, Golden Star, Tip Top and Golden Queen claims, opposite Bull's Head canyon on the Nevada side of the Colorado river, for $20,000.

MINERAL COUNTY.

(Special Correspondence).—The Commodore is shipping 4500 tons per month of

crude ore. The mine is opened through five tunnels, the highest two not being used. The three others, about 400 feet apart vertically, extend in from 3000 to 4000 feet, all being connected by upraises. The ore is carried to the mouths of tunnels in cars, whence it is conveyed to ore bins at the railroad by bucket tramway. These ores are silver-lead, the lead being the most prominent factor. The Commodore power plant comprises a 5-foot water wheel, driven by water through a 26-inch pipe line, a five-drill air compressor and a 135 H. P. electric generator. It is intended later on to operate an electric hoist.

The Wooster tunnel, originally known as the Nelson, is now in about 7000 feet and drains the Amethyst, Chance and United mines. The tunnel has a fall of 6 inches to 100 feet. Ore from the Bachelor and Chance is transported through this tunnel. W. G. Boyle is manager of the Wooster and also works the Bachelor mine under lease.

The Amethyst is being worked by the owner company and is in charge of L. E. Campbell, managing director, and Cyrus Miller, Supt. This property ships the heaviest tonnage of any of the Creede mines.

The Happy Thought, in charge of F. E. Wheeler, is sinking a shaft to the level of the Wooster tunnel, having sunk about 1200 feet and having about 600 feet deeper to sink to strike tunnel level.

Up East Willow creek the Ridge and Solomon are working, each operating a concentrating mill. The Solomon mill is equipped with crushers, rolls, jigs and Wilfley tables, and is in charge of J. A. Smith. About forty tons per day are concentrated. Supt. Abbott states that the ores are somewhat siliceous and the sulphides considerably oxidized.

The Ridge, in charge of Supt. E. R. Mosher, is worked through a tunnel which penetrates to a horizontal depth of 1500 feet. At a point in the tunnel, 400 feet from the entrance, a shaft sinks 400 feet on the vein, a skip being operated by steam. The Ridge concentrator is operating, in charge of H. L. Decker, the product amounting to about 300 tons of concentrates per month. The power plant has two boilers of 180 H. P., a four-drill compressor and two pumps of 1000 gallons of water per minute capacity.

The United mines, next to the Amethyst, are operating under lease to the Big Kanawa Leasing Co., of which H. C. Rowley is Supt. A connection will soon be made with the Wooster tunnel. The property is shipping. WASCOTT.

Creede, May 7.

PARK COUNTY.

The Peerless Maud mine has resumed under the management of Hugh Dyatt of Leadville.

PITKIN COUNTY.

At Aspen, the Times says that a strike has been made in the Mary B. — five ounces silver and 50% lead.

SAN JUAN COUNTY.

Near Gladstone the Henrietta and Mineral King are dumping lead and copper ores, to be treated by water and heat concentration through the company's proposed matte smelter and concentrating mill to be built on Cement creek, two miles below Gladstone.

A. Lamson has tungsten claims on Dry gulch, carrying tungstate of manganese. The Fisher mill will soon start up on these ores.

A strike is reported near Silverton in the Copper Belle mine, at a depth of 250 feet, of an 8-inch streak of a gold bearing telluride, which causes the Chronicle to suggest that the Silvery San Juan is a misnomer, and that the real name should be the Golden San Juan. The region comprises San Miguel, San Juan and Hinsdale. It is a country of long, deep fissures cutting and penetrating all formations, including the eruptive, sedimentary and fundamental rocks. In the larger mines the character of the ores frequently changes with depth. On the surface the Tom Boy mine, near Telluride, had its values mostly in silver. It has now become an almost exclusive gold mine. The Silver Lake mine, near Silverton, has with depth increased its values by 300%.

SUMMIT COUNTY.

Breckenridge reports that satisfactory financial arrangements have been concluded by the North American Gold Dredging Co., so far as financing the company for the present season is concerned, whereby it will resume mining operations June 1.

TELLER COUNTY.

The Detroit Reduction Works, Independence, still await machinery shipped April 26. When it reaches Independence and is in position the mill will handle 100 tons daily.

The G. B. M. Co. has sold its Badger claim to C. W. Kurie for $10,000.

The Amazon G. M. Co. has sold its Modoc claim to the Portland G. M. Co. for $50,000, and the proceeds of the sale were divided in the form of a 10-cent per share dividend.

The Venture corporation, which has acquired the Independence mine, has decided to build a $300,000 reduction plant either at Colorado City or Florence.

In the Portland mine at Cripple Creek the ore body has opened up into 57 feet.

The El Paso has shipped 250 tons. Returns from fifty tons went $162.50 per ton. It is expected that the remainder will run as high.

Post: At the Independence mine all the miners employed are members of the miners' union, but many of them have fallen behind with their dues. The secretary of the local union has been allowed to post notices requesting the delinquents to settle up and show clear cards to the union by May 15. This request has been indorsed privately by the superintendent of the mine, and the miners feel that a failure to comply will be followed shortly by a discharge.

IDAHO.

CASSIA COUNTY.

F. Alder, San Pete county, Utah, has secured control of the Black Prince group, paying E. Romney $12,500 for 25,000 shares.

NEZ PERCE COUNTY.

The Wild Goose Rapids M. & M. Co., capital $100,000, has incorporated.

SHOSHONE COUNTY.

At Murray it is reported that the Stonewall has been bonded to Butte men for $20,000.

At Wallace the Headlight M. Co. owns four claims adjoining the Mammoth on the west, covering the same vein for 3000 feet, and proposes to open up the ground by two tunnels.

A Spokane correspondent says the Cœur d'Alene country is in a prosperous condition, and the production will far exceed anything ever produced. The output for the month of April was 14,000 tons of concentrates. All labor troubles are settled; there is abundance of good labor to supply all demands, and things have settled down to a solid basis. The hotels are filled with strangers, looking over the country with a possible view of investment, which is a condition of affairs that has not existed in that country since 1892. Each and every mine in the Cœur d'Alene country is working to full capacity and promising prospects are sought.

At Burke the Tiger–Poorman is temporarily closed down while retimbering is being done on the shaft.

WASHINGTON COUNTY.

S. F. Pair is going to put in a small test plant at Cuprum, to extract the copper from the ore of the Seven Devils. He thinks he has a process whereby he can extract copper at a cost of 3 cents a pound for the copper and save 95% gold and silver.

MICHIGAN.

In April 5767 tons of Baltic rock were stamped at the Atlantic mill, from which sixty-two tons of mineral were obtained—a percentage of 1.08—equivalent to 21.6 pounds of mineral to the ton of rock. The mineral yield in December, 1899, was 25.4 pounds, in January, 1900, 26.4 pounds.

MONTANA.

CASCADE COUNTY.

The Montana Central strike is settled and the Boston & Montana Co. is making regular daily shipments of 2500 tons of ore to Great Falls.

L. S. McLure of San Diego, Cal., has bought the Broadwater mine at Neihart from Searles of New York.

FLATHEAD COUNTY.

Near Libby, Larson & Greenough will resume work on the Buzz Saw mine.

J. Tholcke is manager of the Cabinet Queen M. Co. on Grouse mountain, near Troy.

PARK COUNTY.

Mgr. J. F. Nolan, at the St. Julien mill at Emigrant, expects to have his machinery in place and ready July 1.

The McGinnis lode, New World district, is sold to the McGinnis G. M. Co. for $30,000.

SILVER BOW COUNTY.

The Anaconda Standard hears that the Anaconda M. Co. has ordered for the immediate termination of all leases now held of company mining properties.

NEVADA.

CHURCHILL COUNTY.

For his nickel, cobalt and copper mines at Cottonwood, Geo. Lovelock is locally credited with having accepted from an English company an offer of $50,000.

ELKO COUNTY.

At the Young America, Tuscarora, mill ten more stamps are to be added.

HUMBOLDT COUNTY.

The Glasgow & Western Co. started up another smelter at Golconda last week and the third is having necessary repairs made preparatory to being fired up. The company, it is understood, has reached the conclusion that concentrating is not necessary and will soon begin three more smelters for the ores of the Adelaide and Copper canyon mines.

LINCOLN COUNTY.

At Sandy, from the Potosi mine a car of lead ore averaged 56% lead, with gold and silver values. The shipment was made to Pueblo. Bybe & Smith, who own fifty claims, are doing development work. J. R. Newberry has commenced work on the Tam o'Shanter.

LYON COUNTY.

W. J. Kelly has sold the Bluestone copper mines, 4 miles from Yerington, for $10,000.

ORMSBY COUNTY.

The Idaho-Montana Copper-Gold Mines Co. has incorporated at Carson "to operate mines and smelters in Nevada." Capital stock, $1,600,000.

STOREY COUNTY.

The Con. Cal. Va. mine shipped to the Kinkead mill during the past week 223 tons and 1600 pounds of ore, assay value $44.39 per ton. The average assay value (per battery samples) of all the ore worked at the mill during the week (175 tons) was $37.30 per ton.

Last week a reduction was made in the forces at the Belcher and Yellow Jacket mines, pending the changing of the machinery to the requirements of the electric power.

NEW MEXICO.

SANTA FE COUNTY.

At San Pedro, the S. P. G. & C. M. Co. has 150 men employed in the mine and grading for the 200-ton smelter is in course of erection, to be ready Nov. 1.

NEW HAMPSHIRE.

(Special Correspondence). — The Newfound Mica M. Co. are working here with fair success in a strong vein of ruby mica, weekly shipping some fine cut mica. This company is owned by men from Worcester, Mass. C. F. Rice is manager. They have demonstrated the value of this class of mining and are about adding to this plant several Rand steam drills, which will largely increase their output.

Alexandria, May 5.

OREGON.

BAKER COUNTY.

Jno. T. English, at Sumpter, will have seventy stamps in operation on the Golconda by October 1.

GRANT COUNTY.

Near Granite a 200-ton cyanide plant is being put in at the Cougar by Evans Larkin, the owner.

C. R. Aldrin proposes a tunnel 7x7 feet 3000 feet long through Quebec mountain.

Supt. Thomsen is operating the 10-stamp mill of the May Queen.

C. B. Preble projects putting up hoisting works on the Gray Eagle.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Homestake mine—the largest in the Black Hills—has a capital of $21,000,000, upon which it regularly pays 6% dividends. The company is about to install a $200,000 cyanide plant. It also has a water works scheme under way, which will cost $1,000,000. A ditch 15 miles long will be dug to bring the water down, and will be used to supply the mine and the cities of Deadwood and Lead with water. The Homestake is now running 700 heads of stamps, and is stamping about 2500 tons of rock daily, or nearly half as much as the Calumet & Hecla mine. It is thought likely that the Homestake will soon add 400 more stamps.

The Golden Reward G. M. Co.—the second largest—paid $800,000 in dividends in '99.

UTAH.

BEAVER COUNTY.

At the Horn Silver Co.'s property the copper ores on the 700 and 800 are opening out. From 70 to 80 tons per week of ore averaging 26% to 28% copper, 25% to 30% lead, 15 to 18 ounces silver and $1 in gold are being marketed. No high-grade copper has yet been struck on the lowest levels.

JUAB COUNTY.

The Farrel interest this week paid $690,000 for the McIntyre holdings in the Mammoth, thus securing control.

At Eureka the Bullion–Beck M. Co. has made a strike on the Moulton claim. Supt. Farnsworth has 3 feet of galena ore in the tunnel assaying 40% lead, 25 ounces silver and $2 in gold.

WASHINGTON.

FERRY COUNTY.

Republic reports a strike in the Black Tail mine, a chimney of high grade ore.

OKANOGAN COUNTY.

The American Flag mine, on the Methow river, has ore running $20 per ton in gold. The mine is reached by stage from Brewster, connecting with the stage from Coulee City and with steamers from Wenatchee.

STEVENS COUNTY.

The Northwest M. Co. has completed its survey of the Acme group, 7 miles south of Kettle Falls, five claims, upon which the company have a bond. Bad air has driven the men out of the winze.

WHITMAN COUNTY.

Near Palouse the Bishop mine, adjoining the Gold Bug, on Jerome creek, is the first mine to begin shipping, and has several hundred tons of ore on the dump ready to be worked by the smelters. Mgr. Bishop has a rate of $5 a ton from the Northern Pacific from Palouse to Everett or Tacoma, and hopes to make the first shipment June 1.

WYOMING.

J. S. Norvell of Anderson, Cal., has organized the Norvell-Pickrel C. M. Co. to develop property in that neighborhood.

FOREIGN.

BRITISH COLUMBIA.

F. Cook, of San Francisco, is installing a plant on the Sun Rise group of hydraulic leases on Pine creek below Discovery in Atlin. The plans of the Sun Rise Co. provide for the installation of four giants, the pipe to be 30 inches in diameter, the ditch, 6 miles long and 12 feet in width, to carry 7000 miners' inches. L. H. Griffith, of Seattle, is the financial representative.

J. W. McIntosh, of Nevada county, Cal., is prospecting the Race Horse and Feather group of leases on lower Pine creek below Discovery.

V. V. Bloggett of California is constructing a hydraulic plant on Wright creek, which empties into Surprise lake from the south.

The Rossland Miner says L. Merrill has a claim southeast of the I. X. L., from which comes ore carrying 4% nickel and $4 in gold.

At Greenwood district work has been resumed in the Morrison mine, Deadwood camp. F. Oliver is manager.

Camp McKinney reports resumption of ore crushing by the Waterloo mill.

On the Gold Drop mine, near Phœnix, the total development to May 1st was 2000 feet. No. 1 tunnel has 350 feet of drifts and crosscuts and a raise of 100 feet.

The Mother Lode force has been increased.

COREA.

U. S. Consul Allen writes from Seoul that employment in the mines would have to be secured before coming to Corea. The agent of the mines in America is H. A. Noble, representative Oriental Con. M. Co., San Francisco. Prospectors can not operate in Corea, and there is no employment with the mines other than on wages.

RUSSIA.

London advices deny that Hooley, the promoter, received the concessions of the gold mines in Siberia, saying that his only connection is that £7000 of the £1,000,000 capital was furnished from funds under his control.

SPAIN.

A letter from W. B. Carlyle formerly of Rossland, B. C., now superintendent of Rio Tinto mines, says. "There are 135,000,000 tons of ore in sight, of which we must extract 2,000,000 tons this year. We have a good railroad 375 miles long, thirty locomotives on the main line, fifty at the mine, and this year we will handle 5,000,000 tons of ore. There are extensive underground works. Down on the 1200-foot level, I was shown a solid body of ore 660 feet wide. There are 10,000 Spaniards at work. We pay here from 50 cents to 85 cents per day."

THE KLONDIKE.

At Forty Mile river, below Dawson, on the Yukon, five American miners have a channel 40 feet deep, 60 feet in width and 200 feet in length, to turn the water flowing through Forty Mile river and form a new channel. By turning the river out of its present bed they expect to be able to work a stretch of ground nine consecutive claims in length, which will, it is claimed, outrival anything yet discovered in the Klondike. The men have been laboring for over fifteen months constantly, and have been laughed at by every one.

The Yukon Sun has analysis of the season's work on Gold Run and Sulphur creeks. Both of these creeks, Indian river district, are wide and open, unlike Hunker and Bonanza, being no way confined, and consequently were hard to prospect. Sulphur is a creek 23 miles long, and heads from the same dome as Dominion and Hunker; Gold Run is a creek 12 miles long and heads from a dome lying 10

miles east of the Hunker and Dominion dome. Altogether there is close on 2,000,000 buckets (ten pans to the bucket) to be sluiced on Gold Run, and allowing 50 cents to the bucket, the clean-up will be in the neighborhood of $1,000,000. It is computed that there are about 750,000 buckets ready for sluicing on Sulphur claims below Discovery.

Personal.

A. B. HALL is now Supt. Granite mine, Riverside Co., Cal.

COL. J. E. DOOLITTLE has returned to San Francisco from Gold Run, Cal.

E. B. TRUE has gone to Quartzburg, Idaho, to take charge of the Iowa mill.

J. H. CONRAD, a well-known Montana miner, sails on the 25th for Cape Nome.

H. L. MUMA is now Supt. Whalen Con. C. M. Co., Alpha, Eureka county, Nev.

J. T. MCLAUGHLIN is manager San Pedro G. & C. M. Co., San Pedro, N. M.

DR. S. BOWERS, California State Mine Examiner, is sojourning in Shasta county, Cal.

SUPT. E. H. COOK of the United Globe, Ariz., mines, has returned from El Paso, Texas.

FRANKLIN FARRELL, Pres. Sioux and Utah Mining Companies, Tintic, Utah, is visiting Utah.

SUPT. CRUMMER, Republic, Wash., now has charge Black Tail, Quilp and San Poil mines.

J. W. NEILL has resumed management of the Taylor & Brunton sampler, Salt Lake City, Utah.

JNO. T. DONNELLAN has returned to Globe, Ariz., from a visit of six weeks in Colorado and Utah.

J. HUTCHINSON, Gen. manager Trade Dollar Co., has returned to Boise, Idaho, from Baker City, Or.

E. B. SESSIONS succeeds W. H. Hood in the superintendency of the Silver Shield mine, Bingham, Utah.

H. A. MATHER of New York City is in Jerome, Arizona, as secretary and assayer Verde Queen C. Co.

DUNCAN MCVICHIE has been tendered the general management of the U. S. M. Co.'s properties, Bingham, Utah.

M. C. BENTON of Cochise county takes charge at the Copper Bullion Co.'s mines in the Dragoon mountains, Arizona.

B. F. HORN, chief mining engineer, Cpugnamata mines of Chile, is inspecting the Lake Superior copper workings.

J. T. DUNCAN of Nelson, B. C., is examining mining property in the vicinity of Railroad Flat, Calaveras county, Cal.

LIEUT.-GOV. NEFF of California has returned to San Francisco from a visit to his mining property in Amador county, Cal.

BEN AND LEWIS WILLIAMS have gone to their mine near Milton, Calaveras county, Cal., to personally superintend development work.

JOHN CASE, formerly manager Great Falls, Montana, smelter, is manager Bigelow smelting interests in the Lake Superior copper region.

R. KONDO, Supt. of the Ashio copper mine, situated 120 miles from Tokio, Japan, last week visited the works of the United Verde at Jerome, and the Copper Queen at Bisbee, Ariz.

N. R. LEONARD has been appointed Pres. Montana State School of Mines, at an annual salary of $3000. The $25,000 appropriated by the Legislature for the school is now available.

CARL VAN REISCHACH went from Alameda, Cal., this week to take charge of the metallurgical department of the Mexican Ore Reduction Co., Guadalajara, State of Jalisco, Mexico.

J. S. CARTWRIGHT, agent Birmingham, England, E. & M. Co., has returned from a trip to Cochise, Co., Ariz., His company deals extensively in iron ore sent to England as ballast in tramp steamships and sailing vessels.

JOS. MCGILLIVRAY of San Francisco has returned to the Klondike via London, and when navigation opens expects to receive about 150 tons hydraulic mining machinery to work the claims in which his company is interested.

GEN. MGR. L. T. WRIGHT of the Mountain Copper Co., Shasta county, Cal., has gone to London and is locally credited with intention to advise the directors to erect a complete copper refinery at Keswick. The company now ships all its metal from the smelters to its refinery in New Jersey. It is not probable that a refinery will be built.

H. C. CALLAHAN of California, late manager Lake View Consols mine, Australia, is credited with having issued a writ for libel against Chairman Villiers of the company for the statement made at a recent meeting of that company that he kept the board entirely in the dark as to the necessity for reducing the mine's output from 30,000 ounces monthly to 12,000 ounces.

GEO. E. PRICE of Riverside, Cal., is in Dutch Guiana, South America, managing a mining enterprise for a Dutch company near Paramaribo. Mr. Price is a subscriber to this paper as well as other leading mining journals, and he states "for intelligent and legitimate reading in matters pertaining to my business I prefer the MINING AND SCIENTIFIC PRESS to all others." He writes instructing that his paper be forwarded to his new address.

Commercial Paragraphs.

MCFARLANE & CO. of Denver, Colo., recently built and shipped to Breckenridge, Colo., two Lambing excavators for work on placer grounds controlled by L. B. Lambing.

THE Pelton Water Wheel Co. has a $22,000 contract to erect a 1000 H. P. plant for the Compania Minera y Beneficiadora de Teziutlan, Teziutlan, Mexico. Four water wheels of 400 H. P. are to be sent to Lima, Peru.

THE mile length of aerial tramway, 125 buckets, with hourly capacity of ten tons of ore, erected at Lillooet, B. C., for the Toronto–Lillooet G. R. Co., was furnished and put in working operation by the Vulcan Iron Works of San Francisco.

ALMARIN B. PAUL, well known to all readers of this paper, has issued a new pamphlet, having as subjects "Mine Development," "The MacArthur-Forrest Cyanide Process," "The Hydraulic Mining Industry," "Gold in the Black Sands" and "Progress in Ore Reducing Machinery." This pamphlet is issued more with the view of advancing the interest of mining than any personal gain. It will be sent to any subscribers of the MINING AND SCIENTIFIC PRESS on forwarding the address to Mr. Paul, 27 Crocker Building, San Francisco.

Books Received.

Twelve volumes, twentieth annual report U. S. Geological Survey, the usual priceless compendium of latest practical scientific data concerning the economic geology of the nation. Accompanying the work is a special monograph by Waldemar Lindgren, a 257-page volume on the gold and silver veins of Silver City, De Lamar and other mining districts in Idaho, profusely embellished with maps and illustrations, and going into minute detail of the geology and development of that entire region.

"Preliminary report on the Cape Nome Gold Region of Alaska," with maps and illustrations by F. C. Schrader and A. H. Brooks, published by the U. S. Geological Survey, a timely government publication of late authentic data concerning the newest El Dorado.

"New Hydraulics," by M. E. Sullivan, 300 pages, octavo, a scientific discussion of the entire subject, natural laws, etc., and a multitude of tables and formulas, with practical examples of their use, and unusual attention to details of construction and cost. Published by the Mining Reporter, Denver, Colo.

List of U. S. Patents for Pacific Coast Inventors.

Latest Market Reports.

SAN FRANCISCO, May 17, 1900.

SILVER—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 49c.

Secretary Gage has completed plans for discovery where the $400,000,000 in gold coined since the early seventies has disappeared to. Basing his figures on the amount of gold coined, Secretary Gage said that there should be at the Treasury, Sub-treasuries and banks in the country about $1,000,000,000 of gold. Investigation shows that of this $400,000,000 has entirely disappeared. Inquiries have been sent to all the manufacturing jewelers in the country asking for information regarding the quantity, kind and value of gold used in the last year. In this way it is hoped to obtain some traces of the gold apparently withdrawn from circulation.

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16.50; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.25; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $3.97½; St. Louis, $4.00; San Francisco 4¼c, carload lots, 4¼c, 1000 to 4000 lbs.; pipe 7, sheet 8, bar 6c. London, Soft Spanish Lead, £17 5s = 3.75c per lb.

SPELTER. — New York, $4.45; St. Louis, $4.55; San Francisco, ton lots, 5¼c; 100-lb lots, 6c.

ANTIMONY. — New York, 10c; San Francisco, 1000-lb lots, 11c; 300 to 500 lbs., 12@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 1, 10c.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 40@45c ℔ lb.

IRON. — Pittsburg, pig, No. 2, foundry, $21.50; gray forge, $20.00; San Francisco, bar, per lb., 3¼c.

STEEL. — Billets, Pittsburg, $29.50; sheet bars, $34; San Francisco, bar, 11c to 18c per lb.

QUICKSILVER. — New York, $51.00; London, £9 10s; San Francisco, local, $51.50 ℔ flask of 76½ lbs. Export rates withdrawn.

PLATINUM.— San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

MAGNESIUM.—New York, $3.00 ℔ lb.; San Francisco, $4.00.

TUNGSTEN.—New York, ℔ lb., $1; San Francisco, $1.25.

FERRO-TUNGSTEN. — New York, 37%, 40c; San Francisco, 75c (60%).

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

FERRO-MANGANESE. — Pittsburg, 80%, $125.

ZINC.—San Francisco, 6c; slab, 6¼c; bar, 8c.

SOLDER. — Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17½c.

TIN.—New York, pig, $28.75; San Francisco, ton lots, 31c; 1000 lbs., 32c; 500 lbs., 33c; less, 34c; bar tin, ℔ lb, 37c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

NICKEL.—New York, 45@50c ℔ lb.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ℔ set; 14 oz., 40s., 10½c.

COAL. — San Francisco coast, yard prices: Wellington, $8; Seattle, $7.00; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 33@35c ℔ lb.; carloads, 31@32c; in 10-lb. tins, 40c; sulphuric acid, 2¼c ℔ lb. 66% B; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ENGINE SPEED REGULATOR.—C. A. Huffmaster, San Leandro, Cal. No. 649,167. Dated May 8, 1900. The object of this invention is to provide a means for varying the speed of an engine or other machine, with relation to that of the governor by which it is normally controlled so that without changing the speed of the governor that of the engine may be varied within certain limits. The governor insures a certain regularity of motion independent of the load, which may be a constantly varying one. It is however desirable in some cases to vary the speed of the engine, and, as the governor is set to operate and control the engine when running at a certain rate of speed, this engine is designed to vary the conditions and connections between the governor and the engine that the speed of the engine may be changed without altering the speed of the governor. This change may be effected by means of bevel-faced pulleys between the governor and the engine, and a means for moving one pulley towards or from the center of its companion, at the same time allowing one of the pulleys to yield laterally during its adjustment over the face of the other pulley.

AUTOMATIC WEIGHING MACHINE.—George Hoepner, Chicago, Ill., assignor to the Union Scale and Manufacturing Company of Sacramento, Cal. No. 648,617. Dated May 1, 1900. This invention relates to improvements in machines of that class which are designed to weigh powdered, granular or similar substances, and to deliver such substances in regular quantities into such receptacles as may be desired. It consists of a weighing receptacle, a yoke from which it is suspended having a scale beam projecting from it, a source of supply, means for delivering the material from the source of supply into the weighing receptable, a tilting diaphragm movable to form receiving chambers alternately upon opposite sides, fulcrumed bottoms connected and movable with the diaphragm, and notched segments fulcrumed on the axis of the bottoms, a spring-pressed latch adapted to engage the notches in the segment and hold the latter and the bottoms in either position to which they are moved, an electro magnet, an armature having a rod fixed to it and adapted to engage and lift the latch to release the segment and bottoms, and an electric circuit including a fixed contact and a contact carried by the scale beam whereby the magnet is energized when the weight in the receptacle causes the latter to move.

Obituary.

CHAS. P. HAUGHIAN, president Chrome Steel Works of Brooklyn, N. Y., died at his home, 149 Hewes St., that city, on the 2nd inst. A native of Armagh, Ireland, he had lived in Brooklyn fifty years—since his eighth year. He was the original producer of chrome steel in this country, and in 1865 founded the establishment in Brooklyn, known as the Chrome Steel Works, of which H. D. Morris has for many years been the San Francisco agent. Mr. Haughian had but recently returned from a visit to San Francisco and was arranging for an extended itinerary through Mexico. He possessed in an eminent degree the faculty of making and retaining friends, was a member of fourteen clubs and was deservedly held in high esteem by a large number of business associates. A brother and sister survive him.

WANTED.

A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.

Address: **EDWARD N. BREITUNG,**
MARQUETTE, MICH.

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

34-36 STEUART ST., SAN FRANCISCO, CAL.....AGENTS FOR PACIFIC COAST.

Vertical. Sizes 1½ to 12 in.

Ever Know an Engine Has Lungs?
The cylinder of an engine corresponds with lung action and in some ways is afflicted with lung trouble. For instance, too much moisture in the steam cylinder will cause more trouble than a damp atmosphere to a consumptive.

AUSTIN Separators

Horizontal. Sizes 1½ to 12 in.

Are the proper medicine. They eliminate all moisture and ensure the greatest efficiency to the engine. Shipped on 30 days' trial to responsible parties anywhere in the United States and freight paid both ways if not satisfactory.
SEND FOR OUR NEW CATALOGUE.

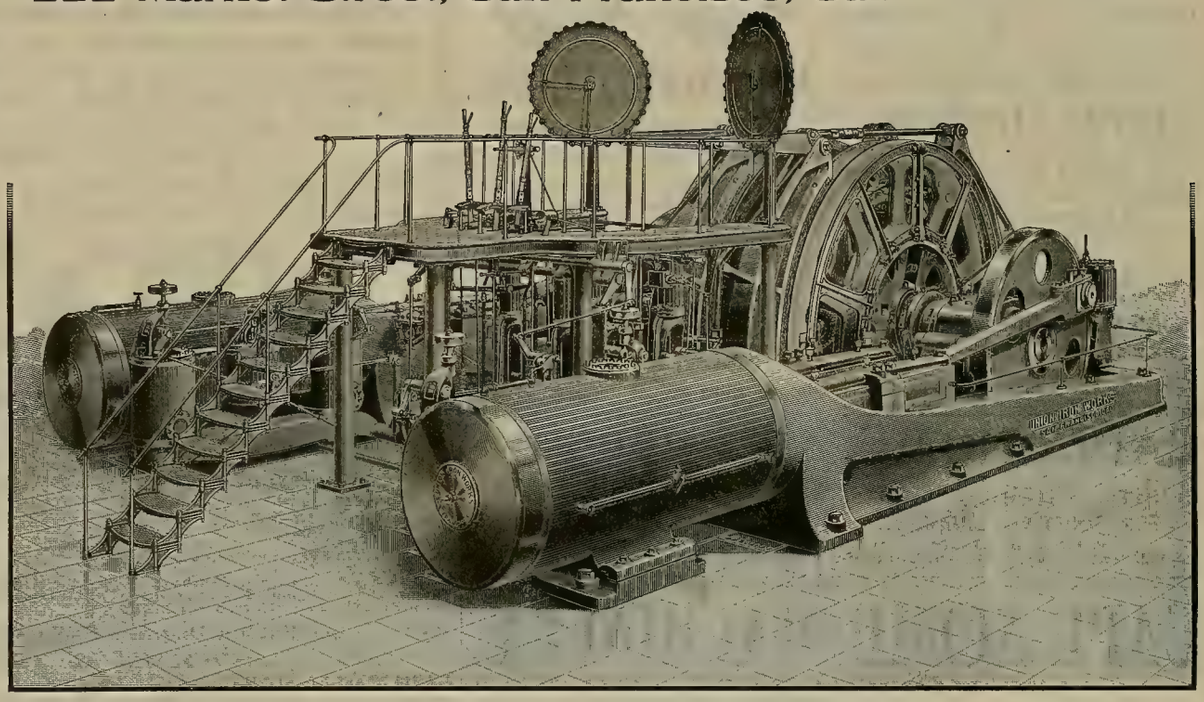
UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

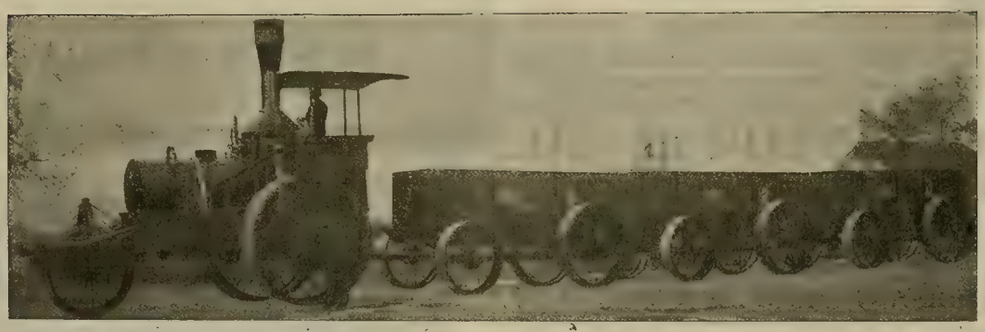


30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.



Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

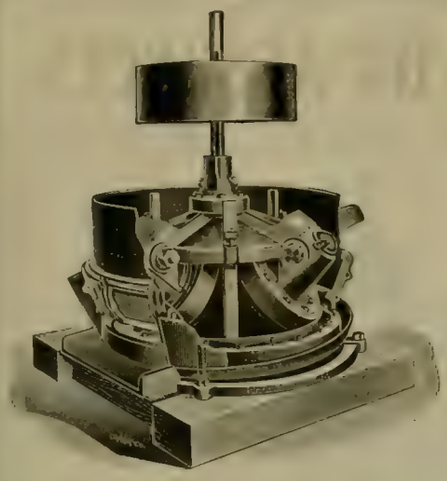
CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.



The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO.,

San Leandro, Cal., U. S. A.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

PNEUMATIC SEPARATOR.

Weight, 160 lbs.; capacity, 15 to 30 tons per day.

These machines save the gold WITHOUT THE USE OF WATER, enabling the miner to thoroughly prospect on the spot and successfully work the rich benches and gulches, when water is not convenient. The separation is accomplished by graduated air current. These machines are especially adapted for saving flour and beach gold. No quicksilver being used, the iron-coated beach gold of Cape Nome, so difficult to amalgamate, is saved with these machines as easily as though the gold was clean. Send for descriptive circulars.

Buyers of Gold, Silver, Lead and Copper Ores, Gold Concentrates, Lead Bullion, Cyanide Product, Etc.

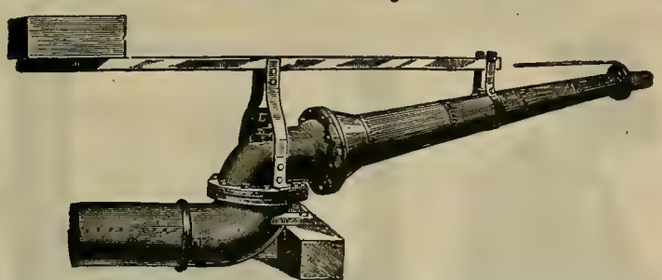
ORE AND BULLION ASSAYERS.

Works at VALLEJO JUNCTION, CAL. Office, 416 MONTGOMERY ST., SAN FRANCISCO, CAL.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

THE UNION GAS ENGINE CO.

—BUILD THE—



"Union" Gas Engines,

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office, 244 First Street. Works, Corner First and Clementina Streets. SAN FRANCISCO, CAL.

Double-Jointed Ball-Bearing Hydraulic Giants.

The above presents an improved **Double-Jointed Ball-Bearing Hydraulic Giant** which we build. The improvement consists of the introduction of a **Ball Bearing** by which the pressure of the water is reduced to a minimum and the direction of the nozzle changed at will with ease.
Catalogues and prices of our specialties of HYDRAULIC MINING MACHINERY furnished upon application. **JOSHUA HENDY MACHINE WORKS, 38 to 44 Fremont St., San Francisco, Cal.**

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B to

No. 1 Special Button Balance with 8-inch beam. Sensibility 1-200 Milligramme. For very accurate weighings. Among the well-known smelters using this balance are the following: GLOBE SMELTING & REFINING CO., Denver, Colo., U. S. A.; CANADIAN SMELTING WORKS, Trail, B. C.; MT. LYELL MINING & RAILWAY CO.'S Reduction Works, Penghana, Tasmania.

A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

ASSESSMENT NOTICES.

MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of April, 1900, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of June, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 25th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of May, 1900, an assessment (No. 5) of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 11th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—213 Jackson street, San Francisco, Cal.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 23) levied on the 2nd day of April, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.

THE LITTLE ALASKA GOLD WASHER.

Price $6. Saves the Gold. Weighs only 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

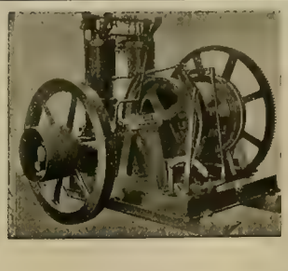
BRANCHES: NEW YORK, 26 Cortlandt St.; PHILADELPHIA, Bourse Bldg.; LONDON, S. E., 35 Gt. Dover St.; MEXICO CITY, Puente de San Francisco No. 6.



∴The Two Essentials.∴

The two essentials for a successful engine are Steam and a **Detroit Lubricator.** The steam furnishes the necessary energy and the **Detroit Lubricator** insures that almost all of this energy will be converted into useful work—not wasted in overcoming friction. We make different styles of lubricators to meet the different conditions existing in the various types of engines, so that all are enabled to work at their best and waste and wear are reduced to the minimum

Our new catalogue is just out. It describes our full line of **Sight Feed Lubricators, Glass and Brass Oil Pumps, Glass and Brass Oilers, Multiple Oilers, Oiling Devices, Valves, Etc.,** and it will be sent to any part of the world on application.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. The belt will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 2079.— VOLUME LXXX. Number 21. SAN FRANCISCO, SATURDAY, MAY 26, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Producing Electrolytic Copper.

Starting with the ore, a preliminary dressing operation may or may not be required, depending upon the nature of the ore and the percentage of copper which it contains. Assuming the ore or mixtures of ores to be in such a condition as to readily yield up its copper in a smelting operation, the first step in the process is to produce a matte, or regulus. Depending upon the richness of this matte, one or more further smelting operations are necessary to bring it into a sufficiently pure state to render it fit for the subsequent electrolytic treatment—that is, the crude copper must be smelted up to a point at which it contains, say, 98% or more of metallic copper. The copper ores selected for treatment by this process always contain gold and silver in certain quantities; practically the whole of the precious metals are, during the process of smelting, washed down, as it were, from the ore by the regulus, and they tenaciously adhere to their association with the copper throughout the various subsequent smelting operations, and are still retained in admixture or alloy when the crude copper has been brought up to the required standard of purity of 98%. So little as 1 dwt. of gold and 2 ozs. of silver in a ton of the original ore are paying quantities, and it strongly appeals to one's admiration of the application of exact science to metallurgy when it is seen that these quantities represent, say, one part of gold in every 700,000 parts of ore and one part of silver in, say, every 30,000 parts of ore; that the recovery or loss of these apparently infinitesimal quantities of the precious metals should, in some cases, make the difference between a profit and loss to the refiner.

After the smelting operations alluded to the crude copper is ready for the purely electro-chemical treatment, but it is first necessary to cast the molten metal into plates of a convenient size and shape. These usually take the form of a rectangle about 3 feet long by 2 feet wide by 1 inch thick; they are suspended from copper rods resting on the top of a suitable tank, and have opposed to them in the same tank, but separated by a space of 1½ inches to 2 inches, thin copper sheets of like size, which are also suspended from copper rods similar to those from which the plates are suspended, care being taken that the two sets of rods are electrically insulated from each other. When the tank has been charged with a sufficient number of these pairs of crude copper plates and thin sheets, the tanks are filled with a liquid consisting of water having in solution the proper proportions of sulphate of copper and sulphuric acid to such a height that the plates and sheets are entirely submerged, with the exception of a strip along the tops. The system of rods supporting the plates is then connected to the positive pole of an electrical generator, and the system of rods supporting the thin sheets is put in similar electrical connection with the negative pole of the same source of electricity. The whole system being thus complete, a current of electricity passes from the plates through the intervening stratum of liquid to the surface of the sheets. A casual observer of such an apparatus would conclude that nothing was taking place within the tank, since there is an entire absence of noise and smell, and no evidence whatever of any motion; but nevertheless a remarkable series of chemical actions and reactions are constantly in progress so long as the current of electricity is passing, the ultimate result being that the whole of the copper contained in the crude plates is transferred by solution and deposition to the surfaces of the thin sheets, where it reappears in an absolutely pure form, all the impurities—including the precious metals—having been left behind at the surfaces of the crude plates, from which, as the plates gradually dissolve away, the impurities fall to the bottom of the tank in the form of a mud or slime. These slimes, containing all the gold and silver from the original ore in a highly concentrated form, are very valuable, and are either treated for the separation and recovery of the precious metals by the refiners themselves or sold to the bullion refiners. Here, then, we have a process which is now being worked on a colossal scale, recovering minute quantities of precious metals associated with copper with more than the certainty and accuracy of the assayer's crucible, producing simultaneously copper which for purity cannot be exceeded even by copper produced in a laboratory by the application of scientific methods of the highest degree of refinement, and at a working cost per ton of product not approached by older methods.

THE simplicity of truthfulness is a merit in a mining prospectus, and more convincing than meretricious statements. Exaggeration exhausts itself and arouses instinctive distrust. Understatement is better than bombast for convincing those whom it is worth while to convince.

ON the 24th inst., this journal was forty years old, having been steadily issued since the first number appeared, May 24th, 1860. Probably nowhere is there a finer compendium of the progress of scientific mining and metallurgy than in the eighty volumes that have piled up during the two score years of its publication.

THE problem of barrier construction in the Yuba river, California, has been simplified and advanced by the additional appropriation in the river and harbor bill. The entire elaborate plan involves the expenditure of about $800,000, of which amount $500,000 is immediately available. The matter has been long and vexatiously delayed, but despite the multiplicity of their duties the U. S. engineers who compose the Debris Commission have steadily kept the intent in view of satisfactorily solving the difficult and unusual requirements of this special case, and are now in a fair way to give practical shape to the project.

IN San Francisco on the 15th inst. was decided an important point in State mining law by the U. S. Circuit Court of Appeals. The Gold Hill Mining Co., operating in California, incorporated under the laws of West Virginia, had successfully fought foreclosure in the lower courts, claiming exemption from the operation of a California statute, because of being a foreign corporation. A California statute enacted in 1880 provides that no mining incorporation in California may mortgage or incumber its property without consent of two-thirds of the stockholders. The Circuit Court of Appeals decides that this statute applies to foreign corporations doing business in California, arguing that it is contrary to public benefit to permit a foreign corporation to transact business in California under conditions more favorable or less restrictive than those applying to domestic incorporations.

Two Necessary Measures.

There is to be a Mining Congress at Milwaukee, Wis., on the 19th–23rd prox., which is expected to be of some importance to miners. The first session was held in Denver, Colo.; the second in Salt Lake City, Utah. The third goes farther east, we are told, to enlist the sympathy and attention of Eastern delegates in the great and necessary movement having for its object the establishment of a Cabinet Department of Mines and Mining. Anything that the Milwaukee gathering can do in that regard will be of just so much aid. Its two predecessors unanimously favored the idea. All that stands in the way is popular inertia. No one actively opposes it, but the project necessarily involves so much unanimity of action and the subject affects so extensive an area that it is a very slow process to get the requisite number of men to give the matter sufficient intelligent consideration to keep from becoming dormant.

For about five years this paper labored to get the sentiment of the mining world crystallized to the point of procuring the necessary legislation to make the idea of a cabinet Department of Mines and Mining effective, but we dislike to appear to have any hobby, and the pressing present demands upon our weekly space preclude possibility of more than occasional reference to this important subject. It is the province and the privilege, and should be the pleasure and the purpose of the Milwaukee meeting to push this project. That the idea will ultimately succeed is certain. It is now and has been for years a prime necessity. The arguments adduced by this paper for the creation of the department have been unanswered because unanswerable; but while there is a tacit acquiescence everywhere, every one seems waiting for further missionary work to be done by some one who has more time than the average busy man is ever vouchsafed.

Of equal importance is another matter that this paper has been urging for several years, but which has not met with the favorable unanimity of opinion accorded the one mentioned above—we refer to the revision of U. S. mining law, which is evolutionary or revolutionary, just as the miner may view it. We have repeatedly pointed out the weakness and the absurdity of our system of Federal mining law, and advocated a radical change in several Federal provisions, notably the adoption of vertical boundaries and the abolition of extra-lateral rights. This paper is always willing to accord to others the same degree of consistency that it claims for itself, and readily understands how conservatism, custom and prejudice honestly maintained may militate against the changes it proposes in our national system of mining law, but at times we confess to a slight degree of impatience at the untoward attitude and vexatious delay in securing what is so manifestly a necessity to the miners of America, viz., the abolition of the present requirements of U. S. mining law regarding discovery, assessment work, boundary lines, apexes and extra-lateral rights. The last lies at the root of all the evils that in that field beset the miner, and is the chief thing that should be abolished.

The Milwaukee congress may be able to help on this necessary work as in the case of the creation of a cabinet Department of Mines and Mining its Denver and Salt Lake predecessors pronounced in favor of the policy advocated by this paper regarding the revision of Federal mining law. Doubtless there will be much to take up the time and consideration of the attendant delegates, but it is our opinion that the Milwaukee Convention can do the mining industry great service if it shall succeed in advancing the two measures here suggested upon the calendar of the greatest tribunal on earth—public opinion.

THE exodus to the North that began in 1897, and is now as great as then, is depleting the mining States of many of their best miners, many of whom will not return. The great expenditure consequent upon this movement has already been commented upon; a more serious economic question is who shall take the places of these men, skilled in every department of scientific mining. Their departure is a manifest loss to the mining industry of the States from whence they go. The charm of "a new region" lures them from finer conditions existent in nearly every locality that they leave, and who will fill their places is an important problem. Those who swell the tide of travel to the far North do their talking and thinking in English; it may be that those who take their places will be different in some important regards. Of course, the work of development will go on, even if men of lesser intelligence are imported to fill the places of the departing American miners. There is enough of the turbulent element now in the mines of this west half of America, and it were not well to have the number of those whose education and instincts are not in harmony with our institutions suddenly increased.

OVER $125,000 was contributed to the relief fund for the families of the miners killed in the Pleasant Valley coal mines, Scofield, Utah. W. F. Colton, the company's treasurer, sends us a statement wherein Utah's State Mine Inspector, Gomer Thomas, denies a previous statement credited to him to the effect that the disaster was caused by the neglect of the Pleasant Valley Co. Much has been said as to the real cause of the dreadful occurrence, and if any of the comment will aid in any degree in the prevention of such disasters, it has not been said in vain. Apart from extraneous "causes," it is apparent that the disaster was due to a dust explosion. If the dust was fired, as stated, by the explosion of powder which should not have been stored underground, then negligence is justly chargeable to any corporation that knowing the circumstances would permit of such underground storage, a custom considered indefensible by many mining companies. The deaths were directly due to the carbonic oxide generated by the dust explosion, which deranged the admirable ventilating system of the mine, as such explosions usually do. The lesson to be learned from the sad affair is an oft-repeated one, viz., that dust is explosive whether it be in a mine, a flour mill or a factory, and that the safety of employes, no less than the imminence of disaster to property, requires universal guarding against so insidious and deadly a substance. If it can be more generally understood or realized that under certain circumstances dust may be as deadly as dynamite, there will be fewer repetitions of the Scofield horror.

A DROP of nearly 1 cent per pound in the price of lead during the month is noticeable. While the present price is considerably better than that of August 2, 1896, when it was $2.50 per hundred pounds, yet its sudden tumble from the $4.75 of a few weeks ago is dispiriting to producers. The cause of the drop is purely arbitrary; it is done solely because the controlling trust has the power to put the price up or down at the will of its directors. It is now characteristic of the managers of any of the great trusts to use their power to affect stocks, as in the recent case of J. W. Gates of the American Steel & Wire Co. There is no legitimate trade reason for the drop in lead. There is a steady demand, and the uses to which it is adapted are multiplying. Tariff protection is a good thing, but its good effects should be extended to the ore producers. When the smelter combine was formed one of the arguments was that it would reduce the cost to the consumer and permit the miner to get more for his ore. The result is just the reverse—the consumer is paying more, the miner getting less. The import duty is a help, but its helpful effect should be more mutual. Just now it is decidedly one-sided.

"TRUST" methods were recently well illustrated in the case of the American Smelting & Refining Co., in Colorado, which was unable after many weeks of controversy with producing miners to determine whether it could or could not pay $20 per ounce for gold, but twenty-four hours after the Guggenheims had announced their intent to pay that amount the trust managers discovered that they could also do so. The Guggenheims in Colorado seem to be useful as discouragers of hesitancy.

CALIFORNIA experience was repeated in Cripple Creek, Colo., last week. A miner coming off shift at the Independence mine was found to have several gold ore specimens secreted on his person, which he admitted having taken out while at work in the mine. He was arrested, but on trial was discharged, the court holding that no value was placed upon the ore stolen, and the witnesses for the defense were not able to swear that the ore in evidence was Independence ore.

Concentrates.

AN earthen dam 70 feet high should have a top width of 20 feet.

A 4-INCH iron pipe 10 yards long will hold about 160 pounds water.

A CISTERN or tank, inside measurement 9½ feet diameter, 12 feet deep, will hold 200 barrels.

THERE is no California State tax on the issue of certificates of stock in stock corporations.

A CALIFORNIA vara is 33.372 inches in length, a Mexican vara 32.992 inches, a Spanish vara 33.384 inches.

A 100-ACRE reservoir of water would require an inflow of ¾ cubic foot per second to offset loss by evaporation.

THE locator of a mining claim any time in 1900 has until Dec. 31, 1901, to do the required $100 assessment work.

ASPHALT LACQUER, laid on thin, is a good coating for iron pipe. Zinc oxide in it will color gray: red lead, brown.

BEFORE the South African war the annual consumption of giant powder on the Witwatersrand was about 250,000 cases.

ABANDONMENT or relinquishment of part of a mining location does not affect the right of the locator to the remainder of the claim.

BY chemical action in a cell electricity has been generated direct from carbon, but only as a laboratory experiment, not commercially.

THE Copper Queen Co., Bisbee, Arizona, purifies water for free use of its employes. After distillation it is pumped into tanks to cool.

THE specific gravity of the earth is 5.52765: that is, the earth weighs about five and one-half times that of a globe of water of the same size.

THE theoretical horse power supplied by one miner's inch of water is represented by the product of the head of water in feet and the decimal 0.0024147.

ELECTRICITY is a form that energy may assume while undergoing transformation from the mechanical or the chemical form to the heat form, or the reverse.

WHERE, in application for patent, the names of adjoining claims are designated, the mention should include unsurveyed as well as surveyed claims.

COLORADO mines and mining property are taxable. It is the customary rule to assess a producing mine or claim on one-fifth the gross proceeds of the preceding year.

THE forty-nine incorporated companies on the Comstock have levied assessments aggregating $80,000,000, and have paid in dividends an aggregate of $125,000,000.

THE amount of coal gas needed to maintain an ordinary fireclay muffle furnace need not exceed 10 cubic feet per hour for every 10 square inches of floor area of the muffle.

IT were idle to discuss any claims for circular shafts in metal mining in this country; the rectangular shaft has long been proved to be cheaper, and more efficient and convenient.

NO ATTENTION should be paid to vendors or makers of "electric belts" for the treatment or prevention of diseases. They impose upon the ignorance or credulity of their dupes.

MILLMEN give different grades for copper or silver plates to the concentrator. For full width plates 1¾-inch fall to the foot is recommended; 1 5/8 would probably work well for 16-inch width plates.

APPLICATION for patent does not absolve or relieve the claim owner from requisite annual assessment work. When the application is made the matter should be put through with all possible dispatch.

THE cheapest advertising is that which gives the largest amount of results in proportion to the amount expended. "Cheapness is not regulated by what you pay, but by what you get for what you pay."

THIS is not a "puzzle department," and catch questions are not considered. An honest effort is made to secure requested information on topics of general interest to miners, metallurgists, electricians and engineers.

PURE metals are tasteless; when united with other bodies the combination has a marked, usually an unpleasant, taste. All the metals are combustible, except the precious metals, gold, silver, platinum, osmium, etc.

WHENEVER or wherever, in the United States, local mining regulations or State mining law conflict in any way with United States statutes, the latter override all else. In mining matters the federal law is supreme.

THERE is probably more possibility of economical and satisfactory working in the gas engine than in any other form of power for the miner. It can produce and furnish power in regions almost inaccessible to any other form of applied energy.

DRY JIGGING requires very accurate sizing of the ore and great uniformity of the blast. Coarse ore requires currents of high velocity, when the great advantages of air jigging ordinarily disappear, except in arid regions where water is scarce and costly.

THE quantity of cyanide to be used per ton of ore must be determined entirely by intelligent experiment based upon the character of the ore and the experience of others as related at such length and with such minute detail by cyanide experts herein. Dilute solution is usually satisfactory. At the Sacramento, Utah, cyanide plant, about five ounces cyanide per ton of ore gives successful result.

BISMUTH is not an uncommon find in many parts of this region. Its profitable production is hampered by a European "ring," which controls output and production. It is mostly reduced in Saxony and London. It is quoted at $1.50 per pound for the sub-nitrate this week.

AN interest in a mining claim prior to the payment of any money for the granting of a U. S. patent for the land is merely a right to the exclusive possession of the ground based upon conditions subsequent; a failure to fulfill such conditions forfeits the locators' interest in the claim.

WHEN the proportion of silver in gold is 20%, the alloy is termed electrum. Besides silver, iron, rhodium, bismuth, palladium, platinum and antimony are found associated with gold. Rhodic gold, containing 40% gold, is found in Mexico. Bismuthic gold is termed maldonite. Palladic gold is known as porpezite.

IN the issue of April 28 appeared a misstatement in an article on chemical and physical properties of quicksilver, where on page 462 the statements regarding the weight of the flask and the amount of quicksilver therein used should, of course, have been 13 to 15 pounds weight for the flask and 76½ pounds weight of mercury therein.

IT is noticeable how much coal is allowed to remain unworked in order to serve as a support to the surface; but though repeated attempts have been made to devise a system of working which would render unnecessary the use of safety pillars, no satisfactory solution has ever yet been found, and the way in vogue a hundred years ago still prevails.

WHEN, in treating ore by the cyanide process, the consumption of cyanide is high, the cause may be determined by an analysis of the cyanide solution. For every part of cyanide rendered inoperative, a corresponding proportion of metal enters solution. Thus, one part by weight of iron consumes seven parts by weight of potassium cyanide.

WHEN less than 20 H. P. is required, it would hardly pay to install electric apparatus, for the smaller the plant the less its proportionate efficiency and the greater the relative cost of the electrical H. P. per hour. The better way, if practicable in such a case, would be to buy power. A plant with a theoretical capacity of producing 40 H. P. should be capable of furnishing 30 H. P. for practical work.

A MINING PROPERTY in California can not be attached or held for any debt contracted by its bonder or leaser if the owners have given due public notice that they would not be responsible for labor or supplies furnished such bonder or leaser. "Due public notice" would consist in stating the exact facts connected therewith, in writing, posting such notice conspicuously on the premises and publishing it in the nearest newspapers.

"THE principle of Archimedes" is that every body immersed in a fluid is pushed upwards by a pressure equal to the displaced fluid. Thus, a cubic foot of any substance, immersed in water, is urged upwards by a pressure of 62.4 pounds, the latter being the weight of 1 cubic foot of water. It follows that the weight of a body immersed in a fluid is diminished by an amount equal to the weight of the fluid displaced, and that, if the body is lighter than the fluid, it will float.

AT Lucknow, N. S. W., the Wentworth mill man's plan of placing quicksilver in the mortar is as follows: Three pieces of wood, 8 inches wide, 12 inches long, 2 inches thick, have thirty-two holes, 1 inch deep, bored in each of them. Each hole takes a 2-ounce vial. The mill man puts the required quantity of quicksilver in each little bottle, the battery man emptying one bottle in each mortar every hour, and putting it back in its hole upside down; each block of wood lasts eight hours—one shift.

NITRATE OF LEAD is the cheapest disinfectant known that fulfills its intent. It does not, however, prevent putrefaction. Chloride of lead is much more effective in all directions. It is made by dissolving a small teaspoonful of nitrate of lead in a pint of boiling water, then dissolving two teaspoonsfuls of common salt in eight quarts of water. When both are thoroughly dissolved mix the solutions. When the sediment has settled there will be two gallons clear fluid, which is a saturated solution of chloride of lead in water. A pound of nitrate of lead will make several barrels of the liquid, and costs about 70 cents.

THE best method of disposing of slag from a furnace is by granulation in a current of water, the slag being simply allowed to overflow from the forehearth into a trough with a rapidly flowing stream of water, being immediately granulated and carried away to a convenient point. Where water is not available the Nesmith slag trucks furnish a good method, consisting of two large pots on a truck so arranged that they can be swung out to the side and dumped on the outside of the track, the track being placed along the edge of the slag dump, and moved out as the dump extends.

IN giant powder over a year old the glycerine in it is liable to crystallize after that time, and the presence of a crystal in a stick of powder makes its handling dangerous. A scratching of that crystal, a jar of the stick, or a rubbing of one stick against another is likely to produce an explosion. The best powder is that about six months old. Before that time the glycerine is liable to be soft. There is also danger of getting new powder too warm and melting the glycerine. A drop falling an almost imperceptible difference will at once explode, and its concussion will be enough to explode all. Giant powder will sometimes burn without exploding, but the starting of a single drop of the glycerine it contains, either by exciting the crystal when it is too old, or the melted drop when it is too new, is what does the mischief.

IN chlorination, lead in the ore occasions an extra consumption of chlorine, though, of course, a heavy galena percentage in gold ore concentrates usually indicates considerable accompanying silver, which, in chlorination, is not wholly satisfactory. Unless a chloridized roast is used, lead, even in considerable quantity, does not materially affect the fineness of the precipitate, but the addition of even a small amount of salt to the roasting ore converts large quantities of lead into chloride, which, being dissolved and finding its way into the gold tanks, is there thrown down as sulphate, to the great deterioration of the gold precipitate, the result being a very base bar.

ANY ONE having made an invention in order to obtain a patent therefor must execute and file in the Patent Office an application for the same, together with $15, the first Government fee. An application consists of a petition setting forth the invention and praying for the grant of the letters patent, a specification describing the invention, specifically claiming the new features, a drawing illustrating the invention, and an oath which must set forth that the invention has not been in public use or on sale or described in any publication for more than two years before the date of the application, and for which no foreign patent has been granted for more than seven months. Upon the receipt of the application it is sent to one of the thirty-six divisions of the Patent Office to which by its nature it belongs. In due course it is taken up for examination to determine whether it is new and useful. If found to be new, an application is allowed the applicant. He is notified thereof and is given six months in which to pay the final Government fee of $20, and the patent is issued within three weeks after the final bill is paid. If the application is found to lack novelty a letter is written to the applicant, pointing out the objections and referring him to any prior patents or publications which may have a bearing on the case. A patent, if for a mechanical invention, is granted for seventeen years. Other patents are granted for three and one-half, seven and fourteen years, the Government fee being respectively $10, $15 and $30. To get things right it is well to employ a competent and experienced patent lawyer.

HYDROGEN is the lightest of known elementary substances, and therefore used as the unit of weight for all the others. The atomic weight of hydrogen is taken as unity and that of oxygen, for instance, as 16. Of equal volumes of the two gases under similar conditions the oxygen will weigh sixteen times as much as the hydrogen, whether it be pounds, ounces or milligrams. There is another property of the elements entirely independent of their relative weights, which is termed their "valency," or relative value. Thus if the nickel were taken as our unit of money value, the valency of a dime would be 2, of a quarter 5, and of a dollar 20. Among the elements, hydrogen is also taken as the unit value, and its valency is therefore 1. The valency of oxygen is 2; of silver, which is much heavier 1, and of zinc 2, which means that in chemical reactions where atoms are exchanging places 1 atom of oxygen or of zinc can replace two atoms of hydrogen or of silver. The electro-chemical equivalent of any metal is the weight of that metal that can be electrolytically deposited from solution by an ampere of current passing for one second. The figure 0.001118 is therefore the electro-chemical equivalent of silver. The chemical equivalent of any metal is its atomic weight divided by its valency. Thus the atomic weight of silver is 107.67, i. e., the vapor of silver is 107.67 times as heavy as hydrogen gas at the same temperature and pressure. The valency of silver is 1, therefore the chemical equivalent of silver is the same as its atomic weight. The atomic weight of zinc is 64.9, but its valency is 2. Its chemical equivalent is therefore $\frac{64.9}{2} = 32.45$. The electro-chemical equivalent of any metal is found by multiplying the electro-chemical equivalent of hydrogen by the chemical equivalent of the metal. Since the chemical equivalent of silver is 107.67 times as great as that of hydrogen, the electro-chemical equivalent of the latter will be $\frac{0.001118}{107.67} = 0.0000103835$. Having the electro-chemical equivalent of hydrogen, one can determine the electro-chemical equivalent of any other element by multiplying this by the chemical equivalent of that element: For instance the chemical equivalent of zinc is 32.45: its electro-chemical equivalent is therefore $0.0000103835 \times 32.45 = 0.000336944575$, which means that 1 ampere will electrolytically deposit zinc from solution at the rate of 0.000336944575 grams per second. This law is a definite one, and, knowing the electro-chemical equivalent of hydrogen, the atomic weight of any element and its valency, one can calculate the weight of that element that any current will electrolytically set free during any period of time. This law is the basis of all electro-metallurgical processes depending upon purely electrolytic action, but does not hold for those processes depending upon electrically developed heat as distinguished from electrolytic action.

Working Over An Old Dump.

Written for the MINING AND SCIENTIFIC PRESS.

At Plymouth, Amador Co., Cal., is now being worked over the old dumps of the Plymouth Consolidated M. Co., which is of double interest, first, because of the economical working of the mine in the first instance, and, second, because though the property was worked closely and economically, yet now another company finds value and profit in working over what was left when the ground was originally operated on with a record noted for fine work.

The Empire, Amador Pacific and Plymouth mining companies were consolidated after a production of gold to the amount of $2,500,000. Fifty-five dividends in all were paid, averaging $40,000 each, a total of $2,200,000. The average value of the ore in the last year operated was $7.59 per ton.

The principal mine consisted of an immense chimney of ribbon quartz, averaging 40 feet wide and 375 feet long. There were four shafts, three following the vein, the fourth vertical. The property was mined to a depth of 1700 feet. There were two mills, with 160 stamps, crushing 400 tons per day, being at that time the largest plant of the kind in California. The length of the ore shoot was about 800 feet, the hanging and foot walls of black slate, a black gouge accompanying each wall. The mine produced about 18,000 gallons of water per day. The ore was free milling, with 1½% sulphurets. The plant was destroyed by fire about ten years ago, when the owners turned their attention to even still more valuable property, and work was abandoned.

A description of the process employed by the old company will be of present interest in connection with an appended account of present method of working the old dump:

The ore, as it was raised from the mine, had an

Empire Dump, New Western M. & R. Co., Plymouth, Cal.

average assay value of $11 per ton, chiefly in the form of free gold. All the ore went directly to the stamp mills, of which there were two. The older and larger mill contained sixteen batteries of five stamps each, with one Frue vanner to each battery. The new mill had eight batteries of five stamps, and two Frues to each battery. The large mill was driven by Leffel turbine wheels, with a pressure of 80 feet, and a consumption of 600 miner's inches of water. The smaller mill was driven by "hurdy-gurdy" wheels with a pressure of about 550 feet, and a consumption of 150 inches of water.

At both mills the tailings from the stamps passed over about 20 feet of plates on their way to the Frues. In each set of plates the first or upper one was copper; the rest were so-called silver plates.

The bullion from the stamps was 800 fine in gold and 200 in silver.

The concentrates from the Frues averaged from 1½% to 1½% of the ore stamped. They very rarely exceeded 2%. I was unable to get the exact assay value of the concentrates, but it was said to vary between $100 and $200 per ton.

The concentrates were treated at the chlorination works at the rate of 100 tons per month. The capacity of the works was sometimes greater than this, but as the supply of concentrates was limited, it was not deemed advisable to work them up any faster.

Care was taken to keep the concentrates always damp until they were put into the roasting furnace. If this were not done, a decomposition of the pyrites would have begun, forming lumps which would not roast, and which consequently would have caused a loss of gold in the residues from leaching.

A Fortschaufelungsofen was used for roasting. Its dimensions, including firebox, were 12x80 feet. The hearth was one continuous plane, but the charges, of which there were three in the furnace at one time, were kept entirely separate. The furnace men called the three compartments the "drying," the "burning," and the "cooking" compartments. In the middle, or "burning" compartment, the ore was spread out very thin, and occupied about double the space of either of the other compartments.

The furnace was worked by eight-hour shifts, one man on each shift, and one charge was drawn and a new one added in each shift. The charges weighed 2400 pounds, and carried about 10% of moisture. The ore averaged 20% in sulphur, and just before the

Dump, Showing Crew and Method of Handling Material, New Western M. & R. Co., Plymouth, Cal.

sulphur ceased flaming (in the second division of the furnace) eighteen pounds, or ¾%, of salt was added to the charge.

The roasted ore from one shift was kept by itself on the cooling floor until a tankful (about four tons) had accumulated from a single man's shift; then that lot was worked by itself. This enabled the person in charge the better to control the roasting, for, if only one lot out of the three was bad it was presumable that the fault was with the workmen; but if all three were bad, the probabilities were that there had been a material change in the character of the ore, and the roasting process must be altered accordingly.

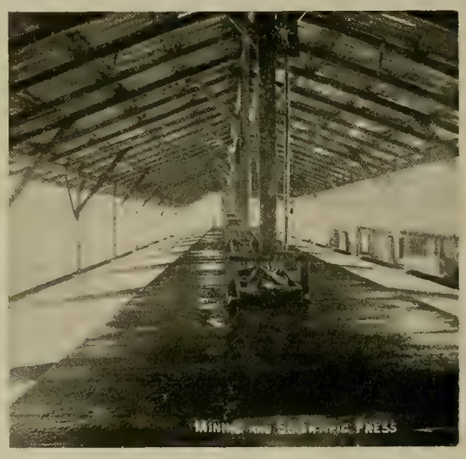
The vats for chloridizing the roasted ore were 9 feet in diameter by 3 feet in height, and were four in number. They were slightly inclined, so that they drained completely. The bottom of each tank was occupied by a filter about 6 inches thick, composed as follows: Light strips of ¾-inch wood were first laid in the bottom of the tank at intervals of about 1 foot. Across these strips were laid 6-inch boards, leaving cracks of an inch or more between the boards. On top of this loose floor were placed loose lumps of quartz, and on top of this again finer quartz material, until a total depth of about 5 or 6 inches was obtained. Finally this "sand filter" was covered by another loose floor, the boards lying crosswise to the loose floor beneath, and pretty close together. The upper floor was intended merely to furnish a shoveling furnace, so as to permit the removal of the leached ore from the tanks without disturbing the filter.

The ore to be chloridized must be damp (about 6% moisture). The working test was, to take a handful

Reduction Plant, New Western M. & R. Co., Plymouth, Cal. (Old Empire Mill Site.)

of the ore and squeeze it, then open the hand, and if the lump immediately begins to crumble and fall apart (not run) the ore has the requisite amount of moisture.

The damp ore was screened into the tanks, so that it would lie as loosely as possible, and facilitate the penetration of the chlorine gas. A coarse screen of ½-inch mesh was used for this purpose.



The tanks were filled up to within about 3 inches of the top. This was to insure that the entire contents of the tank would be covered by water in the subsequent leaching, otherwise there would be great difficulty in washing out all the soluble gold.

As soon as the tanks were filled as stated, they were ready for the introduction of the chlorine gas. This was introduced into the bottom of the tank from two opposite sides, and was continued until ammonia held over the ore gave off dense fumes of ammonium chloride. This usually took about four hours. When this point was reached, covers were placed on the tank and the cracks were luted with a mixture of leached ore, bran and water. The gas generators, of which there were two employed at one time in charging a tank, were allowed to work on until they were exhausted; then they were disconnected and the holes in the tank plugged.

The tank was usually charged with gas in the morning, and was left standing for two days. On the third day the ore was leached. The tank was first filled with water, and allowed to stand a few minutes, so that the water could penetrate all the ore. If no more water was absorbed, the liquor was first drawn off at the bottom, care being taken to keep the tank full of water during the entire operation, which took from four to five hours.

In charging the tank, a gunnysack was laid on top of the ore, where the wash water was afterward to be introduced, in order to better distribute the water in the tank and prevent its washing and packing the ore.

The liquor from the leaching vats was conducted to settling or storage tanks, and about forty pounds of sulphuric acid (66° B.) was added. Experience had shown this addition of acid to be advantageous in obtaining a clean product in the subsequent precipitation. The chemical reaction was, however, by no means clear. (To this statement an exception must be taken, as sulphurets sometimes contain considerable lead, almost always more or less. By adding

End View of Canvas Plant Interior, New Western M. & R. Co., Plymouth, Cal.

sulphuric acid, the lead is precipitated as sulphate, and the liquor, freed from lead, can yield no plumbic sulphate with the gold when precipitated by sulphate of iron, as it otherwise would; hence a cleaner bullion. In one chlorination works, if not more, the sulphate of lead obtained from the settling or "base" tanks, always containing some gold, is collected and sold, and a considerable sum realized for both the lead and gold.) It was usually allowed to stand for twenty-four hours, but two hours were quite sufficient. It was then run into precipitating tanks, and the gold was precipitated by a solution of sulphate of iron. The iron solution was added until, after stirring, a further addition produced no purple color. After the gold was precipitated, it was allowed to stand two or, if convenient, three days to settle; then the supernatant liquor was drawn off with siphons into a second settling tank, where any gold that had been drawn off by the siphons had a second opportunity to settle. The liquor stood in this tank until it was necessary to run it off to make room for another charge. Very little gold was found in this tank, and it was therefore only cleaned out once during the year. In the meantime, fresh liquor had been run into the precipitating tanks upon the gold already precipitated there. In this way, the gold was allowed to accumulate until the semi-monthly cleanup. Except when it was necessary to have them open, the precipitating tanks were kept covered and locked.

In making the cleanup the supernatant liquor was siphoned off, the gold gathered up and placed in a filter of punched iron, lined with a sheet of ordinary filter paper, and washed with water until all the acid and iron salts were removed. It was then dried, melted in crucibles, and cast into bars.

The works extracted from 95% to 96% of the assay value of the concentrated sulphides. Two men, on day shift, attended to all the work of handling the ore after it was washed (the leaching, etc.). The head man received $3, the other $2.50 per day. Owing

to the limited amount of ore allotted to the works, only three tankfuls were leached every four days. The men, however, were employed steadily. The sulphate of iron was manufactured on the spot. For this purpose an ordinary wooden tank about 4 feet by 4½ feet, standing outside the building in the open air, was used. The tank was kept full of water and supplied with old scrap iron ad libitum, and for each charge to be precipitated about forty pounds of acid was added to the tank.

The precipitating tanks, which were of wood, were protected from the action of the acids by a coating of "paraffine paint."

I append an itemized statement of the cost of handling the ore. The basis of figuring is 100 tons of ore per month of thirty days. Consumption of chemicals in the leaching department, twenty-four days each month:

Roasting—		
Three men at $2.50 per day for 30 days	$225 00	
1¼ cords wood at $4.25 per day for 30 days	223 13	
54 pounds salt at ¾ cent per day for 30 days	12 15	
		$460 28
Generator—		
The charge is manganese 30 pounds, salt 34 pounds, sulphuric acid 60 pounds; therefore, for two generators:		
Manganese, 60 pounds per day, 24 days, at $47 per ton	$33 84	
Salt, 68 pounds per day, 24 days, at $15 per ton	12 24	
Acid, 120 pounds per day, 24 days, at $60 per ton	86 40	
		132 48
Acid for settling tanks (40 pounds), and for sulphate of iron manufacture (40 pounds), 24 days		57 60
Wages of leachers, at $5.50, for 30 days		165 00
Salary of foreman		125 00
Total		$940 36

Or, per ton of concentrates, $9.40⅗.

To this price per ton should be added for assaying, repairing, supplies, insurance, taxes, water, interest on capital invested, deterioration of plant, and proportion of general expenses and superintendence, about $4 additional per ton, making the total cost of working $13.40.

Altitude (aneroid reading)	1,050 feet.
Length of ore shoot	800 feet.
Length of south shaft on incline	1,280 feet.
Depth of ore shaft vertically	1,100 feet.
Vertical depth reached in mine	1,600 feet.
Vertical depth of north shaft	1,020 feet.
Quantity of water raised in 24 hours)	18,000 gallons.
Character of hanging wall	Black slate.
Character of foot wall	Black slate.
Kind of powder used	Safety nitro, No. 2.
Cost of mining per ton (total mining and milling, $3 07)	$2 34
Cost per foot of shaft (labor and powder)	$18 00
Number of feet timbered	All.
Kind of timber	Round pine.
Cost of timber	$2 to $3 per log.
Length of ditch built	160 miles.
Cost of transport of ore	Nothing.
Number of stamps	160
Weight of stamps	80— 750 lbs. each. 80—1,000 lbs. each.
Drop of stamps	5 to 6 inches.
Drops per minute	90
Duty of stamps (tons in 24 hours	2
Kind of shoes and dies	Iron.
Size and character of screens	Round punched, corresponding to No. 8.
Kind of feeder	Tullock's and Hendy's.
Kind of concentrators	Frue's.
Character of ore	Soft quartz and slate, free milling and concentrating.
Percentage of sulphurets	1½
Value of sulphurets per ton	$125 to $200
Cost of milling per ton	$0 39
Cost per ton of working sulphurets (already embodied in cost total)	$11 33*
Percentage of value extracted from sulphurets	92 to 95
Kind of roasting furnace	Reverberatory.
Head of water used for power	561 to 550 feet.

* To this cost must be added its proportion of incidental expenses.

Recently the New Western Mining & Reduction Co. was organized and the Plymouth Consolidated dumps—vast piles of slate and quartz hoisted from the Pacific and Empire mines, Plymouth, Amador Co., during their palmy days and comprising over 250,000 tons—are now being worked over for the values on a large scale with equally interesting results.

The reduction plant consists of four 5-foot Huntington mills with classifiers, Wilfley and Woodbury concentrators, and extensive canvas plant, all operated by water taken from the Hayward ditch and pipe line under a head of 572 feet.

The dumps are attacked at their base with a double track and switch, running in sufficiently to square the face, when a temporary chute is placed, allowing greater portion to drop to car, though of course varying according to height and solidity of portion worked.

The material is then trammed a distance of 250 feet to an hydraulic elevator which lifts the car and cage, a total weight of 3100 pounds, a distance of 32 feet to bins where load is dumped onto inclined grizzlies, the bars set at 1¼ inches, the rejected portion passing onto an 8x12 Dodge rock breaker below, jaws of which are also set at 1¼ inches, the whole arrangement so designed as to give a fine first product to mills, thus relieving them of considerable duty and increasing capacity.

From the bins the product is automatically fed by four Challenge ore feeders to the Huntington mills, running at sixty-five revolutions per minute and employing a surplus of water with coarse screens, the object being direct concentration, so that sliming and unnecessary crushing is avoided.

Slot screens from 12 to 20-mesh (Nos. 1, 3, 5) are used, varying with character of dump encountered, using the coarsest on the low grade slate and gouge; these screens last on an average twelve days.

From each mill the pulp flows to a hydraulic classifier set directly under discharge and delivering two grades of material, the coarse product going to the concentrating tables, while all fines from overflow lead to a tailings wheel, 16 feet in diameter, where a lift of 14 feet is made onto the canvas plant, running parallel with main building.

The classifiers are of a well-known type, having a fixed pipe and T at bottom with a constant upward flow of clear water through which the coarser and heavier particles of pulp drop, while the fines go to an overflow. Each classifier has a centerboard, breaking the flow and giving a downward current, while the fixed head of water to each permits of separate regulation.

One Woodbury and two Wilfley concentrators receive and handle the coarse product from classifiers, this pattern of shaking table being well adapted for such material, giving a clean product with slight loss and requiring little adjustment or repairs.

The canvas plant building, 156 feet long and 20 feet wide, consists of twenty-four inclined tables each 12 feet wide and 7 feet long, with a grade of 1½ inches to the foot. A walk-away the full length of center of building gives a clear observing and working space, from which the tables are periodically washed by a hose with a flat spray. The washings delivered onto a Wilfley concentrator are then cleaned to a high grade shipping product.

The capacity of the four mills in twenty-four hours is 125 tons; of this the concentrators handle eighty tons, the balance going to the canvas plant.

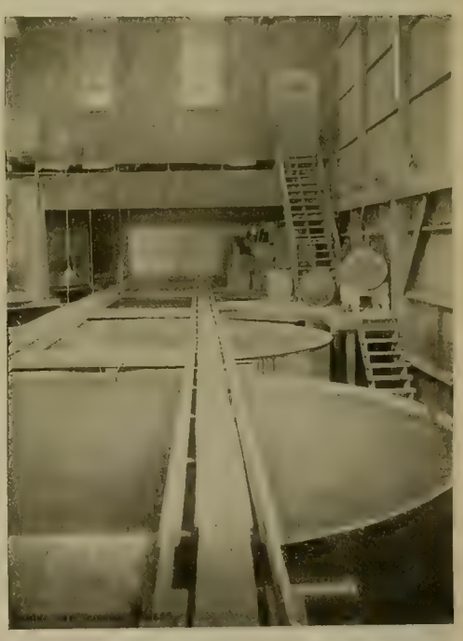
One head mill man with helper attend to each twelve-hour shift, the entire stoppage for oiling and repairs for twenty-four hours being thirty minutes.

One man on twelve-hour shift attends canvas plant, making a round of washing tables every hour.

The principal values in the dump are contained in the sulphurets, averaging 1¾%. All free gold present is caught with the concentrates, which are shipped to the Selby Smelting Works, Vallejo Junction, Cal., in carload lots for treatment.

During the last six months the average cost of working the dumps has been as follows:

THIRTY DAYS MILLING 3750 TONS.



Dump work, delivering to mill	$ 375 00
Milling, including canvas plant	510 00
Water	240 00
General expense	110 00
Total	$1235 00
Total cost per ton	32 cents.

The above cost per ton is believed to be as low a figure as any at which any gold-bearing material has been treated in quantities. In several instances Supt. T. C. Woodworth has personally superintended the erection and operation of plants on tailings and dumps, both cyaniding and concentrating, much of the practical idea of erection and subsequent treatment of the dumps by the present plant originating with him. To the president of the company, F. J. Moffitt of Oakland, Cal., is due much of the credit of organization and carrying on the business.

A Great Mining Area.

Written by CLARENCE KING.

The mountain system that borders the Pacific from Cape Horn to the Arctic sea covers an arc of nearly half of the great circle of the globe, and has its widest expansion about the latitude of San Francisco, where it is 1200 or 1400 miles wide. That mountain system ranks next in physical importance to that of the east and west system which traverses Asia and Europe, but unlike that system it is an empire of mines, and its geology, besides having a high abstract interest, lies at the basis of the knowledge of minerals for this immense area. The quantities involved in this system of the Cordilleras are great almost beyond belief. They involve the superposition of strata amounting to over 120,000 feet in actual measured thickness; they involve a history from very near the dawn of geological history, absolutely until to-day of enormous dynamic action and effect. And this dynamic action has consisted in the upheaval, in the depression, in the crushingand folding together, and in the dislocation of enormous blocks of this great territory. The sedimentary series, which have been said to amount to over 100,000 feet, are derived from the older rocks in their immediate neighborhood. So far as we have been able to see, these sediments have never traveled to very great distances. Sometimes a series of strata, amounting in all to 40,000 feet, have been piled up consecutively and continuously and without break; but all these series of various episodes of sedimentation have ended in the destructive dynamic period, and they have been crushed, uplifted or depressed, and then the process of sedimentation has begun under new terms. These dynamic events which punctuate, as it were, the history of these Cordilleras, are due undoubtedly to the unbalancing of the forces of gravitation and equilibrium. It is very well known to geologists that if you load any area with a heavy mass of sediment that area subsides; that if you unload any area, that area will rise. Consequently, whenever an area rises near an area which is stable or is sinking, there is a dynamic strain, and if that strain passes cohesion, passes the point of the elastic limit of the rocks, or the cohesive limit, they are eruptured by these tremendous strains, and the action usually ends in the eruption and readjustment of equilibrium and eruption of melted matter from the subjacent area. It is in these periods of stress and strain to which the rocks and whole distances, and enormous areas and ranges and whole mountain ranges have been subjected that the crushing, straining and fracturing and fissuring takes place, which is the birth of a mining district. I do not mean to indicate that every crushed area, or every fissure or block of country is the birthplace of a mining district, but because mineral veins owe their origin to two processes: one is the fissuring of the rocks, or the solution of soluble rocks on lines of fissure, and the second process is the deposition of mineral matter on, in, along and near these fissures. So that a mining district requires the two periods of action; I mean a block of country requires the two classes and periods of action to bring it from an amorphous mountain pass into a mineral district. These periods of crushing have never occupied a very great part of the geological history; they are sudden, con-

Leaching Tanks in the Albemarle Mill, Near Bland, New Mexico: Stairs Lead to Precipitating Room.

Crushing and Drying Room, Albemarle Mine of Cochiti G. M. Co., Near Bland, New Mexico. (See page 584.)

vulsive episodes which follow periods of accumulation of strata, periods of upheaval and periods of depression; but, short as they are, they have ended in deluging enormous tracts of this Cordilleras system with eruptive rocks, molten when they came out, and which have cooled under or upon the surface. There are fields of these eruptive rocks which cover many thousands of square miles; there are other fields which are extremely small. And as I say, these periods began in the earliest geological ages, and have gone on practically to the present.

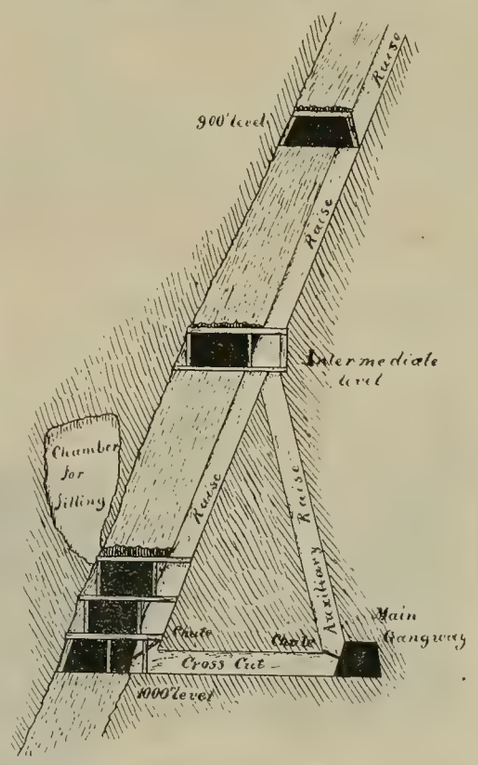
The study of these rocks which have been erupted in these various periods has resulted in a fine classification as to species, and in a certain measure as to origin and also to a rougher classification in time; that is to say, rocks which we know to be earlier than the dawn of life, which we will put at the base of the Cambrian, are of a different class from those which are erupting now from present volcanoes. They have shades of difference in texture and in composition, and in the relative proportion of their different elements, but chiefly their distinction is one in decompositions; that is to say, it is very rarely we get from the earliest periods any form of lava which is as fresh and as new as these which are being erupted now. They have undergone chemical decomposition more or less. So that in a general rough sort of way the ocular examination of a district of erupted rocks usually gives rise to a fairish judgment of about when that district was built.

Mining on the California Gold Belt.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS, Assistant State Examiner of Mines.

That portion of the gold belt of California known as the mother lode has furnished a field of geological study ever since its discovery. Many geologists have given it their attention and a great deal has been published concerning it that is valuable. Among the most valuable contributions to our knowledge of this mineral belt are the writings of Dr. Rossiter W. Raymond and Ross E. Browne, and later those of H. W. Fairbanks, Ross Browne, and, more recently, the exhaustive reports and maps of the United States Geological Survey. The various reports of the State Mining Bureau have also furnished a large amount of valuable technical and statistical information on this subject. In view of the vast amount of information heretofore published concerning the geology and mines of the mother lode, it was with the feeling that the subject was worn somewhat threadbare that the writer undertook the reinvestigation of this important field.

Since the publication of the thirteenth report of the State Mineralogist in 1896 no publication has been issued by the State regarding the progress of work in the counties along the mother lode, though this period has been one of marked progress, and also of innovation, in these mines. Old methods have given place to more modern ideas, and still more radical changes may be looked for in the future. An era of deep mining has commenced which can only be successfully carried on by the adoption of modern mining methods and improved machinery and closer attention to the treatment of the ores. Already mines which in former years were worked in a more or less primitive manner, under many disadvantages and at an expense considerably above that now necessary to accomplish given results, after being long abandoned have been reopened and are again profitable. This has been made possible by the reduced cost of labor in later years; by the superiority of nitro powders over the black powder formerly employed in all mining operations in this State; by cheaper and better mining supplies generally, and, in the best equipped mines, in no small degree by the improved modern hoisting machinery and mining methods.



The marked mechanical success attending very deep mining elsewhere, notably in the Lake Superior copper mines and in South Africa, has undoubtedly been a great incentive to the miners of California to emulate these efforts, and we find vertical shafts being sunk to a great depth, far below anything heretofore attempted in California mines.

There are mines in Amador and Nevada counties operating to a depth of 2500 feet through old inclined shafts, usually sunk to conform approximately to the changing incline or dip of the veins, and there are numerous veins having inclined shafts in several counties which penetrate to a depth ranging from 1500 to 2000 feet; but the managers of these properties realize the importance of having shafts sunk at a uniform angle, either vertical or inclined, thoroughly equipped and provided with the best hoisting machinery in order to reduce the cost of mining, for in nearly all the larger mines it is known that there are immense bodies of ore which are too low grade to pay by the old methods of mining, but which, with modern equipment and methods, would yield large profits to owners.

A policy which obtains almost universally throughout California mining districts is that of demanding immediate returns from development. While this, of course, is very desirable, it often ultimately works to great disadvantage to the owner, and the manager is so seriously handicapped that he is unable to make substantial headway. In some mining regions this condition of affairs is not a great drawback to the success of operating the property, but in the mines of the mother lode it is undoubtedly a short-sighted policy. The reason of this will become apparent when it is understood that with few exceptions the ground is heavy—often swelling—crushing the heavy timbers. The usual practice is to drive a crosscut or drift from a station at the shaft to the vein channel. This may or may not at once encounter ore; if not, a drift is driven along the fissure, which must be timbered in the most substantial manner. These drifts are usually not less than 7 feet high, 4 to 5 feet wide at the top and 7 to 8 feet at the bottom. These dimensions are all inside the timbers. It usually makes little difference whether the cutting is in ore or not, the ground is generally heavy. The fissures are often 10 to 40 feet wide and the miners—of Amador particularly—are well acquainted with the danger, difficulty and expense attending this kind of mining. As soon as pay rock is encountered it is hoisted and sent to the mill and the drift continues, while overhand stopes are started and development proceeds as in mines elsewhere. It may be several hundred feet to the limit of the property, and is often over 1000 feet, and this heavy swelling—sometimes running—ground must be kept open until the entire level has been explored and the ore all extracted and sent to the surface. An idea of the character of some of this ground may be gained from the statement that in certain instances a drift of usual size being driven a distance of 200 feet, at the rate of 5 or more feet daily, under contract, cannot be completed before it becomes necessary to return to that portion first driven for the purpose of retimbering. The timbers employed in holding ground of this character are usually 20 to 30 inches in diameter, and it is no uncommon thing to see these immense logs split, crushed and broken as though they were incapable of offering any resistance to this all but irresistible force.

The advisability of cutting the main gangways in the hard rock of the walls, either foot or hanging, and reaching the vein by a system of crosscuts is earnestly advised. This has not as yet been attempted, but its feasibility and desirability can readily be appreciated when the character of the main fissures, as above explained, is understood.

These main gangways, being driven in, say, the foot wall, should have crosscuts extending at right angles to the direction of the main gangway. These are disposed at stated intervals for the purpose of prospecting the fissure and to render accessible the ore discovered. Raises should always be put through, connecting with the level above, before stoping is commenced. Very often this is neglected, owing, as previously stated, to the haste to realize on

Method of Working Veins in Swelling Ground.

the ore as quickly as possible. When the raises are not put through, the heavy timbers must be hoisted up through the raise into the stopes by means of block and tackle at great expense of time. If the raise were through, the cost of handling these great timbers would be very materially reduced by lowering them through the raise from the level above.

With the lateral drifts and crosscuts completed and the drifts driven on the vein, with raises through to the next level above, the work of stoping can be carried on at as many points as may be desired, and the ore once out the level may be abandoned and in a few weeks, or months at most, the greater portion of the excavation made on the vein will collapse and be closed up forever. This works no harm or inconvenience, as the main lateral drift remains open.

When operating in this manner filling for the stopes may be taken from the hanging wall by driving an inclined raise into it and opening out a chamber. The rock broken in these chambers will pass by gravity down into the stopes beneath and fill them, little or no shoveling being necessary. This method of mining and filling, when properly carried out, will prove more safe and far less expensive than the methods heretofore employed in mines of the California gold belt. These filling chambers may be worked with hand or small power drills, as seems most advisable. One of the greatest items of mining expense, as now practiced, is that of constantly relieving swelling or running ground and retimbering. When the ore shoot is attacked in sections by crosscuts from the lateral drift, any particular section need remain open only a few months at most, instead of two, three or more years, as now. Another advantage may be derived by driving an intermediate level midway between the main levels, if the ground is particularly bad, and connecting with the crosscut beneath by a raise. In this manner the floor of the main level need only be maintained about half the time that would be necessary if all ore were sent down to the main level through mill hole extending upward 100 feet, more or less, and connecting two main leveis. This plan would of necessity require that a raise be cut through solid rock from the vicinity of the main gangway to the foot wall of the vein. Each of these raises would have an approximate height of 45 to 50 feet and would cost, perhaps, when timbered, $500; but the expense of keeping open the level in the vein would soon offset this expense if the ground were very bad. As a matter of course, the superintendent must determine when an intermediate level and auxiliary raise are justifiable. His experience with the ground in the fissure will indicate whether the plan suggested is advisable or not.

When putting through raises it is really an economical plan to sink a winze from the level above to meet the raise. By this means ventilation will be more quickly obtained and the additional work which men can accomplish will soon pay for the added cost of sinking the winze.

(TO BE CONTINUED.)

The Miner's Inch and Its Equivalent in Other Units.

Written for the MINING AND SCIENTIFIC PRESS.

One miner's inch corresponds to 1.5 cubic feet of water per minute. This is the legal allowance in Montana, and is fair average of the measurements actually used in California and other States where no exact value has been prescribed, and where the amounts sold by different water companies vary somewhat.

ONE MINER'S INCH IS EQUIVALENT TO—

	U. S. Gallons.	Imperial Gallons.	Cubic Feet Water.	Lbs. Water.	Tons Water.	Kilograms.
Per second.	$\frac{1}{5}$	$\frac{1}{6}$	$\frac{1}{10}$	1.56	0.0008	0.71
Per minute.	11.2	9.3	1.5	93.5	0.047	42.5
Per hour...	675	562	90	5620	2.8	2550
Per day of 24 hours..	16,200	13,488	2,160	134,880	67.5	61,180

HORSE POWER DEVELOPED FOR EACH 100 FEET OF FALL.

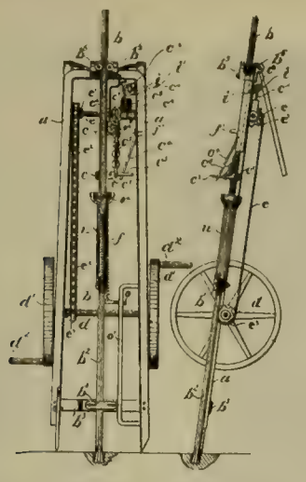
WATER UNIT.	Theoretical H. P. at 100% Efficiency.	Available H. P. at 90% Efficiency.	Available H. P. at 80% Efficiency.
By 1 miner's inch.....	0.3	0.26	0.24
By 1 cubic foot per min.....	0.19	0.17	0.15
By 1 pound per min.....	0.00303	0.0027	1.0024
By 1 U. S. ton per min.....	6.07	5.5	4.85
By 1 U. S. gallon per min....	0.025	0.021	0.02
By 1 Imperial gallon per min.	0.303	0.027	0.024
By 1 kilogram per min.....	0.0067	0.006	0.0053

To obtain 1 H. P. at 100 feet pressure requires 3.5 to 4 miner's inches; or, per minute, 6 cubic feet, 350 to 400 pounds, 40 to 50 U. S. gallons, or 30 to 40 Imperial gallons of water.

CONVERSION TABLE FOR WATER.

U. S. Gallons.		Imperial Gallons.		Cubic Feet.		Pounds.		Tons.		Kilograms.
1.	=	0.833	=	0.133	=	8.33	=	.....	=	3.77
1.2	=	1.	=	0.16	=	10.	=	.005	=	4.54
7.5	=	6.25	=	1.	=	62.5	=	$\frac{1}{32}$	=	28.4
0.12	=	0.1	=	0.016	=	1.	=	.0005	=	0.454
240.	=	200.	=	32.	=	2000.	=	1.	=	907.
0.264	=	0.22	=	0.035	=	2.2046	=	.0011	=	1.

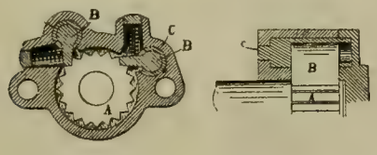
In the above table the U. S. gallon is taken as 8.333 pounds water, which is very approximately correct; on this basis 5 Imperial gallons = 6 U. S. gallons.



One U. S. gallon per minute = 6 tons water per day. One U. S. gallon per hour = $\frac{1}{16}$ ton per day.

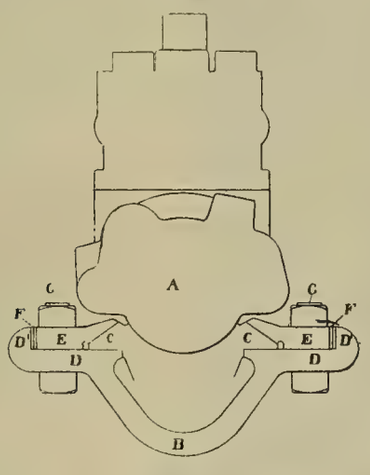
Mining and Metallurgical Patents.

Patents Issued May 15, 1900.



Specially Reported for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 649,464; E. Lawson, Brewer, Me.

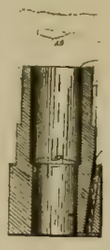


In a rock drill, frame, drill bar carrying drill and adapted to operate in frame, clutch adapted to operate drill bar, means for operating clutch consisting of shaft mounted in frame, drum adapted to revolve on or with shaft and having projection, arm or block secured to shaft and carrying pin adapted to work therein, adapted to engage projection on drum to revolve drum with shaft, and to be disengaged from projection to allow drum to revolve independently of shaft, and means for operating drum.

ROTARY ATTACHMENT FOR ROCK DRILL PISTONS.—No. 649,547; H. P. Reardon, San Francisco, Cal.

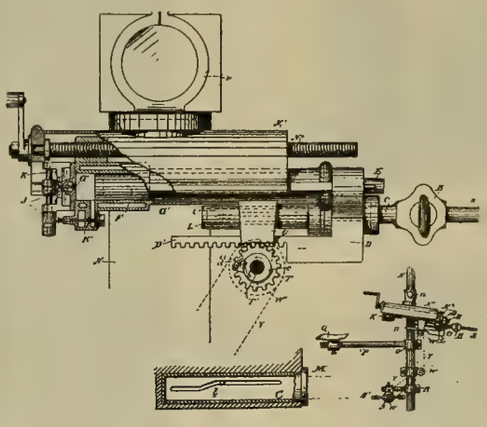
A removable slotted sleeve, located in ratchet chamber of drill, having ratchet pawl movably fitted therein sleeve extending beyond width of pawl and having its projecting ends socketed in walls of ratchet chamber and provided with means adapted to prevent axial movement thereof.

ADJUSTING DEVICE FOR ROCK SLIDES.—No. 649,548; P. H. Reardon, San Francisco, Cal.



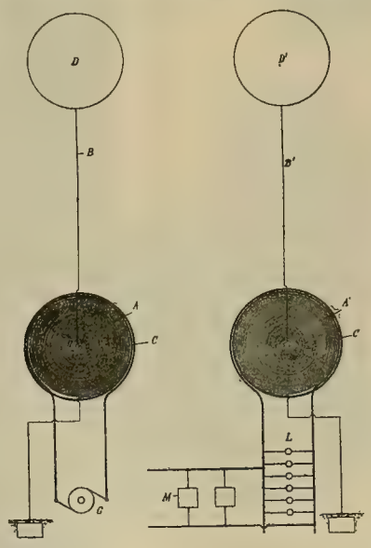
In a fluid actuated rock drill a cylinder, a frame to which cylinder is slidably attached and longitudinal slide and guide between cylinder and frame, provided with detachable gib with bolts or other suitable means for locking gib in place independent of cylinder and fixed longitudinal rib adapted to effect alignment of gib, and means adapted to follow up and maintain parallelism of gib comprising one or more independent parallel strips between gib and rib.

PROCESS OF MAKING LEAD CARBONATE.—No. 649,507; G. D. Coleman, Bridgewater, Mass.



Making pure lead carbonate consists in subjecting metallic lead in the presence of water to the oxidizing action of atmospheric air at a temperature of approximately 125° Fahrenheit, in subjecting product of last named step to action of carbonic acid at lower temperature, in subjecting product of last named step to oxidizing action of atmospheric air at a temperature of approximately 125° Fahrenheit, and in subjecting product of last named step to action of carbonic acid at a lower temperature, whereby all the metallic lead is converted into lead carbonate.

DRILL BIT.—No. 649,488; F. Schrader, St. Louis, Mo.

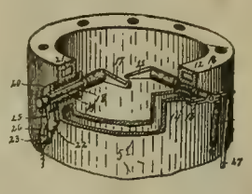


A drill bit comprising hollow cylindrical head, series of conduits formed therein and leading to center of surface of head, series of guide grooves formed in base of head and converging at delivery end of each conduit, shoulder formed in basal surface of head opposite guide grooves and adjacent discharge end of each conduit, upper end of each conduit having recess leading thereto for better guiding shot into conduit.

ROCK DRILL.—No. 649,602; E. M. Greene and W. Brady, San Francisco, Cal.

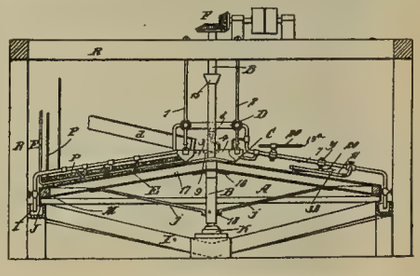
Combination in a rock drill of pair of cylinders with pistons reciprocating therein, connections between pistons and drill whereby they move in unison, inlet and exhaust valves and actuating mechanism by which cylinders are alternately charged and exhausted, and pistons impelled in same direction at each impulse, an independent motor, connections between motor and shaft having pinion loosely turnable therein, rack bar connected and movable with pistons and drill and engaging pinion, pawl and ratchet by which pinion is connected with shaft to return pistons after stroke, and pin by which pawl is disengaged to allow pinion to turn freely while pistons and rack are being advanced.

APPARATUS FOR TRANSMISSION OF ELECTRICAL ENERGY.—No. 649,621; N. Tesla, New York, N. Y.



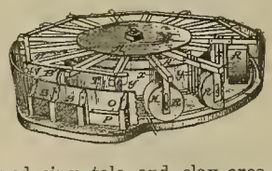
Combination with transmitting instrument comprising electrical transformer having its secondary connected to ground and to an elevated terminal respectively, and means for impressing electrica oscillations upon its primary, of receiving instrument comprising transformer having its primary similarly connected to ground and to an elevated terminal, and a translating device connected with its secondary, capacity and inductance of secondary of transmitting and primary of receiving intruments having such values as to secure synchronism with impessed oscillations.

EXTRACTION OF GOLD OR OTHER PRECIOUS METALS FROM SLIMES.—No. 649,628; W. A. Caldecott, Johannesburg, South African Republic.



A method of extracting precious metals from finely divided materials, such as slimes, containing reducing substances such as ferrous sulphide or hydrate, which consists in rendering the material alkaline, then forcing air into the pulp until the ferrous compounds are converted into ferric hydrate, then adding cyanide and continuing aeration and agitation until the precious metals are dissolved.

ELECTRICAL IGNITER FOR GAS ENGINES.—No. 649,778; D. M. Tuttle, Canastota, N. Y.

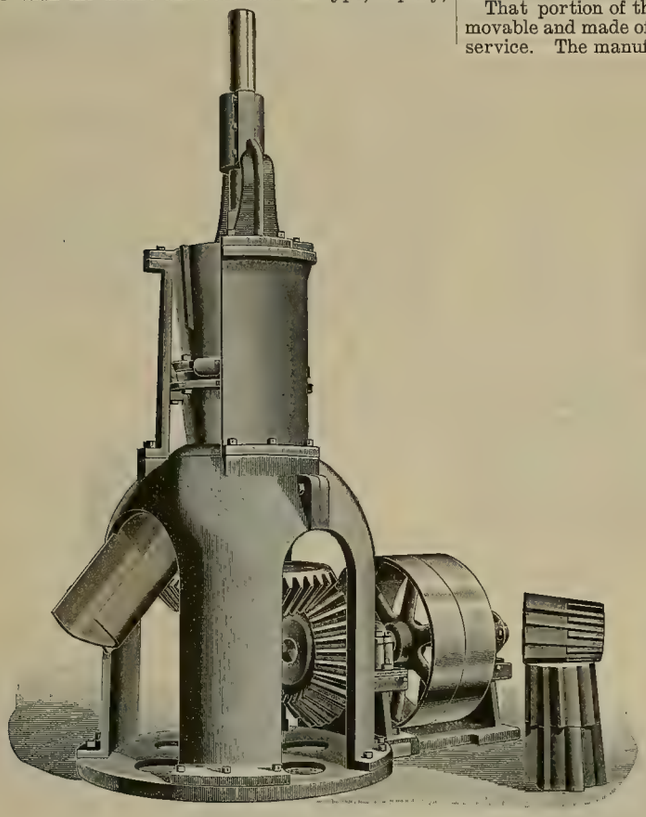


In a gas engine in combination with cylinder, a shaft 18, journaled in metallic bushing 19, insulated an insulating bushing 21, an integral terminal 17 on shaft, arranged at right angles thereto and within cylinder, an insulated arm 22, secured on outer end of metallic bushing by an insulated nut 20, carrying binding post 23, for attachment of line wires, rod 26 secured to out end of shaft to engage with binding post and limit return movement of terminal, spring 25 coiled on outer end of shaft between rod and nut having its lower end engaging with binding post; an uninsulated shaft 12, journaled in cylinder having terminal 11, extending at right angles therefrom adjacent to terminal 17, arm 13, secured to outer end of shaft 12, spring 15, secured to one end of arm, stop 14 engaging with other end of arm to limit movement of terminal 11, spiral spring 16 arranged on shaft 12, between arm 13 and outer surface of cylinder; a pitman 27 operated by eccentric 34 on shaft 1 of engine to engage with spring end of arm 13, to force terminals into contact and for a certain distance against action of return springs.

AMALGAMATOR.—No. 649,796; A. Z. Baldenebro, Mexico, Mexico.

Combination of rotary amalgamated table, stationary water pipe above it, clamp embracing pipe, shaft journaled in bearings rigidly connected with one clamp member, wedge projection located upon shaft and adapted to engage other clamp member, guide having universal joint connecting it with clamp, rod slidable in guide, branch pipe communicating with water pipe but movable relatively thereto, and supporting connection between rod and branch pipe.

PULVERIZING AND SEPARATING MACHINE.—No. 649,817; C. W. Day, Santa Cruz, Cal.



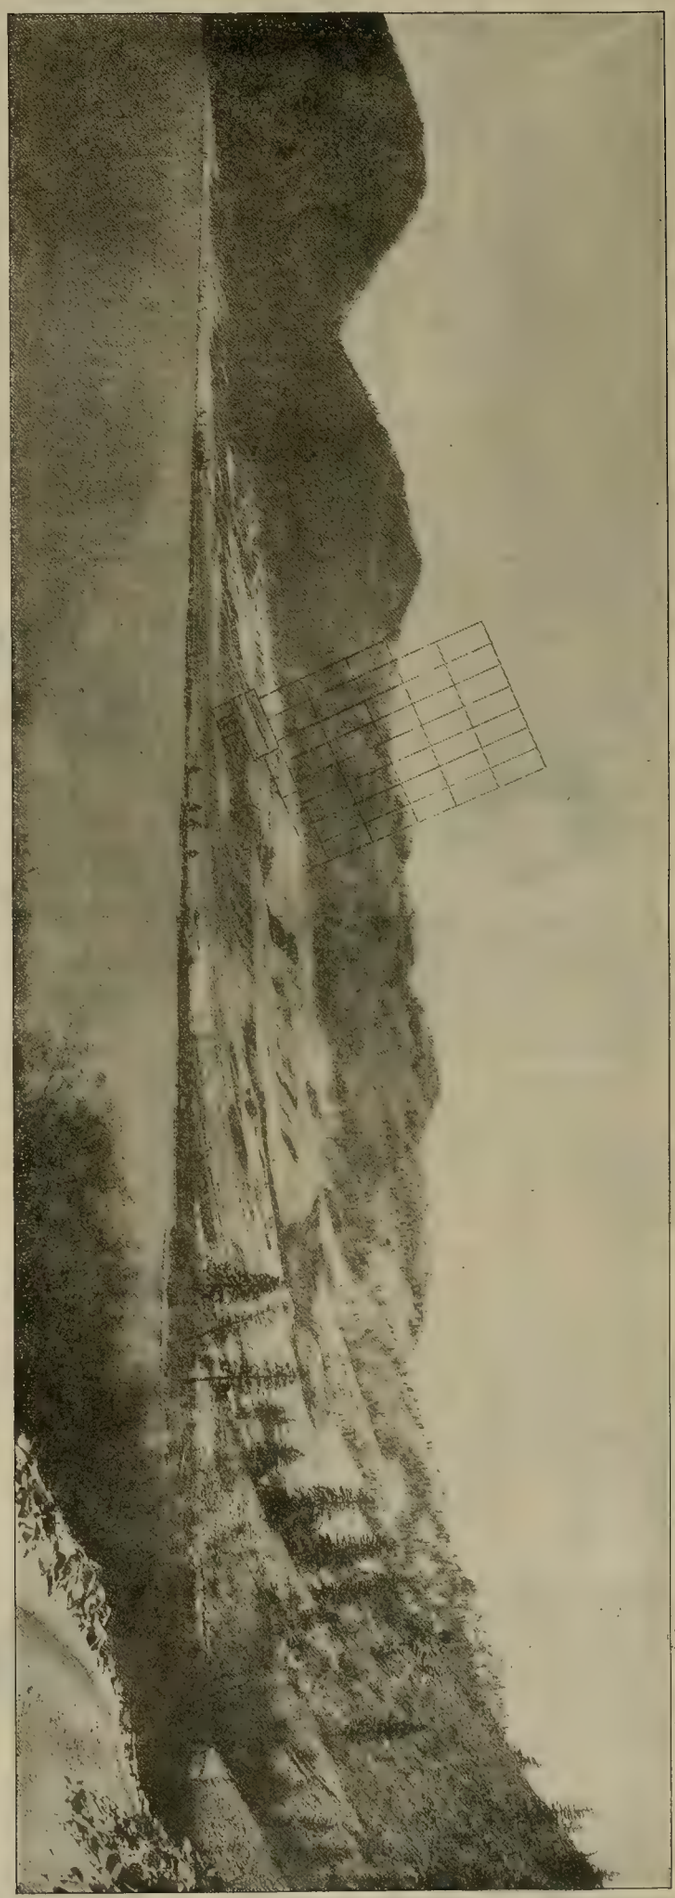
Mill for reducing talc and clay ores, comprising vertical post, or shaft, series of radiating arms, hangers pendent therefrom provided with vertical slots, rollers journaled in slots, arranged at different distances from post, series of scrapers and stirrers attached to and pendent from arms arranged in radial line with rollers, exteriorly or interiorly thereof, and scrapers and stirrers alternating on respective arms, and circular trough, having flat bottom with side grooves.

The Gouverneur Rotary Rock Crusher.

This crusher is intended to follow jaw crushers of the Blake type, reducing material much finer than the Blake and others of the type, rapidly, and without overstrain crushing down to, say, 2 inches in diameter.

The Gouverneur rotary taking material 2 inches in diameter will reduce to ⅜ inch and finer at a speed of from three to five tons per hour.

That portion of the machine subject to wear is removable and made of material calculated to give good service. The manufacturer makes no claim for novelty in principle, but offers, as a result of experience, a machine that after many trials is considered by him as one of the best of its kind, being self-contained and with strength where strength is required. In one form or another this machine has been for many years used in the crushing of talc rock which, on account of its fibrous nature, is considered hard to reduce.



The Gouverneur Rotary Rock Crusher.

Treatment of Copper Mattes in the Bessemer Converter.*

NUMBER III.

The pressure required in the upright converter is from 12 to 15 pounds, but in the trough or barrel converter from 3 to 10 pounds pressure suffices. We have made experiments lately with a direct pressure blower. The two vanes in this type of blower, of figure of eight shape, revolve in a shell. When applied to create high pressure, the vanes and shell must be thoroughly watercooled by water jacketing or by lubrication by water. The heat generated by high pressure otherwise melts the dope with which the vanes are coated. It was found quite possible with water lubrication to carry the pressure up to 12 pounds, and the horse-power consumed did not seem to be in excess of that of the blowing engine, but the water as a lubricant proved to be objectionable. Though all free moisture appeared to be condensed and the hot air when under pressure was apparently dry, as soon as the pressure was removed sensible moisture was liberated. This moisture did not effect the operation during the first half of the blow, when no metallic copper was found, but it seriously retarted the second. Long noses of chilled copper was formed, which protruded from the lining into the body of the converter, and reminded intact after the charge was poured. By thus reducing the effective size of the converter, these noses may have been the principal cause of the retardation. The experiment, though not conclusively satisfactory, encourages one to believe that this cheap, and cheaply installed, form of blower may supplant the costly blowing engine where the trough or barrel converter, which demands but a low blast, is used.

STEPS OF THE OPERATION.

Passing from the structural features of the plant to the steps of the operation by which matte is blown up into copper, and the metallurgical changes which result, they may be considered in the following order: 1. Lining the converter; 2. Charging the converter; 3. First blow; 4. Skimming; 5. Second blow with frequent punching; 6. Final skimming; 7. Pouring the metal; 8. Repairing the lining; 9. Disposal of slag.

As no practical method has been devised for adding silica to the charge, except through the medium of the lining, the constitution of the lining and the mode of building it into the shell, are matters of extreme importance. Attempts have been made to blow the silica into the charge through the tuyeres, and to satisfy the matte by throwing it as lumps into the converter mouth; but apart from mechanical difficulties attending these methods, the silica remains too short a time in conflict with the matte to permit of its combination with the oxidized iron, and therefore whether added in powder or in coarse particles, most of it is found floating unaltered in the slag. The violent agitation of the converter's contents, and the rapidity with which the reactions take place, and the large body of slag which is almost immediately formed and protects the matte, may explain the anomaly.

Though it is difficult to see why finely divided silica ascending through the charge should not be attacked in preference to silica embedded in the lining, nevertheless reports of experiments prove that the silica whose specific gravity is so much less than that of the matte, does in great measure escape unaltered, and that the lining is the only economical menstruum for its supply. The practice has generally been to make the lining as siliceous as possible, using a pure quartz or quartzite mixed with only clay sufficient to make a plastic mass capable of being hard-moulded into lumps, which are generally pounded, also by hand, into the converter. When the lining is not mechanically pressed into the converters, and the grade of the matte not above 50%, about one-half, often somewhat more, of the weight of lining is consumed to the weight of copper pigs made. At the Great Falls the lining is mechanically pounded into place by a steel tamper around a steel templet, which is expanded by a wedge while the lining is being inserted, and can be made to collapse sufficiently for extraction by the removal of the wedge after the lining is thoroughly set. The converter during the tamping rests on a revolving table. In this way the mass is more uniformly compacted, leakage of blast between the lining and the shell, or through the porous lining, is minimized, a larger amount of material is compressed into a given space, and the surface is smoother and less liable to abrasion than in the hand-made lining. As a result a single lining slags more than twice as many charges than when it is hand-laid, which is partly due, however, to its greater thickness. Usually with a 45% to 50% matte not more than four charges can be tapped to a lining, and between each charge more or less patching is done through the mouth of the converter. The patching can be more easily effected in the shallow trough or barrel converter than in the deep vertical shell. It has been found, however, that a much more basic lining can be used without retarding the final reduction to metal, and that the presence of copper is not detrimental.

The slags from siliceous lining run generally about 50% in FeO. As the lining eats away, the size of the charge increases. For instance, in a run of five charges to a lining of very aluminous gold ore in a trough converter, the production was:

1st	charge	11 bars.
2nd	"	12 "
3d	"	14 "
4th	"	15 "
5th	"	21 "

74 bars of about 250 lbs. each.

Another lining the same day lasted only for four charges, and gave:

1st	charge	8 bars.
2nd	"	12 "
3d	"	16 "
4th	"	21 "

57 bars of about 250 pounds.

In this experiment, on twenty-three tons of ore as lining, there were made fifty-five tons of copper. The matte was high. But if the lining be siliceous, and the mattes of from 45% to 50% Cu, the quantity of lining consumed is approximately one-half the copper produced. Hixon says with regard to the practice at Aguas Calientes, in the very large converter, already referred to:

"At Aguas Calientes the lining was made entirely of ore, and this contributed a great deal to the success of converting low-grade matte at that point. If quartz had been used instead of ore, the expense would have been too great to admit of 30% Cu matte being converted. It was very fortunate that an ore of such ideal composition for the purpose was to be had. This ore came from Pachuca, State of Hidalgo, and was mined there in large quantities."

As the lining becomes thin, the danger of cutting through the converter shell at some weak point becomes imminent. To avoid this we lay a single course of magnesia brick on the iron shell, then pound siliceous lining over it. The magnesia does not melt even when exposed at spots, where the silica lining happens to be quite corroded and in contact with it. The magnesia brick are, of course, drilled for the tuyeres, but through the soft clay linings the tuyeres are made by merely punching a hole the required size, generally ¾-inch. An iron tuyere penetrating the lining has been generally abandoned as needless.

*Condensed from a paper read by JAMES DOUGLAS before the London Institution Mining and Metallurgy.

Carr Commutator Truing Device.

The Akron, O., Electrical Mfg. Co. is producing a device for turning up the commutator of a generator without removing the armature from its bearing, built on the engine lathe principle and directly attachable to any machine having a removable bearing cap.

The T-shaped clamp (1) is bolted to the machine in place of the bearing cap; set screws (8) being provided in its lower end to rest against its pedestal and steady the tool. On this piece is clamped the tool bar (6), by means of a saddle, that allows the bar movement both perpendicular and parallel to the face of the commutator and which instantly clamps the two pieces by drawing the lever nut (4). The bar (6) carries the slide (10), which in turn carries the tool post (2); this slide is driven relative to the bar by means of screw and hand wheel so giving the feed. The adjustment of the tool at right angles to the face of the commutator is also accomplished by a hand wheel and screw operation on the saddle (7), it being first necessary to slacken the lever nut slightly. At the extreme outer end of the tool bar a threaded rod (3) is screwed in, and intended to be screwed down to a solid support, acting as a jack to steady the tool at the extreme limit of its cut. A center (5) is attached to the device by means of adjustable brackets, to prevent end motion in the commutator while being turned.

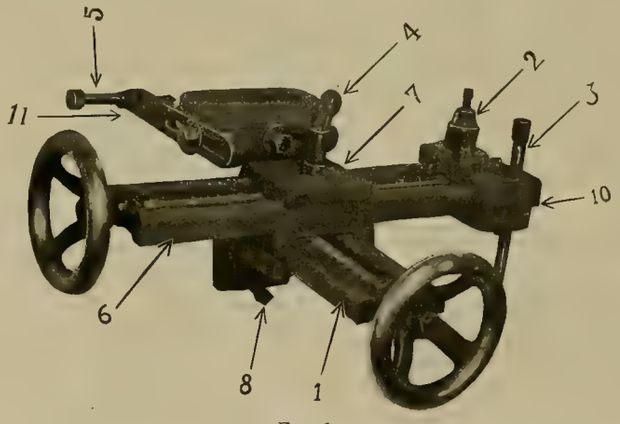

FIG. 1.

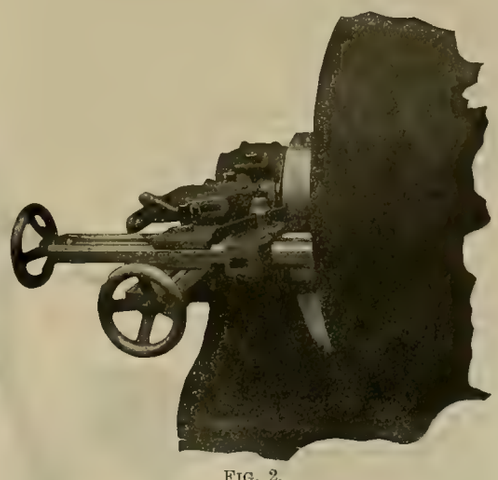

FIG. 2.

The general method of attaching the device to a generator is shown in Fig. 2.

For the best work a commutator speed of from 200 to 250 feet per minute is desirable, and in the case of large machines this can generally be obtained by slowing the source of power. A crank for attachment to the pulley is provided so the machine can be operated by hand if necessary, but it is desirable to use the power drive owing to its more uniform speed.

Some Current Comment From Our Readers.

NO LONGER A CURIOSITY.

We had until recently what we here considered a curiosity—a mining superintendent who didn't take nor read the MINING AND SCIENTIFIC PRESS; but of late he has taken to looking over its pages, and herewith I send you his name and $3 for one years' subscription.

Kingman, Ariz., May 3.

GETS A BIG THREE DOLLARS' WORTH.

I am amazed at the amount of valuable technical matter you weekly furnish. For $3 I get fifty-two treatises that would cost me in other form at least $100. I think you ought to get 50,000 subscribers.

Sonora, Mexico, May 5.

THE BEST OF ITS KIND.

Enclosed find $3 to continue my subscription for the MINING AND SCIENTIFIC PRESS. It's the best paper of its kind printed anywhere.

Saint Joe, Ark., May 1.

HAS A SUPERIOR INDIVIDUALITY.

Saw a copy of your issue of Jan. 7. I appreciate the practical articles on mining methods. Send the paper to following address for 1900 and also to our London office, addressed as enclosed. Your paper has a superior individuality to that of any other similar publication. Enclosed find draft for £1 13s. for both papers for 1900.

Adelaide, So. Australia, March 5.

PLEASED WITH THE PRACTICAL ARTICLES.

I am especially pleased with the great number of valuable practical original articles you publish. You weekly have more original matter than all your competitors combined that I ever see.

Seattle, Wash., May 6.

Age of the World.

Heinrich Schmidt, a German geologist of Jena, has figured out the various periods of millions of years, which convey no meaning to most minds, into parts corresponding to parts of a day. This gives him these results: The first age of the world, the Archaic or Eozoic, occupied the same period toward the whole age of the world as do 12 hours, 28 minutes and 48 seconds toward a day. The Paleozoic age was the equivalent of 8 hours, 9 minutes and 30 seconds. The Mesozoic age equaled 2 hours, 38 minutes and 36 seconds. The Quaternary equaled 2 to 3 minutes, and, finally, what we are accustomed to call the history of the world—the history of the last 6000 years—amounts to only 5 seconds.

Aging Timber by Electricity.

THE aging of timber, which formerly required long storage, is now completed by electricity in a few hours. In the Nodon-Bretonneau process the timber is piled on a lead frame in a large wooden vat, is nearly immersed in a chemical preparation, and is covered over by shallow vessels of water having porous bottoms of felt and linen. The positive pole of a dynamo is connected to the lead frame and the negative pole to the water vessels. On the passage of the current, the sap is driven to one side of the wood and expelled, and the chemical liquid enters the pores and takes its place. After drying, the wood is ready for use.—Electricity.

The Cyanide Process at Mercur, Utah.

In the issues of April 21, 28, and May 5 appeared a valuable technical article entitled "Some Observations on Practice of the Cyanide Process at Mercur, Utah," written for this paper by Wm. Magenau. Supplementary thereto is appended a detailed account of the process at the Golden Gate mill, Mercur, Utah, written by D. C. Jackling, another expert in cyaniding.

The Mercur ores in general cannot be characterized specifically with regard to their physical or chemical composition for the reason that they are made up of widely varying proportions of several distinct varieties of gold bearing material, viz., a very fine grained, minutely fractured and extremely tough hard quartz; a siliceous limestone, also highly fractured; a compact ferruginous clay, and small quantities of decomposed porphyry. These varieties of rock occur singly and mixed in all proportions. The values in the quartz and limestone lie largely in the numerous fracture seams; in the clays and porphyrys they are very uniformly disseminated throughout the mass, and this class of ore is usually of higher grade than the others. Locally, the ores are classified into three varieties, according to their mode of treatment:

First—"Oxydized ores," consisting of a mixture in which the calcareous and siliceous varieties predominate, and in which the proportion of clay and talc is insufficient to interfere with percolation. This class of ore contains only an insignificant quantity of compounds of base elements, showing only very small fractional percentages of mercury, as cinnabar and arsenic oxidized compounds.

Second—"Talcy ores," which are almost entirely clay and soft, decomposed porphyry. These ores, like the class above, are almost free from base element compounds, but impossible of percolation, for the reason that on contact with water they disintegrate and settle to an almost impervious mass.

Third—"Base ores," consisting of a mixture of the above classes, with the calcareous and talcose varieties predominating and containing large quantities of base metal sulphides. Arsenic is the chief of these, occurring as realgar, orpiment and mispickel, in quantities sometimes as high as 50%, but averaging not to exceed 2%. Realgar is by far the most plentiful of the arsenic-bearing minerals, fully three-quarters of the arsenic occurring in this way. Antimony is present as stibnite. Occasionally small quantities of galena occur. Considerable quantities of iron pyrites are frequently encountered in minute crystals. Mercury is invariably present, but in less quantities than in the oxidized ores. Various hydrous sulphates of iron are present, as well as oxidization products of arsenic, both simple and in combination with lime and magnesia. Some of the rarer elements, most notably tellurium, are also present—in traces only. The clays of this class of ore are invariably dark gray or black in color, due to a considerable quantity of carbon, frequently as much as 4%, and in these are sometimes found organic compounds, which decompose potassium cyanide very rapidly. Silver is very sparingly distributed in all classes of ore, rarely exceeding one ounce of silver to ten ounces of gold. No metallic gold is visible in any of the ores until after they have been roasted, when occasional minute irregular particles may be discovered under the microscope. All the clean, base minerals are invariably poorer in gold than the gangue with which they are associated. The clear crystals or realgar and orpiment carry none at all, or only traces, showing that the incased values of the base ore are not directly due to these base metal minerals. The gold in whatever ore found dissolves very rapidly and completely in solutions of potassium cyanide, indicating that it is very finely divided in whatever condition it occurs, and these various facts have led me to the conclusion that the gold in these ores is present in a finely divided amorphous, metallic state, having the black or brown color characteristic of the metal when in this condition and consequently being unrecognizable under the microscope in its naturally occurring state.

* * * *

The ores are roughly graded in the mine into the three classes above described, viz.: "Oxidized," "talcy," or, as it is called in at the works, "mixed," and "base," and these classes are kept separate until the furnaces are passed, when they are all mixed together to go to the leaching tanks.

In order to keep the three classes of ore separate, the crushing machinery is necessarily arranged in three series, and both the large storage bins divided into three compartments. The crushers are so arranged that two classes of ore can be taken through either of them, but the rolls are operated each series for one class only. The crushers are set so that everything passing through them will pass a 2-inch ring. From the coarsely crushed ore storage bin the ore is automatically fed to the driers, and by them discharged to the heads of Berthelet screens, the fines going direct to the elevators, which discharge them into their proper finished ore bin compartment. The coarse ore passes a set of large rolls, set with their faces about half an inch apart, to another inclined screen, where the fines are kept face to face. From the small rolls the ore passes to elevators and is elevated to revolving screens, the fines drop directly into the bin and the rejections are returned to the small rolls for further reduction. It is seldom necessary to operate the driers, as the ore as it comes from the mines, except at unusually wet seasons, can be rolled and screened to the proper fineness without previous drying. On this account belt conveyors have been provided above the driers to convey ore from the coarse ore bins to the rolls when it is not necessary to dry it. These also work entirely automatically. On account of using both inclined and revolving types of screens, it is not possible to get an absolutely uniform product, but it is intended to finish the oxidized ores so that they will pass a 3-mesh No. 16 wire cloth; the talcose or mixed to pass a 4-mesh No. 15 wire, and the base an 8-mesh No. 16 wire. About 90% of the pulp will pass those sizes, the remaining 10% or slightly coarser material having gone through the inclined screens, the mesh of which is necessarily coarser than the product desired, on account of the inclined position of the cloth.

From the finished ore bin, the oxidized ore is ready to go direct to the leaching tanks, the base and mixed classes going to the roasting and calcining furnaces. The four furnaces nearest the bins are automatically fed from it by means of an elevator discharging into a small hopper connected by a 6-inch standard pipe to each of the furnace automatic feeding hoppers. It is worthy of mention that all spouts in the mill are 6-inch or 8-inch standard black pipe, and that they serve the purpose admirably from the fact that they are dustless, seldom clog, and when worn on one side can be turned one-third way over, thus affording three new wearing surfaces for one spout, and avoiding the troublesome operation of frequent repairing. The other five furnaces are automatically fed by two belt conveyors, one conveyor supplying two furnaces, and the other, which is over 200 feet long, supplying the other three.

The base ores are roasted to a "dead" or "sweet" condition, or as nearly so as practicable, being finished at a bright red heat. The raw ores enter the furnace with about 2% to 5% sulphur and 1% to 2½% arsenic, have these constitutents reduced to about three-fourths of 1% and one-tenth of 1% respectively. The high sulphur contents remaining in the roasted ore is almost entirely due to calcium sulphate, the sulphur remaining as sulphides rarely exceeding one-tenth of 1%, and usually being lower. The arsenic sulphides, realgar and orpiment, begin to volatilize with only partial decomposition, causing dense orange colored vapors to arize, before the ore reaches the first fireboxes in its travel through the furnace, and by the time it reaches a dull red heat 90% of these minerals have been discharged; but the most difficult part of the roasting operation follows in completely oxidizing the pyrites and arseno-pyrites. This difficulty is partially due to the fact that a high heat is not permissible on account of the presence of from 5% to 10% of lime in the ore, producing a mixture which sinters easily and is consequently ruined. It is worthy of note that in most careful investigation and checking of results on the roasting of over 100,000 tons of this arsenical ore, no appreciable gold losses could be detected that were traceable to other causes than ordinary dust losses, which were only a small fraction of a per cent.

The talcose ores are calcined, not so much for the purpose of ridding them of any deleterious compounds, as to change their physical characteristics, although the small amount of arsenic present in them as arsenous acid and its compounds is slightly reduced. The sulphur contents, all of which are present as sulphates of the alkaline earths, is not affected. The primary reason for the calcination of this ore is to dehydrate the clay and talc, and deprive them of their properties of plasticity, thus rendering them amenable to percolation, and this is very effectively done. The effect on the clayey ore is much the same as that of burning a brick clay, and the particles of ore which when raw would immediately disintegrate on contact with water, are after calcination unaffected by it. The ore is at the same time rendered extremely porous and permeable by solution, and is thus transformed from an impossible leaching ore to an ideal one. Both styles of furnace in use have been used as roasters and as calciners.

(TO BE CONTINUED).

Filing an Adverse Claim.

TO THE EDITOR:—I noticed week before last in "Concentrates" that in order to file an adverse claim in the U. S. Land Office a survey must be made by a U. S. Deputy Surveyor and a map filed showing the conflict.

On the 19th of January, 1900, the Ursa Major Supply Co., filed its application for a patent to the Big Hill Consolidated placer mine, containing 300 acres by legal subdivisions, and the sixty days publication was up March 23. On the 17th of March, Jas. Hill filed an adverse claim in the Land Office at Sacramento, which was accepted, stating that he claimed 1320 feet square, but not by legal subdivisions, of the ground applied for. He did not have it surveyed, nor did he file any kind of map, showing what part of the ground he claimed, but yet the Register and Receiver accepted it and ordered it tried in the Superior Court of Placer county, and the case comes up for trial on the 23d of this month.

I am superintendent of the Big Hill Con. mine and am acting as attorney in fact for the Ursa Major Supply Co., and it seems to me that this case would interest miners all over the country who contemplate ever getting a patent, and I hope you will inform us through "Concentrates" under what law the officials at Sacramento were acting when they accepted it and compelled the U. S. M. Co. to go to the expense of a suit over the property.

Iowa Hill, Cal., May 15. E. M. ARMSTRONG.

The "Concentrate" referred to was an exact statement of general fact. The conditions recited above can not receive exact answer, as this paper is not acquainted with all the facts in the case. It may, however, be said that an adverse placer claim under the circumstances set forth by Mr. Armstrong should be supported by a proper survey. If the local land offices have erred in its reception an appeal should be taken. The local land offices have not the right to order an adverse claim suit to be brought in any particular court. If they do so their action may be treated as a nullity.

New Era Electric Drill.

The New Era Electric Rock Drill Co. of Denver, Colo., are manufacturing an electric rock drill, designed by M. C. Jackson, which is shown in the accompanying illustration. The description given herewith will be of interest to our readers. The electric motor which drives the drill is encased in a small, compact box, dust and moisture proof, and may be operated by currents from an electric power station, a steam or gasoline engine or a water wheel. Motor and drill are connected by a flexible shaft, a small starter at the rear end of the drill being provided, which gives the operator instant control in starting and stopping. The flexible shaft imparts motion to beveled gearing at the end of the driving axle of the drill; and on the opposite side of this axle is a gear which drives the flywheel, the latter being so geared that when the driving axle is run at 600 revolutions per minute the flywheel makes 900, greatly increasing the efficiency of the latter. The driving axle passes through the crosshead of the drill, the rear end of the crosshead containing a peculiarly shaped slot, so contrived that a one-fourth forward movement of the axle crank gives the full forward striking blow. Thus the momentum given the piston, with the drill running at 600 revolutions, is equal to the momentum of a crank running at 1800 revolutions. The rear end of the piston passes through the forward end of the crosshead, making a loose fit. Two buffet springs give the piston recoiling power, one of them being located on the inside of the front end of the crosshead and the other fitting snugly against its outer front end. By means of these springs the piston is prevented from striking a rigid blow. It must not be understood, however, that these springs are a factor in giving power to the stroke, as the power of the blow is derived entirely from momentum. Another feature is the rotation of the drill bit. Two rabbeted cases contain the pawls; one case rotates the piston on its backward movement and the other holds the piston when rotated and imparts to the latter a direct, straight blow, never permitting the bit to strike the rock a glancing blow. The steel is held in chuck by a novel one-nut clamp. The main clamp of the drill is held by one bolt, and by loosening one nut the drill is placed on a perfect swivel. A feature of the clamp is its side motion, by which, when a hole is started, the clamp proper need not be loosened till the hole is finished, as the side movement for changing bits is readily made. The machine is simple in construction, strikes a blow equal to about 200 pounds, delivering from 500 to 700 blows per minute. The power required is a 1 to 2 H. P. motor to each machine.

New Era Electric Drill.

MINING SUMMARY.

ARIZONA.

COCHISE COUNTY.

A recent discovery of ore near Charleston may bring that long dead camp into prominence. The Pittsburg-Arizona G. & C. Co. has developed a group of claims near the one-time prosperous smelting town, the Porto Rico, San Juan, Manila, Resurrection, Giant, Santiago and Havana running rich in gold, silver and lead.

COCONINO COUNTY.

At the Anita mines ninety men are employed under the supervision of Supt. McAdams.

The railroad from Williams to the Grand canyon has been completed a distance of 40 miles and promises to open up a large and rich mineral district.

PINAL COUNTY.

General Manager Blair of the Mammoth mine says his company has just completed an addition of twenty stamps to its 50-stamp mill, and is now completing contracts for the installation of an electric plant that will cost $150,000.

SANTA CRUZ COUNTY.

Oasis: In prosecuting work upon the Mowry mine, in the Patagonia mountains, between Harshaw and Washington Camp, the present owners have in several instances found good ore in the old workings which had been missed by the former owners. In one place they drifted a distance of 50 feet only a foot or two away from a fine body of ore.

YAVAPAI COUNTY.

Manager Treadwell has started work on the property of the Brookshire Copper Co., near Jerome.

Supt. Harrington has started up the old Tiger mill in the Bradshaw mountains. He closes down every Sunday.

Courier: Mendenhall Bros. are milling ore from their mine near Senator.——The Cash mine is working twenty men and has from $60 to $100 ore in the tunnel.

YUMA COUNTY.

In the Los Trigos mountains, near the Colorado river, 12 miles from Ehrenburg, miners are making wages. Nuggets from $1 to $10 in value are of frequent discovery. Most of the gold is very coarse; it is saved by scraping the bedrock, the finer gold being saved by dry washer.

CALIFORNIA.

AMADOR COUNTY.

In the El Tarantula mine, near Stent, operated by the El Tarantula M. Co., Ltd., the ore body is slate, intersected by veins of quartz, going $12 per ton.

Ledger: The mill now building at the Central Eureka mine is expected to be in operation in July. The recent crushing of rock at the Zeila mill from this mine averaged about $90 per ton, as follows:

Crushing.	Tons.	Value.
First	185½	$15,000
Second	357	27,000
Third, low grade	220	1,800
Fourth	507	46,650
Totals	1269½	$90,450

BUTTE COUNTY.

F. W. Raymond is going to build a ditch three miles long for the Golden Hill mine at Powellton.

The Golden Hill M. Co., C. J. Blaisdell, Supt., will open a hydraulic mine on Big Butte creek, two miles west of Powelton. They have dug a ditch four miles long to carry 1000 inches of water and give a fall of 250 feet. The company owns 140 acres of mining land. The company has run a cross tunnel 260 feet, showing paying gravel.

The Iron Rock Channel mine, on Butte creek, near Powelton, is building a dam to divert the waters and work the bed of the creek. A. L. Glassell is owner and superintendent.

The Golden Trout mine is employing twelve men. The shaft, three compartments, each 4½ by 5 feet, is being sunk. A new 10-stamp mill is to be put up.

Spencer & Co., at Franklin Hill, are developing a gravel mine, and working a hydraulic mine.

P. Willott, on Pickett creek, eight miles from Franklin Hill, is opening a gravel mine.

Colorado men have bonded the Walters mine on Fall river, and have twelve men employed.

CALAVERAS COUNTY.

(Special Correspondence).— The old Napoleon mine, recently bought by Ben & Lewis Williams is being unwatered and machinery is now on the ground for sinking deeper under the superintendency of John Andrews.

Milton, May 20.

The Ford M. Co. near San Andreas is arranging with the Standard Electric Co. for power for their 10-stamp mill.

The San Pedro mine, Glencoe, is bonded to T. G. Hart for $11,000, the first payment of $1,000 is made. A new hoist is to be erected.

The Angels Echo hears that W. Miller, formerly of the Utica, is to take charge of the Morgan mine, and that work will be on an extensive scale.

HUMBOLDT COUNTY.

(Special Correspondence).—The Orleans Bar G. M. Co. have just completed their flume and ditch. The total length of the canal is 63,066 feet—38,877 flume, 24,189 ditch. The main flume is 5 feet wide, 3 feet deep; the main ditch is 5 feet 6 inches wide on the bottom, 8 feet 3 inches wide on top and 2 feet 9 inches deep. The grade is approximately 10 feet to the mile. The company owns 1300 acres of patented land at Orleans Bar, and the ditch is brought on to the property 700 feet higher than the Klamath river. They purpose using a No. 5 and a No. 4 giant under 350-foot pressure. The main string of pipe is 22-inch, tapering down to 15-inch. The water utilized is brought from Camp creek; the dam is 28 feet high, and the water is diverted through a tunnel some 520 feet long, whence it empties into the main flume. The company have been operating two sawmills and have consumed some 1,700,000 feet of lumber on the flumes. The company's head office is in New York City.

Orleans Bar, May 18.

KERN COUNTY.

The Kinyon mine at Randsburg has leased an 8-stamp mill at Garlock, to which they will haul ore.

MARIPOSA COUNTY.

The chimney of ore found in the Pocahontas mine is reported to yield copper running 50%.

The vein has been struck in the Mariposa mine at 500 feet.

Supt. Bisland of the Nameless M. Co. at Mariposa tells the Mariposan that during the summer he will put up a mill and a dam to furnish water for a turbine wheel to run the mill, air compressor and hoist.

NEVADA COUNTY.

The Texas M. Co. has levied an assessment of 10 cents per share, delinquent July 11.

The Sunflower G. M. Co. will develop and work a mine in Nevada county. H. H. Look, G. H. Clark, R. J. Carpenter, A. P. Booth, A. J. Thomas and R. Jadarola are directors; capital stock, $50,000, 2600 subscribed.

Supt. Davies, at the Texas mine, will sink the main shaft 300 feet deeper.

Supt. Morrell has started the new mill at the Hudson mine, Rough & Ready district. The ore carries so much sulphurets that he has ordered two more concentrators.

The Union hears that the Culbertson mine at Graniteville will resume operations soon.

Operations have been resumed at the Lindsay mine, near Maybert, by W. R. Chadbourne.

PLACER COUNTY.

President Grose of the Pioneer G. M. Co. says in reply to the attack made on the present management by an ex-director: "He first accuses the present management with eating up $100,000 of the stockholders' money, and follows this by a review of operations at the mine, which show that the funds of the company were put to good use. He neglects, however, to mention that $50,000 of the '$100,000 eaten up' was returned to the stockholders in dividends. Mr. Cox mentions that $15,000 was paid for a piece of property to the north of the mine. This, in my opinion, was a good investment. He says that the Pioneer is one of the best equipped mines in California. It is, and the equipment was paid for out of the '$100,000 eaten up.' The American river was dammed and the best water power and electrical plant in California provided for the mine, and the development work 'carried to the verge of the ore shoot,' as he acknowledges, by the present management. All of this has been paid out of the $100,000 that Mr. Cox claims was 'eaten up' by the present management. In fact, everything is in preparation for the opening of the ore body. The assessment will fall most heavily on those who own the stock, and very lightly on Mr. Cox."

PLUMAS COUNTY.

At Johnsville, B. H. Bancroft of San Francisco has bonded the Gold Lake mine.

SHASTA COUNTY.

Workmen are building sixty roasting stalls at the Bully Hill mine.

SIERRA COUNTY.

Supt. Mather, of the Plumbago mine at Moore's Flat, Nevada county, has bought the Oriental mine at Alleghany and projects a tunnel 1300 feet to drain the mine.

SISKIYOU COUNTY.

The Sheba M. Co. has levied a second assessment of 10 cents per share with intent to put more machinery and more work in the mine at Patterson creek.

At the King Solomon mine twenty men daily extract and crush seventy-five tons ore. The company will put a pumping plant at the mouth of Mathews creek to keep the mill running throughout the entire year. This year the mill closes down July 1.

The Union says river miners are getting ready to wingdam along the Klamath river, which is now low and will be low all summer, as there is very little snow in the mountains. Besides being a good season for river mining on account of low water, the Klamath can also be worked by dredger.

TUOLUMNE COUNTY.

At the Rhode Island mine, the main shaft is down over 300 feet. The rock assays $25 per ton.

The Big Betsy mine has consolidated with the Slapjack; the latter will be developed, using the machinery bought for the Big Betsy.

Supts. Carlin of the Rhode Island, Callahan of the Mississippi and Phillips of the Phillips mine propose a dam across the Tuolumne river at the latter mine to furnish power for the mines of Big Oak and Groveland.

At the Longfellow mine, Big Oak Flat, Supt. Coyle's announcement that wages would be cut from $3 to $2.75 a day caused an immediate strike of the entire force except one man.

The Cherokee Gravel & G. M. Co., near Carters, have 290 acres of good gravel ground and will drive their drifts 2100 feet farther to the river bed. A 4-mile ditch from Turnback creek will bring 250 miner's inches with a fall of 250 feet and three giants will turn loose as soon as preliminary work is completed. W. K. Fletcher, Soulsbyville, is secretary.

The strike in the Mazeppa mine, near Stent, is reported as valuable. The vein was tapped on the 300-foot level.

YUBA COUNTY.

The River and Harbor bill contains a resolution directing the California Debris Commission to proceed to construct debris dams with money on hand and to purchase land necessary therefor, and the work of constructing the dam at De Guerre Point on the Yuba river, near Smartsville, may soon begin. California and the U. S. jointly appropriated $500,000 for that work in '96, and since then careful experiments have gone on. Congressional action now makes the amount immediately available.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—The B. & M. mine is in good grade of iron and copper sulphide, carrying gold and silver, at 800-foot level. In crosscutting to the footwall at the 700 and 800 levels some of the most valuable ore was found. The mine is being put in condition to ship regularly. It has been in charge of Supt. R. J. Walter the past year.

Boulder, May 19.

CLEAR CREEK COUNTY.

(Special Correspondence).—The heavy fall of snow and rain in the month of April filled the underground water courses and as a result the mines of the district have an unusual surfeit of water, to handle which the pumps, in numerous instances, are inadequate. This condition has retarded operations to some extent. The month of May, however, will show a large tonnage handled by the samplers and concentrators.

The Sun & Moon, whose shaft contained about 100 feet depth of water, is being pumped out. After it is unwatered the shaft will be sunk deeper with air drills. A shipment of eighty tons of ore was recently made to a concentrator.

The Newhouse tunnel, now in 8500 feet, takes a straight course, a little west of north, has a grade of 4½ inches to the 100 feet, is 12x12 feet in size, contains double car track of 30-pound rails. When carried to completion its terminus will be north of the Concrete mine, at Central City. Its course takes it under Seaton mountain, Russell Gulch and Quartz hill, the aim being to make the tunnel accessible from the mines in the localities named. The rock penetrated thus far is a mica schist and porphyry dykes. The rich body of steel galena recently struck, about which much has been said, is about 8500 feet from the tunnel entrance and 2300 feet below the surface of the Gem and Gem Extension and the Freighter's Friend. The discovery in the tunnel is important, demonstrating, as it does, the great width and richness of ore at 2000 feet depth. By it is proven that in this case, at least, the "values go down." The ledge discovered is claimed by the Gem Extension and Freighter's Friend owners, who believe the following of their vein to great depth will prove it to be identical with the one opened in the tunnel.

The Gem and Gem Extension, under the management of W. E. Renshaw, are opened by an incline shaft 600 feet deep, which recently has been retimbered thoroughly by square sets from top to bottom and with stulls in the stopes. A skip of 2500 pounds capacity operates in the incline on a 32-inch gauge by a steam hoist.

The Freighter's Friend, managed by John Owens, has a 200-foot shaft, with levels run at various stations.

The Trust, belonging to Hiatt Bros., has a 90-foot incline, in which a vein from 6 inches to 2 feet wide, with a pay streak 3 to 6 inches wide, running $60 to $100 per ton in gold, silver and lead.

The property of the Seaton Mountain M. Co., on the southern slope of Seaton mountain, is being vigorously worked through a 1200-foot tuunel, at the breast of which a connection has been made with the old workings from a vertical shaft. A drift on the vein has also been run 500 feet from the tunnel. The tunnel runs northward, the vein which it cuts running east and west and pitching to the north. Shipments amount to about ten tons per day, the bulk of which is sent to concentrators. The ores are a lead-zinc sulphide, whose chief values are silver and lead. New ore bins are being erected at the mine and Manager J. J. May states that it is the intention to use electric power as soon as same can be procured.

The Crown Point & Virginia shaft is 715 feet depth, the lowest working level being 585 feet deep. A new hoist and compressor are being put in, with the intention of sinking deeper. The new hoist is 12x16, double geared. This company is operating the old Wilkie mill, which they have increased to a capacity of sixty tons per day, and Supt. W. H. Knowles states that it is the intention to further increase it to 150 tons capacity, making it a complete concentrating plant. At the mine a new shaft house and ore bins are being erected. The ores are an iron and copper sulphide, carrying, gold, silver and copper. At present the mill is being operated on ore from the dump formerly discarded.

The Gold Discovery Co., owning the Dove's Nest mine, is unwatering the property at present. Their shaft is 635 feet deep, with drifts both ways therefrom at each 100-foot station. The ores are iron and lead sulphides, the lead values predominating. Manager E. C. Eddie states that the property shipped about 3000 tons of good ore in 1899, and that shipments are soon to be resumed.

The Jackson concentrating mill, chiefly owned and managed by J. G. Roberts, is handling about forty tons of ore per day. Its equipment of crushers, coarse and fine rolls, Huntington mills, jigs, slimers, buddles and tables is of a kind well suited to the ores of the district. It enables them to make numerous gradations of the material handled and suit each grade to the process best adapted to it. For instance, the jig product is separated by sizers, part going to the rubber belt slimer, a part to the Cammett tables, the second from the latter going to the buddles. The slimer, which is 32 feet long and 5 feet wide, catches the light slimes from the three 14-mesh jigs. The results are very satisfactory to the miner.

Idaho Springs, Colo., May 16.

FREMONT COUNTY.

At Florence the new chlorination mill being erected by the Union G. Ex. Co. will be the largest in the State. The company will employ about 200 men at $2 per day of eight hours. The storage room will have a capacity of 6000 tons for reserve. This company intend to purchase their ore, like other custom mills, as they own no mines, and the ore will be from the Cripple Creek district. The chlorination room will be 30x208 feet, the roaster building 100x300, the electric power house 75x75. There will be 210,000 square feet under cover. The mill will be automatic from the bedding floor to the chlorination barrels. An electric pump will be placed in a reservoir in the bed of the Arkansas river having a capacity of 500,000 gallons each twenty-four hours, the amount required. J. E. Rothwell is superintendent of construction.

GILPIN COUNTY.

(Special Correspondence). — The East Whiting mine on Seminary hill is shipping twenty-five tons per day to the Mixsell mill at Idaho Springs. Frank H. Clark is Supt.

The Gunnell mine is now working a force of about 100 men and produces about 125 tons of ore per day, all of which is milled. The 1100-foot shaft is being sunk to the 1300 level. Most of the present output comes from below the 1000-foot level.

The Central City, in charge of John J. Reilly, is shipping 150 to 200 tons per month. The Delaware is shipping 350 tons per month to concentrators at Idaho Springs.

The Kansas-Burroughs is keeping up a shipment of about 4000 tons per month.

It is expected the Phœnix shaft of this company will soon be sunk from 1200 to 1300 feet. Most of the ore from this group is milling material.

The New York mill, in charge of W. H. Coffin, recently put up new ore bins, with facilities for receiving ore either from the district tramway line or from ore wagons. They also have provided trackage and elevators, by which the ore is carried to crushers and from the latter to the stamps. They now have fourteen automatic feeders. This mill has fifty slow drop and twenty rapid drop stamps, which operate by water power. Its capacity is 150 tons per day. WASCOTT.

Central City, May 19.

At the California mine the water is gaining. On Sunday 271 barrels of water of 400 gallons each were hoisted from a depth of more than 1700 feet.

The East Whiting mine on Gunnell hill is reported sold for $100,000 to Abbott & Joy of Salt Lake, Utah, and A. H. Baldwin of New Orleans.

HINSDALE COUNTY.

Supt. Ray will build a mill on the Tobasco, near Lake City.

The Contention mine is sold to the Megunticook G. & C. M. Co. for $30,000.

HUERFANO COUNTY.

A rich strike is reported on the Lyle B. claim, owned by the Rossdale T. & M. Co., on the western slope of Mount Blanca. At the 50-foot level a vein of ore is said to assay $500 per ton.

LAKE COUNTY.

(Special Correspondence).—The Sedalia shaft, now 790 feet deep, will be sunk 150 to 200 feet deeper, with the idea of cutting the lower contact.

An effort is being made to effect a consolidation of the Home M. Co. and the New Leadville M. Co., a proposition vigorously opposed by many of the Home stockholders. A meeting of the stockholders of the Home Co. will occur in June, at which the question will be decided. The Home Co. is now reducing 400 tons of ore per day from its three different shafts.

The Maid, Small Hopes and Moyer each produce a heavy zinc tonnage, much of which is shipped abroad. A shipment of 2000 tons was made the last few days to a zinc smelting plant in Belgium.

It is estimated the output of Leadville mines for May will aggregate 100,000 tons, which is fully double the monthly tonnage of 1898. The metals which make up the marketable product of these ores, worth about $1,500,000 per month, are gold, silver, lead, manganese, zinc and copper.

Leadville, May 20.

J. H. Weddle will enlarge the Union Smelter at Leadville.

OURAY COUNTY.

Manager Benson of the Camp Bird, Ouray, is arranging for a cyanide plant of 100 tons daily capacity, to be in operation July 15. The mill will have eight leaching tanks, each with a capacity of fifteen tons of ore, and four solution tanks. The tailings to be treated will be raised with a sand pump to the leaching tanks. There will be two sets of tanks, one for a strong and the other for a weak solution. The ore requiring a particular strength of solution can be treated at any time without waiting for a cleanup of the mill.

SAN JUAN COUNTY.

(Special Correspondence).—W. F. Kendrick of Denver is here this week and has satisfactorily and definitely arranged all matters in connection with the erection here of a 200-ton pyritic smelting plant.

Silverton, May 16.

(Special Correspondence).—It is given out that a wire-rope tramway will be constructed from the North Star mine to the Crook mill—a distance of 4 miles. The first purpose of such a conveyor is to enable the operators to mill the great tonnage of ore on the North Star dump.

Silverton, May 20.

SAN MIGUEL COUNTY.

Telluride Journal: The net profit of the Butterfly–Terrible mine from the first nine days' run with twenty stamps was $1880, in bullion and concentrates. It is proposed to add a cyanide plant and to begin shipments of smelting ore.

TELLER COUNTY.

A. E. Beal has returned to Cripple Creek from California and organized the Cripple Creek H. M. Co., in which he says W. S. Tevis of San Francisco is heavily interested. The company is incorporated for 1,500,000 shares. It is proposed to sink a three-compartment shaft 1000 feet and prospect from that depth under the city of Cripple Creek.

Victor says that W. S. Stratton has offered $200,000 for the Pharmacist mine.

IDAHO.

ADA COUNTY.

Marsh & Moss have bonded to W. E. Pierce & Co., agents of J. R. De Lamar, four claims in Miller mountain district. In sixty days, if the mines make the showing desired, $10,000 is to be paid, and at the end of the year $50,000 is to be paid.

KOOTENAI COUNTY.

E. L. Abrams, Gen. Mgr. Idaho G. C. M. Co. of Cœur d'Alene, intends to equip the mines with a steam hoist and four-drill air compressor plant and erect permanent buildings.

OWYHEE COUNTY.

Engineer Johnston's report on the Snake river dam is favorable, and work will begin immediately, says Supt. Hutchinson of the Trade Dollar Con. M. Co. to the Silver City Avalanche. The enterprise contemplates the damming of Snake river at Swan Falls, some 6 or 8 miles above Guffey, to generate electric power for transmission to the Owyhee mines and mills. W. White of Boise will be in charge of the work as Supt., A. J. Wiley will be chief engineer, T. Johnston will be consulting hydraulic engineer and L. B. Stillwell consulting electrical engineer. A rock crib dam, giving a fall of 15 feet, will be put in and the power generated with turbine wheels. The possible H. P. will be 12,000, but only 1500 will be installed. The power will be transmitted 26 miles to Silver City and distributed to various plants.

SHOSHONE COUNTY.

At Murray the Golden Chest has stopped shipping its concentrates—twenty tons per month. They are being sorted at the mill, and a small cyanide plant will be put in.

The Cœur d'Alene Development Co. will put a hoisting plant on the Silver King mine in Government gulch, near Wardner.

MICHIGAN.

At Houghton the Arcadian strike was settled by the company granting increase of $4 per month to trimmers and miners and making time 1 o'clock Saturday afternoons.

The new $100,000 stamp mill of the Mass M. Co. will be on Keweenaw bay, 16 miles of Houghton, at Ogima. R. T. Mason will be Supt. of construction.

MONTANA.

JEFFERSON COUNTY.

A miners' union will be formed at Richmond Flat. It is stated that Mgr. Knox, of the Monitor and Revenue properties, proposed to pay miners $3 per day, which is 50 cents less than the former price in that district.

LEWIS AND CLARKE COUNTY.

Supt. Burrell, Montana M. Co., reports as the result of mining and milling ore and the treatment of the tailings for six months, the total receipts were $344,679, and the expenses of operation $282,567. Operations were continued at the dam tailings plant from July 1 to December 20, a period of about five and two-thirds months, during which time there were treated 69,573 dry tons of tailings from dam No. 4a, from which a net profit of $84,621.48 was realized. The large tonnage of very fine material (slimes) which is at present being separated from the coarser sands will be worthy of attention after the sands, which are amenable to the present process, have all been passed through this plant. There can be no doubt that a substantial profit can be realized from these slimes by making some mechanical changes in the present plant after the material now being treated has been exhausted. There is also another very likely source of revenue to be derived from the operation of this plant at some future time, that is in the treatment of all the fine sands left in the gulch from the placer mining which was done years ago. This would require the handling of all the gravel washed by the old sluice-box methods, and a system of sizing by some economical modern machine. The values would first be determined by sampling, and this could be readily done when the water of the creek was not in use for other purposes, as it is at present. My opinion is that there would be a very satisfactory recovery of the coarse gold by the adoption of the usual method of sluicing over riffles the gravel left in the old workings, and then leaching the remaining fine sands to recover the fine gold. The development of the mine consisted of 3500 feet of shafts, drifts, crosscuts, upraises and winzes, at a cost of $53,066.44, or $2.15 per ton of ore treated. "I regret to be again obliged to report an unsatisfactory condition of affairs in the mine. The great disappointment met with in our development at the No. 3 shaft part of the mine brings with it the grave fears of not being able to keep the mill employed while we are endeavoring to solve the complications connected with our work. There are two principal points of attack left to be explored, the first in importance being No. 3 shaft, Nine Hour. Our winze, through which this work is being done, is now very near the 1200-foot level, and within a few days we shall be drifting south on this level. The other point is the New Castletown, 600-foot level, which should be driven 600 feet more to prove what there is in the ground. Until this work has been done I am not prepared to say what the next half year may have in store for us."

MADISON COUNTY.

M. W. Alderson, at Leiterville, will put in a small refinery to send out his gold dust as bullion, instead of shipping it for refining.

Thos. Teal, Mgr. Twin Bridges smelter, says that the shut down was for alterations in the plant.

The Kennett mine at Virginia City is closed down and all the men discharged. Mgr. Millard says the cessation of work is but temporary.

NEVADA.

CHURCHILL COUNTY.

F. W. Inman says he has tin ore 25 miles east of St. Clair, at Sand Springs, that has 17.53% tin. He asserts that ore sent to Swansea, Wales, gave such returns.

LANDER COUNTY.

Ex-U. S. Treasurer A. J. Gilfillen and Matthew Vassar of Vassar College have bought for $30,000 the properties of the Battle Mountain M. Co. There is said to be considerable ore that would yield 5% copper, $3 in gold and a fractional amount in silver.

LINCOLN COUNTY.

The Miners' Union of De Lamar raised over $700 for the widows and orphans of the Scofield, Utah, mine accident.

NEW MEXICO.

BERNALILLO COUNTY.

(Special Correspondence).—Arriving at Santa Fe over the Denver & Rio Grande Railway, the writer proceeded westward 40 miles to the Cochiti mining district, crossing the Rio Grande at the old Cochiti Indian Mission, which was established more than three centuries ago, the relics of whose adobe and cement covered buildings stand as a reminder of historic days. The Cochiti mining district lies at a point on the eastern slope of the Cochiti range, 10 to 12 miles west of the river crossing referred to. The district covers an area of 4 by 5 miles, near the heads of three parallel canyons which drain eastward to the river, known as Pino, Colla and Peralto canyons. The main wagon road goes up Pino to the town of Bland, above which is the Lone Star mine, belonging to the Navajo G. M. Co., and a mile below town is the mill of the Bland M. Co. At the mouth of this canyon is the mill of the Cochiti Reduction & Improvement Co., whose mine, the Iron King, endlines with the Lone Star above Bland. Three miles south of Bland, in Colla canyon, is the Albemarle mine and mill, belonging to the Cochiti G. M. Co.; farther to the south is Peralto canyon, in which are numerous mining locations and near the head of which is the water supply of the Albemarle property, the water being piped by gravity to mine and mill 7 miles. (See page 577).

At the Madrid coal mines, near Cerrillos, on the Santa Fe R. R., is the electric power plant of the Cochiti G. M. Co., enclosed by a steel building, with asbestos lining. The 600 K. W. three-phase generator is driven by an 800 H. P. direct-connecting Corliss steam engine, the fuel used being screenings from the coal yards. At this power plant the 600 volts are transformed to 20,000 for line transmission to the sub-station at the Albemarle mine, 31 miles distant. Here step-down transformers reduce the voltage back to 550, which is the voltage used on the motors. The pole line is of three No. 4 wires for current transmission and two No. 12 wires for telephone work. The transmission circuit is transposed every half mile and the telephone circuit every five poles. The poles are 28 feet long, set 5½ feet deep, 30% of the number being in solid rock.

At the mill and mine are electric motors of various capacities. The belted, two-stage air compressor is operated by a 175 H. P. motor; the double drum hoist over the mine shaft is run by a 100 H. P. motor, giving a rope speed of 1000 feet per minute. The mill is operated in two sections, each by a 150 H. P. motor, by which each section may operate independently of the other; two motors of 20 H. P. each operate the Pelatan–Clerici equipment, and there are two or three 10 H. P. motors for various other work.

The Albemarle ledge trends north and south through a porphyritic formation and is 75 feet wide in some places. It is opened by an incline shaft which follows the dip of the vein to 500 feet depth. At each 100-foot station a drift from 200 to 500 feet from the shaft has been run, the ore being taken out from wall to wall, showing remarkable width. In various places the ledge is divided by porphyry horses, leaving vein matter of 10 to 30 feet wide next to each main wall, making it appear like parallel veins. The ore is a hard, whitish quartz, considerably oxidized, containing little sulphurets, carrying gold chiefly and some silver. The mine is in condition to produce a large tonnage of ore.

Over the shaft is a steel gallows-frame, erected specially for incline work. The ore passes through an ore bin over grizzlies, separating the fine from the coarse. It is conveyed in cars to the crushing floor of the mill, where there are two crushers, below which are four sets of 26-inch and four sets 36-inch rolls, through which the hard quartz passes; the talcose and loose material is carried direct to four Huntington mills. The product of the rolls undergoes a thorough process of screening, thence through revolving driers, and after passing through the finishing rolls is carried to the leaching tanks, where the straight cyanide solution is applied. The material from the mills is treated in eight vats by the Pelatan-Clerici process. In the leaching department of the mill are twelve 120-ton tanks, six of 60 tons each, and eight tanks of 200 tons each, making a leaching capacity of 3100 tons. As equipped at present the mill can crush from 8000 to 9000 tons per month. At the point where this mine and mill are located the canyon is very narrow and has high and precipitous sides, leaving no abundance of room for buildings and deposition of tailings. The mill is operating, but not at its full capacity, though it is expected too soon.

In Colla canyon the Lone Star, or Navajo, mine occupies the northern slope of the mountain and is developed by a system of tunnels, one above another, which crosscut the ore body at the vertical distance of about 100 feet apart. The lowest tunnel is now being driven. It is in 575 feet and is expected to cut the ore body at 900 feet from entrance and 200 feet below present lowest workings and at a point 700 feet below the vein apex. The property was opened six years ago on its upper levels, from which $60,000 worth of ore was hauled to the railroad and shipped to the smelters. Then only the high-grade ores were sought and large bodies of what may be designated as milling ore were left exposed. On the upper levels great chambers were worked out near the surface, showing a vein expansion to over 100 feet in width in places. On the lower levels the vein is more regular, between well-marked porphyry walls, and ranging from 10 to 30 and 40 feet wide. The ores are sulphides, arsenides, antimonides and tellurides. The silver is found mainly in the antimonial ores; the tellurides are in the sylvanite and petzite forms. It is stated that by fine pulverization, roasting will not be required and that the requisite saving can be made by cyanide work. The Bland mill has been running much of the time for the purpose of working out the problem of extracting the values from these ores.

In the lowest working level a small hoist is operating by compressed air in sinking 200 feet to the level of the new tunnel. This shaft is 850 feet from the surface horizontally. Plans are being made by the Navajo Co. to erect a 300-ton mill at a point 1½ miles down the canyon and will connect mine and mill by an electric tramway. As soon as the lower tunnel shall have been completed and a connection made with the upper workings, all the ore will be handled through it. The Cochiti G. M. Co., the Navajo G. M. Co. and Bland Milling Co., while each operates under a separate organization, are all under the same general management. Hence, the electric power for the proposed Navajo mill and other equipment will be furnished by the Cochiti power plant described above. The Bland mill has ten stamps and cyanide process.

The Cochiti Reduction & Improvement Co., under the management of W. C. Wynkoop, has just completed a pan amalgamation and cyanide mill at Woodbury, at the mouth of Colla canyon. The mill has three sets rolls 12x24 and 16x30, White-Howell roasters, pans and settlers. When cyanide is used it is decomposed by zinc-copper amalgam in the pans. An electrolytic current from a low voltage dynamo is used to aid in decomposing the cyanide and in precipitating the gold on the quicksilver in the pans. The ores from this company's mine, the Iron King, are siliceous, 85% to 90% insoluble, with values contained in an arsenical pyrite, being about 40% gold and 60% silver. The pyrites carry about 1½% sulphur, ¼% arsenic. The gold occurs as metallic, is readily amalgated, but the silver is extracted with greater difficulty. The mill at Woodbury has not at this writing begun operating.

In general, the ores of the district, taken as they are mined, without sorting, run from $12 to $15 per ton, of which gold predominanes in some mines and silver in others.

Mr. Johnson is manager at the Albemarle, V. V. Clark at the Navajo; O. P.

Posey is general manager of the Cochiti, Navajo and Bland Companies.

The D. & R. G. is said to have let large contracts for railroad ties, which is construed to mean that they will build out of Santa Fe toward Bland. The Cochiti & Northwestern Railway Co., organized by Maj. J. H. Purdy, has projected a railway line from Thornton to Bland, though actual work of grading for it has not begun.

Bland, April 27. WASCOTT.

SOCORRO COUNTY.

(Special Correspondence).—Socorro, 76 miles south of Albuquerque, is in the valley of the Rio Grande, at an altitude of 4500 feet, and is the location of the New Mexico School of Mines. This institution has a well-planned stone building, which is well equipped and fitted up with appliances for instruction, has about sixty students in attendance and four instructors. About $9000 per year have, of late years, been appropriated for the expenses of the school. Near town is the abandoned Rio Grande smelting plant, which ran in former years on ores from the Kelly and other mines in the Magdalena mountains.

The railroad branch, running westward from Socorro to Magdalena, 28 miles, makes an ascent of over 2000 feet. The latter town, located on a level plain, four miles from the foothills of the Magdalena range, is a trading point for the miners and for stockmen for a long distance westward. The little town of Kelly, at the foot of the range, is 1000 feet higher than Magdalena.

The principal mines of the district are opened on the western slope of one spur of the range, the veins having a north and south trend. Such mines as the Graphic, Kelly, Ida Hill, South Juanita and Hardscrabble appear to be of most importance.

The Kelly was a heavy producer from 1882 to 1888, under the management of G. Billings, its owner. It is now under lease to Connelly & Babcock, of Kelly, who are shipping a small tonnage and doing considerable of dead work for development purposes.

The South Juanita, under lease to Courtney & Thorpe, is shipping 75 to 100 tons per month from three different levels in a 135-foot shaft. It is asserted their ores contain from three to five ounces silver and about 35% lead in form of carbonates and sulphides.

The Ida Hill group is being operated by Byron & Fitch, lessees, who ship 200 to 400 tons per month of carbonate ores, bearing about an equal quantity of iron and silica, making it a neutral ore from a smelting estimate.

The Graphic mine and Graphic smelter have been operated several years by Capt. A. B. Fitch, lessee, with Max B. Fitch Supt. of smelter and Geo. A. Byron Supt. of mine. The smelter and mine are a mile and a half apart, connected by an ore-car tramway line of railroad gauge, part of which is built on a 10% to 15% grade, making a descent from mine to smelter of 500 feet. At one point is a curve on a 50-foot radius and 10½% grade. The loaded cars, holding 2½ to 3 tons each, are sent down to the smelter by gravity, the speed being regulated by hand brakes. The empty cars are drawn up to the mine by horse power and are loaded through chutes from ore bins, which receive the ore from the main working tunnel.

The mine is opened by means of six levels of the vertical distance of about 100 feet apart, which are connected by means of chutes and inclines. This work discloses what appears to be one vein in the upper levels, and two parallel veins from the third to the sixth, the one great ledge having been divided by a limestone strata from the third downward. The veins have a 45° dip westward and are from 5 to 50 feet wide, standing within a limestone belt, and the latter bounded by shale on one side and by an altered quartzite on the other. The ores comprise iron in the forms of pyrites, red and brown hematites, magnetites and lead in carbonates and sulphides, with important silver values with the lead; there are small copper values which are taken into account by the smelter. On the sixth level a body of zinc sulphide is encountered at or about water level, none of which is being taken out at present. In the lead-carbonate sections a high-grade tonnage of "sand carbonates" are obtained, which consist of lead crystals of sand fineness. The different forms of iron ore, which occur in large bodies, are mined and sent to the smelter as a fluxing material only, as its lead-silver values are very small. The two upper levels are on the one vein, but from the third downward, there being practically parallel veins, the two are connected by crosscuts through the lime horse. Stopes have been carried from level to level, showing a very regular wall formation in most places and is timbered up with stulls. The mine is producing from 75 to 100 tons of material per day, which goes down to the smelter as ore and flux. Near the main tunnel entrance are great lime quarries, from which such lime as is required by the smelter is cheaply obtained.

The Graphic smelter, equipped with a 42x120-inch lead furnace, 18 feet from tuyere to charge floor, has a capacity of 100 tons per day, counting fluxes. The product is about ten cars of bullion per month, as well as a small amount of copper matte. The furnace has no flue dust chamber, the stack continuing the same inside dimensions for 18 feet above feed floor and on account of this height of furnace charge there is little flue dust. Steel plate water-jackets are used, to which water is fed by branches from a 3-inch pipe line. The hot water from the jackets is pumped to a reservoir having a device for cooling it, and after being cooled it is used over again. The water supply is pumped from a well in a draw near by. The charge for the furnace is figured to produce a slag of definite composition, the following being a fair example: SiO_2=30; FeO=32.5; CaO=18.5; total, 81. An interesting and unusual fact concerning the Graphic is that the mine furnishes practically all the material required by the smelter.

The Hardscrabble mine, belonging to virtually the same parties who operate the Los Cerrillos smelter, ships its ore output to the latter plant. WASCOTT.

Magdalena, May 1.

OREGON.

GRANT COUNTY.

Near Prairie City of the Oregon Wonder a Spokane correspondent says: "At the point of location it stands up in a solid ledge over 300 feet above the surface of the earth, and lies across a hog back, and can be tunneled either on the ledge or across the vein."

JACKSON COUNTY.

J. S. Howard, chief engineer High Line ditch, that is expected to bring water from Rogue river to Gold Hill, says the work of digging the 4-foot berme on the right of way is progressing, several miles being already prepared for excavation on the Gold Hill end. A right of way has been granted the company by the Southern Pacific Co. for a 50-foot strip 35 miles long. There now remain but a few rights of way to be obtained along the 93 miles of line. When this right of way has been secured contracts will be let for digging the ditch in 10-mile sections.

UTAH.

BOX ELDER COUNTY.

The Promontory M. Co. is incorporated with a capital stock of $50,000. T. D. Johnson is secretary. The company owns the King Philip and eight other mining claims.

JUAB COUNTY.

Mgr. Farnsworth tells the Miner that plans for fifty stamps for the Bullion-Beck mill have been perfected.

SALT LAKE COUNTY.

At Bingham, J. S. Grow will next week begin work on the Baltimore group of claims.

Tribune: The new electric motor of the Bingham Tunnel Co. has been placed in the central station, and preparations are going forward to install the big air compressor. Work on the tunnel has been very slow, owing to the hardness of the rock which has been encountered 2200 feet from the opening, from 10 to 12 inches a shift being all that can be accomplished. The work of driving the tunnel will be hastened by the use of the machine drills, and the company expects to be able to drain the Dalton & Lark mine in about seven months' time. By the means of a 12-inch pipe which ventilates the tunnel, all danger of foul air is reduced to a trifle, and by means of a fan suction all the smoke from the blasts is drawn away. The tunnel will enter the Dalton & Lark properties 300 feet below the depth reached by the shaft.

WASHINGTON.

FERRY COUNTY.

The Manila property is bonded to P. Clark and a contract let to run 400 feet of tunnel. The Manila M. & M. Co. is incorporated at Keller.

OKANOGAN COUNTY.

(Special Correspondence).—Last June a company composed of Chicago and Washington State residents acquired a group of fifty mining locations and three mill sites on Palmer mountain, 6 miles north of Loomis, and incorporated the Bull Frog G. M. Co. (See pages 573 and 580.)

Palmer mountain at this point rises 4500 feet above the shore of Palmer lake, 3500 feet of which ascends at almost 45°, the Bull Frog group being located so as to extend from the lake up the side and taking in a portion of the top of the mountain, in form of 5000 feet east and west and 7500 feet north and south. Running through this ground are sixteen parallel cropping veins in a northeast and southwest direction.

The principal work has been done on the sixteenth vein, or the one farthest up the mountain, and consists of about 250 feet of tunnel work and a vertical shaft 130 feet deep, from the bottom of which a crosscut drift has been run 219 feet to cut the vein, and in so doing they encountered ore 85 feet from the shaft, a well-defined foot wall, and from there on to 219 feet, where a well-defined hanging wall was encountered, five ore bodies were crossed of between 4 and 12 feet in width, while the formation between was more or less mineralized. Drifting was then started on all five of the ore shoots, and the past three months has demonstrated almost beyond question that these ore bodies all run into one vein, which assays $4 to $12.50 in gold, averaging $8 in gold, with some silver and iron.

When the Bull Frog Co. was organized they also acquired what was known as the Wyandotte cyanide mill, which they are now removing to one of their mill sites on Palmer lake to treat this ore. Before so doing, however, they ran a quantity of ore taken from this sixteenth vein through the mill, and found that it yielded to that mode of treatment, as, for instance, in one run of eleven tons assaying $19.50 gold $17.50 was saved.

Before striking this ore body it was the intention to run a crosscut tunnel which would cut these sixteen veins at 2000 feet depth, but the quantity of ore now in sight permits them to develop the other veins at their leisure, and they will put a power hoist on the sixteenth vein and build a tram from mine to mill and begin active mining and milling. This is perhaps one of the most important developments that has been made on Palmer mountain in width of vein and quantity of ore.

The Black Bear–War Eagle Co., who have been putting the Black Bear mine and mill in shape, have made a thirty days' cleanup from five stamps on a run of 300 tons of ore, the result being 470 ounces gold saved by amalgamation, and ten tons of concentrates of the value of $150, making the ore value about $30 per ton in gold. The shaft is now down at the Bear mine 250 feet, with drifts each way to veins No. 1 and 2, where drifts are being run each way on the vein, and 500 feet of new stoping ground has been added in the past sixty days. They are developing far ahead of present needs for mill supplies.

Fifteen more stamps are to be added, and a hoist and 20 H. P. gasoline engine will be placed on the War Eagle, and a shaft put down to 500 feet, with levels each 100, on the main vein. They will also continue the Bear shaft to 500 feet depth this season.

In the crosscut tunnel being run at the Wehe Consolidated a second vein has been crossed, 6 feet in width, carrying good ore. The hoist will soon be in place on the Wehe vein, and the shaft continued from the 200-foot level, where it now is, to 500 feet. This vein has been cut at 200 feet and found to be 14 feet wide. Many improvements and much work are in contemplation, which will be taken up when the managing directors arrive here the coming month.

The Palmer Mountain tunnel has reached a length of 3100 feet, gained 1225 feet vertical depth, and crossed twenty-two veins from 2 to 40 feet wide. The company have now nearly reached their first objective point, that of cutting the vein which crops on the Helena Belle location, and one of the strongest showings on the mountain, it being agreed that no active mining would be done or method of treatment adopted until this point was reached. Plans are formed for development of these veins, as well as the improving of their water power electrically, giving them 3000 H. P. if desired, and the erection of a plant for treating the ores, which will probably include a combination of stamps, concentration and cyaniding, requiring an outlay of $250,000 and a year's time to fully complete.

The present year has seen the starting of three mills in the district, aggregating twenty-five stamps, which produced for the thirty days of April about $40,000 from 2000 tons of ore, exclusive of the values in the concentrates. These mills are now adding sufficient stamps to increase the output to $100,000 monthly, which they will do within ninety days. The whole district is assuming a decidedly permanent system of development of ores, and treating the same upon economical and latest gold mining methods, and is doing as much in the way of bringing the State of Washington into prominence as a gold producer as any camp in the State, and is unique in one respect, viz., a total absence of stock speculation, every property being developed on its merits.

Loomis, May 1. JOHN I. BOOGE.

STEVENS COUNTY.

At Northport furnace No. 3 is blown in at the smelter. Ore is received from Rossland at the rate of 500 tons daily.

SPOKANE COUNTY.

R. K. Neill of Spokane has secured control of the water power at Post Falls and proposes to erect a $500,000 electric power plant there, to furnish power for the operation of the mines in the Cœur d'Alene country, wires to be strung 65 miles to Burke, Idaho.

FOREIGN.

BRITISH COLUMBIA.

In the Grand Forks district the Jewel mine in Long Lake camp will put in a cyanide plant.

Development work on the Winnipeg mine to date exceeds 3500 feet.

The new tunnel on the Snowshoe in Wellington camp is in 160 feet.

The spur to the Brandon & Golden Crown mine in Wellington is completed. The ore bins are full awaiting cars for the smelter. The main shaft is down 322 feet and the total work on the property is about 2250 feet. The plant comprises a seven-drill compressor.

At Rossland the Evening Star has a seven-drill compressor plant, an air pipe line from the compressor plant to the working of the Evening Star, with two power drills at work.

Near Rossland the War Eagle and Center Star mines have let new mining contracts and now have almost a full complement of men. All the work in the War Eagle is being done from the fifth to the seventh level.

Two strikes are reported in the Kamloops mining district: the first on the Wheel Tamar, group copper gold ore, averaging 8% copper and fair gold values: the other on the Tenderfoot at Copper Creek: bornite ore, showing grey copper.

CANADA.

The Ontario Government's mining bill abolishes all royalties on minerals, but provides that the Lieutenant-Governor-in-Council may impose a mineral tax on the gross quantity of the ore mined. The tax will be at the following rates:

Iron 50 cents per ton; zinc $5 per ton, or $15 per ton of metal contents if partly treated or reduced; copper $2 per ton or $25 if partly treated or reduced; nickel $10 per ton or $60 if partly treated or reduced; copper and nickel ore $7 per ton, or $20 and $50 a ton, respectively, per ton of metal contents if partly treated or reduced; all other ores, such rates as may be imposed by order-in-council, but not to exceed 5% of the selling prices thereof in a free market. A license, to cost $10, shall be necessary to mine any of the metals for which a license is imposed. It is provided, however, that where such ores are smelted or treated in the Dominion of Canada, in such a way as to yield fine metals, or any form suitable for direct use in the arts without further treatment, the tax may be remitted. The tax will not apply to mines where the annual output of ore is less than 500 tons. A further provision in reference to the tax is that by proclamation it may be remitted, or a lower rate substituted in case of ore or minerals refined in the United Kingdom, or any British colony or dependency. Another clause ratifies the order-in-council providing that all lands patented or leased will contain the conditions that the ore be refined in Canada.

A number of further clauses contain

This Paper Fifty-Two Times, POST PAID, $3.00

provisions which are intended to safeguard the miners in the use of explosives, the internal working of the mines, and a complete code of signals for hoisting and descending the shaft. All reservations of mines, ores and minerals contained in patents issued prior to July 1, 1897, are to be rescinded.

Personal.

J. H. BROWNLEE of Atlin, B. C., has returned from San Francisco.

H. B. C. NITZE is at Rico, Colo., examining the Atlantic Cable mine.

J. B. MOULTON is now local manager N. A. G. D. Co., Breckenridge, Cal.

EDWARD BAER succeeds Wm. Seltz as Supt. Golden Chest mine, Murray, Idaho.

B. F. JANES of Berkeley, Cal., is considering an offer to go to Guayaquil, Ecuador, S. A.

A. R. LEDOUX of New York City is examining mining property at Gilt Edge, Mont.

H. WEBB AND HANS C. BEHR left San Francisco on the 19th inst. for South Africa.

J. L. GIROUX, manager United Verde mines, Jerome, Ariz., has returned from Sonora, Mexico.

SUPT. F. MILLS of the Merced M. & M. Co., has returned from San Francisco to Coulterville, Cal.

H. P. GORDON of Plymouth is one of the 1000 California miners who sails this week for Cape Nome.

S. P. DORSEY has been elected Pres. and Supt. Maryland, Cal., M. Co.; L. V. Dorsey secretary and treasurer.

O. B. BACHMAN is manager American M. D. Co.'s copper properties at Plain View, ten miles from Globe, Ariz.

GEORGE J. HOFFMAN of San Francisco has again gone to Siberia, to examine and report upon placer properties.

R. J. PROVINES, formerly of the Golden Cross mill, Hedges, Cal., is Supt. Boston & Denver mill, Blackhawk, Colo.

A. D. GASSAWAY, late Supt. Magnolia mine, is Supt. DeLong river mines, on the North Fork, Placer county, Cal.

HUBERT VISCHER of the California State Debris Association has returned to San Francisco from El Dorado, Cal.

CHAS. SWEENEY of Spokane, Wash., says he will this summer put a 50-stamp mill on the Big Buffalo, Idaho, mine.

LEO VON ROSENBERG of New York City is examining California mining property. He is in San Francisco this week.

R. C. SHAW, late Supt. Warrington M. & M. Co., Havilah, Kern county, Cal., has gone to the Bellavista & Thayer M. Co., Costa Rica, C. A.

L. C. GRIFFITH of Atlin, B. C., was in San Francisco this week, buying $12,000 worth iron pipe for one of that region's extensive hydraulic enterprises.

I. N. HIBBARD, Gen. Supt. Alaska Exploration Co., and H. A. Brigham, Supt. mining department, sailed on the Zealandia for Cape Nome on the 21st inst.

H. W. FAIRBANKS of Berkeley, Cal., accompanied by Arthur Halloran of San Francisco, started this week on a geological reconnoissance of northern California and eastern Oregon and Washington.

COL. D. H. JACKSON, the veteran California and Nevada miner, goes to Cape Nome—one of the old Argonauts who goes ever onward in search of the golden fleece. He is accompanied by his son Clyde.

A. DOLGUROUKOFF is in San Francisco in the interests of the Russian-American Commercial Co., a part of whose plans is to develop some Siberian mining concessions recently acquired. An exploring party is being formed, which will be accompanied by G. D. Roberts.

A. HAYWARD AND C. D. LANE have returned to San Francisco from Angels, Cal. The latter goes this week to Cape Nome. He says: "Most people think the beach sands are all that is up there. They are important, but I am not interested in them at all. All our diggings are in the hills and the gold is coarse."

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC LOCKING MECHANISM FOR SIDEWALK OR OTHER ELEVATOR DOORS.—Peter H. Jackson, San Francisco, Cal. No. 648,624. Dated May 1, 1900. This invention relates to an automatic mechanism for securing and releasing elevator hatchway doors, and is especially applicable to the doors which close over sidewalk elevator platforms or hoists. It comprises details hinged to the hatchway frame and closable to meet on the central line, a vertical movable elevator platform, guided slidable locking bolts adjacent to the edges of the doors, said bolts having right and left screw threads cut upon their inner ends, a revoluble journaled sleeve or turnbuckle having corresponding threads within which the bolt ends fit. A weighted lever is connected with this and turnable by the rise and fall of the elevator platform so as to withdraw or advance the bolts. A curved bail is fixed to the elevator platform, and when this starts to rise, it contacts with the weighted lever, turns it so as to withdraw the bolts, and the continued upward movement of the bail with the platform separates the doors and opens them when the platform and the bail descend, after the latter has passed below the line of the doors the latter commence closing and finally close as the bail descends still lower and this allows the weighted lever to act to force the bolts into their sockets.

ROCK DRILL.—E. M. Greene and Wm. Brady, San Francisco, Cal. No. 649,602. Dated May 15, 1900. This invention relates to improvements in rock drilling apparatus. It consists of one or more cylinders with pistons and means by which the pistons are connected with the drill so as to move in unison therewith. Explosive vapor is admitted, compressed and ignited in the cylinder or cylinders to impel the drills forward for the stroke, and an independent power mechanism is applied for returning the parts after the stroke has been delivered. In connection with this is a suitable valve mechanism by which the explosive gas is admitted alternately to each of the cylinders so that the first one and then the other acts to impel the piston. The gasoline power drill has great advantages over the present drill. It will do away with engine, boiler and air compressor, as the power will be used directly on the drill. It is expected that it will do as much work as the present power drill does, and it will be placed in the hands of the miner at a price that the miner of small means can reach. The miners using the drill will have the power with them using it directly on the drill, thereby doing away with an engineer, and the cost of the power itself will not be one-twentieth part what the power costs to run the present power drill where wood or coal is used to produce power. The field for such a drill is great, on account of so many miners being unable to purchase the expensive outfit now required. Drawings for a full sized power drill are now in the hands of the builder.

Latest Market Reports.

SAN FRANCISCO, May 24, 1900.

SILVER—Per oz., Troy: London, 27⅝d (standard ounce, 925 fine); New York, bar silver, 60c (1000 fine); San Francisco, 60c; Mexican dollars, 49½c.

Commercial Paragraphs.

J. C. EVENS AND W. J. STENENSON have opened an assay office in Denver, Colo.

AT Victor, Colo., the Economic mill will put in twenty-one Wilfley tables, double-deckers.

ALVIN PHILLIPS & Co. have opened assaying and ore testing works at 1761 Market street, Denver, Colo.

THE Oakland, Cal., Iron Works has bought a lot, 150x100 feet, on which to build an extension of the plant.

THE Water Works Board, Brisbane, Queensland, Australia, are in the market for 165 tons of 4, 6 and 9-inch cast iron water pipe. Bids will be received up to June 30.

R. N. STEWART, representing electrical houses at Denver, Colo., recently furnished sixty Belden alternating current, enclosed arc lamps of 2000 C. P., to the town of Rawlins, Wyo.

THE Truax Manufacturing Co. have been so crowded for floor space that they have been compelled to secure a larger building at No. 69 Stevenson St., San Francisco. The company has lately shipped an order of twenty-six cars to Mexico and twelve large cars to Arizona. A number has also been sent to Alaska. They write: "We have a great number of letters from all over the country which mention the MINING AND SCIENTIFIC PRESS."

UNDER date of the 15th inst., the Edward P. Allis Co. of Milwaukee, Wis., writes: "It does not seem to be generally known among mine owners that the Edward P. Allis Co. of Milwaukee conducts well appointed mining machinery departments in connection with their New York and Chicago offices. We wish you would announce to your readers that users of mining machinery can be served from our New York office, No. 95 Liberty St., and Chicago office, 509 Home Insurance Bldg., with the same efficiency as from the Milwaukee office."

Books Received.

"The Transvaal Trouble" is a booklet by John Hays Hammond, published by the Abbey Press, New York City, and sent for 25 cents. In it Mr. Hammond discusses the South African imbroglio as an American citizen from an American standpoint, and says that England is fighting the Boers for the same principles that the American colonists fought England 120 years ago.

WANTED.

SMOOTH-ON CASTINGS.
TRADE MARK

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

GATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

A Money Maker in Nicaragua.

MURRA GOLD MINING COMPANY, NICARAGUA, C. A.
NICARAGUA, June 20, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

After an experience covering a period of three years with both the first and improved "Tremain Steam Stamp Mill," in every particular I have found it perfection—a money maker, and just the thing for a small capital, while companies organized on a large scale would do well to look into its merits.

I find no difficulty in crushing eight tons of ore per day and running on hard ore This mill should be a winner.

Very truly yours,

[SIGNED] L. W. ADAMS,
General Manager Murra Gold Mining Co.

Eight Years in Operation Without a Cent for Repairs.

GOLDEN P. O., JOSEPHINE CO., COLO., December 23, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

Our Tremain Mill is giving us good results, and although being in operation since 1892 has not cost us $1 for repairs, and to-day is making 80 drops per minute with 95 lbs. steam pressure.

The ore we are working at present is soft and we mill in 24 hours, using No. 10 slot screen, 15 tons.

Yours truly,

M. C. DAVIS,
Superintendent Sarah Belle Mines.

Running Under Compressed Air in West Australia.

293 ST. GEORGE'S TERRACE, PERTH, W. A., February 6, 1900.

F. R. PERROT, ESQ., AGENT OF GATES IRON WORKS, PERTH, WEST AUSTRALIA.

DEAR SIR: In reply to your enquiry as to the working of the Tremain Mill on the Burbanks Grand Junction, I would state that at the start we worked this from the boiler supplied by the Gates Iron Works Company, but owing to certain irregularities of the running, which were in a measure due to the intermittent supply of ore and the short time that we were able to run it per day, I finally laid on air piping from my air compressor, a quarter of a mile distant, and used the boiler as an air receiver, with the result that I got an absolutely constant run, which, I believe, averaged about 105 drops per minute, and this was kept up with great regularity and showed a much better return in the treatment of the ore. The usual air pressure in this case was 80 lbs., whereas under steam we were not so satisfied with the result as worked at 100 lbs. By this we were also saved in cost the charges of stoker, fuel and water, and it was worked with much greater cleanliness, and during the whole time the mill was running—which was several months—it never froze up on us or showed any signs of trouble in that direction.

The mill is now temporarily stopped, but when it is again started I shall most decidedly continue the use of compressed air.

Yours faithfully,

[SIGNED] GEO. HEWER.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

Contracting Engineers and Millwrights,

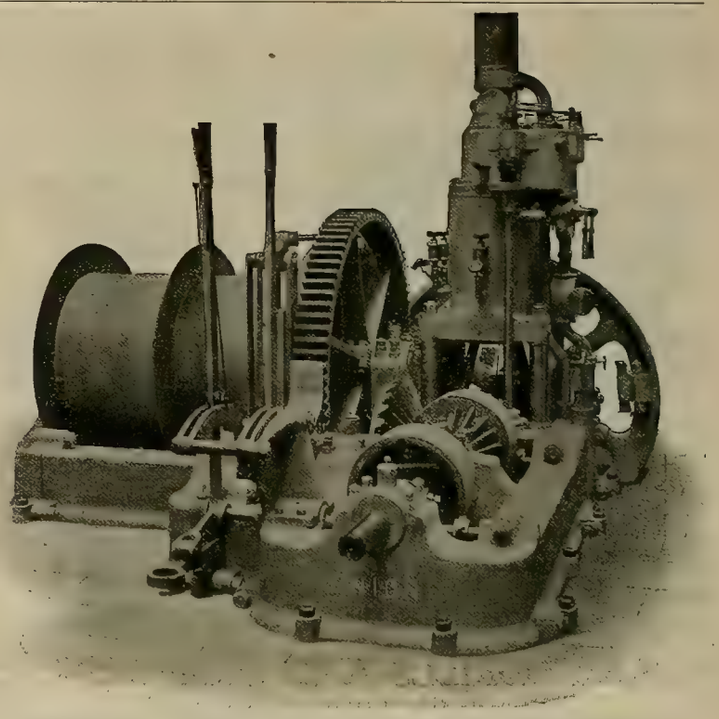
OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.



One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office, 244 First Street. Works, Corner First and Clementina Streets. SAN FRANCISCO, CAL.

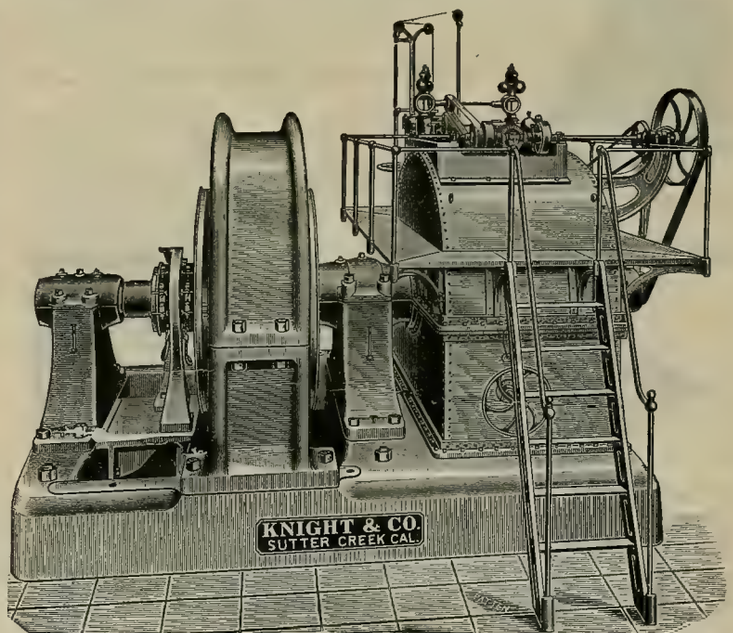
THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.



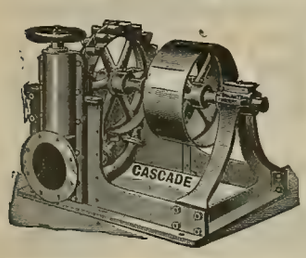
ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

KNIGHT'S WATER WHEEL.



The accompanying cut shows the general arrangement of **The Knight Water Wheel**, direc-coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing.
These wheels are designed for **100 to 2500 H. P. Highest efficiency and regulation guaranteed.**
WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING.
Wheels for mill and reversible hoisting works a specialty.

KNIGHT & CO., Sutter Creek, Cal.

CAPE NOME
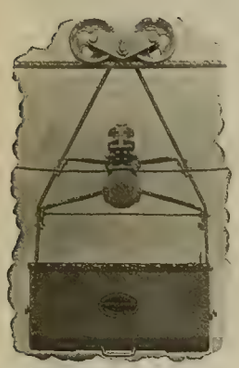
Send for our Catalogue describing the
PNEUMATIC PROSPECTOR.

SIZE, 6x 11x 14 Inches.

WEIGHT, ONLY TEN POUNDS.

—AND THE—
PNEUMATIC SEPARATOR.
Weight, 160 lbs.; capacity, 15 to 30 tons per day.



These machines save the gold WITHOUT THE USE OF WATER, enabling the miner to thoroughly prospect on the spot and successfully work the rich benches and gulches, when water is not convenient. The separation is accomplished by graduated air current. These machines are especially adapted for saving flour and beach gold. No quicksilver being used, the iron-coated beach gold of Cape Nome, so difficult to amalgamate, is saved with these machines as easily as though the gold was clean. Send for descriptive circulars.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

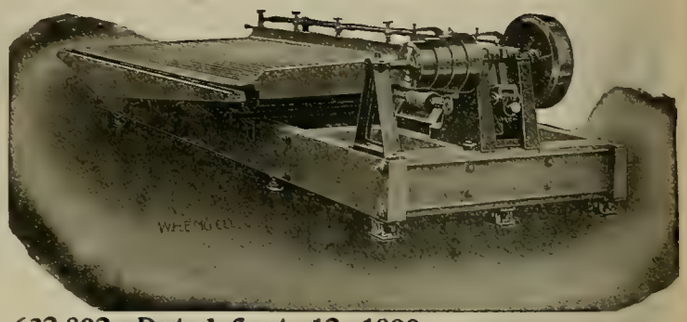
Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, mroe or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.



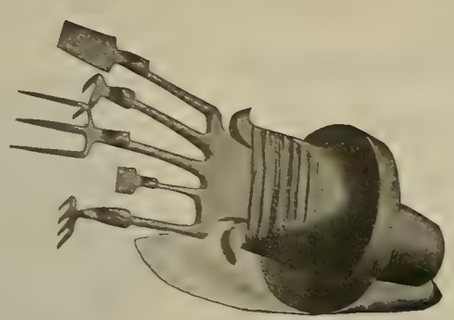
(SEE PAGE 597.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 92 pages, 8vo; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.*

First Class Practical and Scientific Books.

BRANNT.—A Practical Treatise on Animal and Vegetable Fats and Oils; comprising both Fixed and Volatile Oils, their Physical and Chemical Properties and Uses. The manner of Extracting and Refining them, and Practical Rules for Testing them, as well as the Manufacture of Artificial Butter, Lubricants, including Mineral Lubricating Oils, etc., and on Ozokerite. Edited from the German and other sources by W. T. Brannt. 240 engravings, 730 pages, 8vo. Price.....**$7 50**

BRANNT.—A Practical Treatise on the Manufacture of Soap and Candles; comprising the Chemistry, the Raw Materials, the Machinery and Utensils, and Various Processes of Manufacture, including a great variety of formulæ. Edited chiefly from the German by W. T. Brannt. 163 engravings, 477 pages, 8vo. Price.....**$7.50**

BRANNT.—Petroleum; Its History, Origin, Occurrence, Production, Physical and Chemical Constitution, Technology, Examination and Uses; together with the Occurrence and Uses of Natural Gas. Edited chiefly from the German of Prof. Hans Hoefer and Dr. Alexander Veith, by William T. Brannt. Illustrated by 3 plates and 284 engravings, 738 pages, 8vo. Price.....**$7.50**

BRANNT.—The Practical Scourer and Garment Dyer. Comprising Dry or Chemical Cleaning; the Art of Removing Stains; Fine Washing, Bleaching and Dyeing of Straw Hats, Gloves and Feathers of all kinds; Dyeing of Worn Clothes of all Fabrics, including Mixed Goods, by One Dip, and the Manufacture of Soaps and Fluids for Cleansing Purposes. Edited by William T. Brannt, Editor of "The Techno-Chemical Receipt Book." Illustrated. 200 pages, 12mo. Price.....**$2 00**

DEITE.—A Practical Treatise on the Manufacture of Perfumery. Comprising Directions for Making all kinds of Perfumes, Sachet Powders, Fumigating Materials, Dentifrices, Cosmetics, etc., etc.; with a full account of the Volatile Oils, Balsams, Resins, and other Natural and Artificial Perfume Substances, including the Manufacture of Fruit Ethers, and Tests of their Purity. By Dr. C. Deite, assisted by L. Borchert, F. Eichbaum, E. Kugler, H. Toepfner, and other Experts. From the German by William T. Brannt. 28 engravings. 12mo, 358 pages. Price.....**$3.00**

LEHNER.—The Manufacture of Ink. Comprising the Raw Materials, and the Preparation of Writing, Copying and Hectograph Inks, Safety Inks, Ink Extracts and Powders, Colored Inks, Solid Inks Lithographic Inks and Crayons, Printing Ink, Ink or Aniline Pencils, Marking Inks, Ink Specialties, Sympathetic Inks, Stamp and Stencil Inks, Wash Blue, etc., etc. From the German of Sigmund Lehner, Chemist and Manufacturer, by William T. Brannt. 12mo, 230 pages. Price.....**$2 50**

RICHARDS.—Aluminum; Its History, Occurrence, Properties, Metallurgy and Applications, including Its Alloys. By Joseph W. Richards, A.C., Ph.D., Instructor in Metallurgy at the Lehigh University. Third edition, revised and enlarged. Illustrated by 44 engravings and two diagrams. In one volume, 8vo, cloth, 702 pages. Price.....**$6.00**

ASSESSMENT NOTICES.

MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of April, 1900, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of June, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 25th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of May, 1900, an assessment (No. 5) of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 11th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

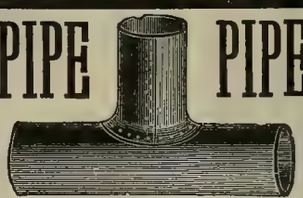
By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—213 Jackson street, San Francisco, Cal.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 23) levied on the 2nd day of April, 1900, the several amounts set opposite the names of the respective shareholders, as follows:



Name.	No. Cert.	No. Shares.	Amt.
H. Heckmann, Trustee.....	64	2,000	$40 00
H. Heckmann, Trustee.....	65	2,000	40 00
H. Heckmann, Trustee.....	66	500	10 00
H. Heckmann, Trustee.....	67	500	10 00

Lacy Manufacturing Co.,

LOS ANGELES.

THE LITTLE ALASKA GOLD WASHER.

Price $6. Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General Arrangement of Pelatan-Clerici Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

No. 2080.—VOLUME LXXX. Number 22. SAN FRANCISCO, SATURDAY, JUNE 2, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Telluride, Colorado, District.

The Telluride mining district, in the San Juan mountains, southwest Colorado, is a mountainous region characterized by precipitous topography. The mountains rise to 14,000 feet from a plateau of 7000 feet, which bounds the region on the west. The rocks are nearly flat-bedded sedimentaries of Triassic, Jurassic and Cretaceous age, overlain in the eastern part of the quadrangle unconformably by a heavily bedded conglomerate, 200 feet thick, above which lie 2000 feet of andesitic breccias, in part waterlaid, and still higher 1000 feet of volcanic flows, andesite and rhyolite. Diorite stocks of large dimensions have cut all the other rocks of the region and are most recent in age. Surface denudation has exposed them to view. The centers of volcanic activity lie to the east of the sheet. Several well-defined fissure systems, due to the action of extraneous forces, penetrate the rocks of the region. The rocks are characterized by the alternation of widely and narrowly spaced zones of fissures. The zones of narrowly spaced fissures vary from 1 to 10 feet in width, and it is along these that the workable veins are found. Relative movement of the walls of the closely fissured zones, accompanied by trituration of the included rock, developed open space which the ore now occupies. The veins carry gold, mostly free, but in part combined with metallic sulphides, silver mostly in galena and freibergite, less frequently as stephanite, pyrargyrite, polybasite, etc. Beside iron, lead, copper and zinc sulphides, there occur as gangue, predominating quartz, carbonates, barite, fluorite, sericite and other minerals in small amount. Gold and silver veins occur closely associated. Accompanying the veins the wall rocks are altered, and impregnated with iron pyrite, occasionally auriferous. The values vary between wide limits. They must be given in more detail than is possible here. The veins show remarkable continuity in length, one having been profitably worked for a distance of more than two miles. The ore is of Tertiary age, is of deep-seated origin, and has been deposited from solutions; $20,000,000 is a low estimate for the product of the district. It has steadily increased in importance since 1875, and very rapidly within the last few years. Formerly silver was the principal product; now much the larger output is in gold. The three accompanying cuts from the Telluride Journal are typical of the topography of the district. The Bessie cyanide mill in Turkey creek, or Alta basin, is connected with the Bessie mine by an aerial ropeway. It is over 300 feet in length, 60 feet wide, and has a daily capacity of 200 tons. Near it is the 40-stamp mill of the Gold King, one of the steady producing concerns that pays its owners dividends and adds its annual mite to swell the great aggregate gold yield of the State. On page 612 is portrayed the Klondike mine, at Ophir, on the opposite slope of Silver mountain.

The Bessie Cyanide Mill, Telluride, Colo.

Direct Connected Jet Condenser.

There was lately installed at the U. S. Gov't. Yard, Bremerton, Washington, an electric plant, one of the units of the plant being a special Smith-Vaile direct connected, electrically operated jet condenser, as illustrated by half-tone herewith. A sub-base is provided extending under the air cylinder as well as condensing chamber, and also extended to receive a G. E. motor. The power end is provided with double reduction of gears; the motor is provided with rawhide pinion, and there is also a rawhide pinion on pinion shaft of condenser. The gears are machine cut; air cylinders removable and brass lined; air piston is of bronze, fibrous packed and provided with expansion ring; special priming valve is also provided, and the condensing chamber is provided with special distributing valve. The manufacturers, the Stilwell-Bierce & Smith-Vaile Co. of Dayton, O., will be very glad to give further particulars regarding this machine. This firm also build jet and surface condensers.

About Advertising.

Inquiry from the business office elicits the information that the number of the last advertising contract made with this paper, on the completion last week of its 40th year of publication, was No. 17,846, by the Geo. E. Dow Pumping Engine Co., of San Francisco, to expire June 1, 1901. To make and satisfactorily fill so many thousands of advertising contracts implies a little knowledge of advertising, and a few remarks on that subject are in order.

Vast amounts of money are annually paid publishers by dealers in and makers of machinery; some of the many who pay out money for space in public journals do not make proper use of their opportunities. To buy a certain amount of space is not enough. Advertising is costly; rightly used it is a profitable investment for the advertiser; wrongly used it is a great expense. The form and style of the advertisement should be occasionally changed; that gives a freshness and added value to the announcement. In such a paper as this, with a circulation all over the west half of America, weekly scanned by so many thousands of men in the mining industry, the advertising pages are read with as much care and scrutiny as any other part of the paper. Those pages constitute a directory of the leaders in every line of business connected with mining and metallurgy, and the announcements therein require change to be of fullest value to the men who pay for them, and, incidentally, to the paper, for if an advertisement does not pay it is not renewed, nor the contract continued, and however much the paper may try to secure and hold deserved popularity and thus make its advertising columns of value, its best efforts in this regard are not fairly supplemented by an advertiser who lets his advertisement appear week after week in the same old stereotyped form without changing it.

Advertising is essentially a co-operative matter. When a reputable paper contracts for a certain amount to publish an advertisement for a certain time, it tacitly agrees to vigilantly maintain and extend its circulation, to use all means to make the paper worth advertising in, and to thus serve the advertiser in his business. This the advertiser has a right to expect. For this he pays his money, and a paper that is sleepy or indifferent to his interests is just the same as any other employe in his business, deserving of dismissal. But on his part the paying of money for such active service is not enough: he owes a duty to himself to see that the advertising space is made pay, and, indirectly, a duty to the paper to aid it in its efforts in the same direction. This he can aid and co-operate in by such suggested changes. It is the policy of a live paper to make no charge for such changes, desiring to aid in making the advertisement of the fullest possible value.

One-time insertions seldom pay. The publisher knows this as well as does the advertiser who has learned it by sad experience. He should impress this fact on the advertisers from whom he takes business, though there are few periodicals strong enough to resist the temptation to take everything offered them without regard to the advertiser's best interests. The advertiser who has tested it knows that it usually takes several insertions of an advertisement to arouse the interest of the readers of a periodical. It is continuous advertising that pays. It takes time to form the acquaintance of readers. No prospective buyer is going to jump at a new proposition. He wants to know further, to see the announcement steadily and make inquiry before he parts with his money. Nor does it pay to just put in an advertisement and expect it to do all the work. Some months ago an advertiser wrote saying, "I do not think my advertisement pays. True, I get lots of inquiries, but I don't seem to increase my sales." If the advertisement elicited "lots of inquiries," it fulfilled its mission. That was what the advertisement was for; if he was too careless or unbusinesslike to follow up those inquiries, that was not the paper's fault. It brought him the inquiries; it was for him to do the rest.

Much money is fooled away in supposed advertising: "souvenirs," "special editions," "programmes,"—personal publications started to gratify personal ambition—are among the things in which advertisers yearly waste considerable money. Sympathy, inability to say "No," personal friendship, a desire to "see his name in print," or to "help the fellow along," sometimes influence a man to pay out good money, but he should charge that to charity, and not to his advertising account. As a business proposition, the only thing for makers and sellers of mechanical devices to advertise in is a high-class journal with good circulation among those from whom one has a right to expect customers. This is now well understood east of the Rockies. East of Denver a manufacturer or dealer would now laugh at any one soliciting an advertisement for anything but an established journal of wide circulation. It takes effort, unwearied vigilance and the expenditure of a great deal of money to build up a circulation that justifies a journal in taking money for announcements in its advertising columns, and even in this regard the fact that a publication was a good medium last year, or the year before, does not indicate that it is a good medium to-day. In the advertising field, as in all other fields, conditions are constantly changing. It is because advertisers do not generally recognize this fact that publications which were excellent media in the past, but are far from being so at present, find themselves able to secure an amount of advertising patronage out of all proportion to the value they give in return.

To those who understand these things advertising has ceased to be an experiment, or "an expense," and is assuming the exactitude and certainty of a science, with as tangible and definite a result as a mathematical calculation. Anything that sells goods is good advertising; it is not what it costs, but what it produces, that determines the value of an advertisement. If a $5 advertisement produces no result, it is $5 thrown away, no matter if it bought a page of space for a year; if a $500 advertisement sells $20,000 worth, it is a good advertisement. Advertising is simply the art of securing public notice, procuring prominence, obtaining attention of buyers. There are men in business who won't advertise; think it unnecessary; they have a right to such belief and are to be respected. That they are mistaken bears harder on themselves than on any one else. There are men who want to advertise, but don't know how; they are the prey of the man who proffers "cheap" advertising; who has only one price, and that is whatever he is offered. Some of those advertisers outgrow such folly and put the same business principles into practice in buying their advertising that they do in buying anything else, realizing that a good article always costs more than its inferior competitor, and is worth infinitely more.

There is a good deal in the wording and arrangement of the advertisement. The space costs just as much, no matter how it is filled, and, to get the full value out of it, what is said and how it is placed ought to have more attention than it ordinarily gets from advertisers in trade papers or technical journals. A picture of the machine or device for sale, with a brief reference thereto is always a good advertisement. What is fast becoming a favorite method with live advertisers is to have "a series": from six to twenty different advertisements, to rotate.

Some advertisers make the mistake of trying to put three gallons of syrup into a two-gallon jug. If they have six inches space they furnish material enough to require eight inches for proper display. How to attract requisite attention is the problem, and usually best solved by using some striking features, one of the best of which is bold type, attracting public notice, displayed in sufficient space to compel the attention of the reader.

A good way in preparing an advertisement is to look at the whole matter from the standpoint of the buyer. The man who makes or sells the machine knows so much about it that he often forgets that the man to whom he wants to sell doesn't know one-tenth as much about its details, and in making up his advertisement he ignores this fact and omits the very points that would be of interest to a probable customer. He can supplement this by the production of a good catalogue, which is an admirable adjunct to a good advertisement in the right kind of a paper, but a little information in the advertisement itself is always well.

It is never good business to exaggerate. The simplicity of truthfulness is best. The statement of the exact fact in a business announcement is of more mutual satisfaction. There is tremendous competition. About everything that is made must have something to recommend it above competing articles of the same kind; it must have some improvement, or be stronger or faster or do its work better, or cost less money, or something. Otherwise, it has no excuse for living. It is that way with a technical paper or a rock drill, an ore concentrator, a book, or anything else that depends on quality for its support. The way to sell the article is to tell what it is, what it does, and say briefly, clearly, convincingly why it should be bought in preference to anything else. Simply to say that the machine is the best is no use: any one can say that. It has been said over and over again. The assertion is a good one if it can be backed up—if it can be shown why. Of course, reputation goes a long way. There are men and firms advertising in this paper who have deserved reputations of long standing for making good goods at fair prices. They have enviable records and justly point to pleased customers all over, and are able to print good testimonials from satisfied patrons, which is always a good way of advertising. But it is a mistake to depend entirely upon long-established reputation or unblemished record of fair dealing. For instance, were this paper to depend in its business on its present lists of subscribers for a few years it would ultimately find its number of readers diminishing, for men die, or forget, or take up other publications. It is only by paying competent men to go all over California, Oregon, Idaho, Montana, Utah, Colorado and Arizona, and get subscribers, and by furnishing a valuable paper, that its lists can be held up. In this and by advertising it gets new subscribers—it advertises, too. Last year this paper sent out 224 different advertisements to as many different publications. We take our own medicine and practice what we preach. No institution, no matter how well known or well liked, can get along without pushing its business and advertising. Every business must keep young, must hustle and push and be enthusiastic, or fall behind and die of dry rot. So those old, dignified concerns that "really don't need to advertise; we are so well known, you know," are mistaken. There are many competitors in every field of business, and these competitors are building up their business by advertising and hard work. They have good goods, too, and mean to make it known and pound the fact into the public attention. These youngsters take advantage of up-to-date

methods of publicity (of which advertising is the most important), and will in time get the business away from old-established concerns that think they do not need to advertise, but can keep on going because of former momentum.

The trade or technical journal is the best medium to use for mechanical advertising; an advertisment in a general newspaper is like a shotgun: it scatters. Not one in a thousand is likely to be a customer. An advertisement before the men most likely to be customers is a rifle ball.

The purpose of all advertising is to sell goods—not "to help the paper along," or because one's competitor advertises, or just to make a showing, but to secure new customers and retain old ones, and whenever an advertiser finds or thinks that his advertisement is not paying him, or is failing to bring satisfactory results, he should discontinue it and try something else. Advertising space costs too much to fool money away on unprofitable mediums.

There are men who have made advertising the study of their lives; they often profit from the costly experience of others, and yet there is no great mystery about it. It consists in having something worth advertising, and then using the right kind of a medium to insure the greatest possible amount of publicity at the least possible outlay. All the medium can do is to go to its subscribers and tell the advertiser's story. The more people that read it the more valuable it is, if they are the kind of people likely to be customers. If the advertiser wisely chooses his medium and rightly uses his space he should get good returns. In every advertisement there should be some inducement to get people to write to the advertiser; the main thing is to get into personal communication with people. When an answer is received it is not well to merely send a catalogue or some printed matter or just acknowledge the letter, and let it go at that. When a man is sufficiently interested to write he should be given respectful attention. He should be written to and followed up, and kept after long enough and hard enough to eventually sell him what he wants.

Everything about an advertisement needs to be studied. What is said, how it is said, and the way it appears, is important. Some advertisers thoroughly realize the value of individuality. In the past two years this paper has paid over $400 for the different kinds of special type demanded by one particular advertiser who wants his announcements set just so and in the special type that he thinks is the right kind for his display. This is simply instanced as an illustration of how particular some advertisers are and how a journal spends money to please a particular customer. Advertising is an art; like anything else, nowadays, it takes brains to make it pay; it is recognized as a necessity by the brightest business men everywhere. It is cumulative in its effects and values. Were a man to advertise for a short time and then withdraw his announcement, he would derive little value from it; upon its continuance depends much of its value to him. In an advertisement to appear for, say, a year, the last six months is usually worth five times as much to him as the first six months. This is what is meant by the "cumulative" value of an advertisement.

The whole thing is simply a question of pushing one's self to the front, or of being pushed to the rear. The world has advanced, and, if a man wants to be in business, he must advertise or expect to be relegated to the musty oblivion of things that were. Time was when no one advertised, so it was unnecessary for any one to do it; but in this sunset year of the nineteenth century every one who is not in business solely for his health has to keep up with the procession.

If any one, on reading the above, imagines that it is written as a plea or solicitation for advertising, the writer has failed to make his meaning plain. This paper annually rejects considerable proffered advertising, and never has any difficulty in keeping its columns full. What is here said is intended to serve as a few practical points on a subject of great interest to a great many, yet one on which little has been written. The fact recited at the beginning that the last advertising contract received by this paper, on the close of its fortieth year, was No. 17,846, led to a train of thought in which some of the other 17,845 figured, and the above is the result.

Concentrates.

THERE is no late issue of the mining laws of California of any practical worth.

THERE is excellent slate in El Dorado county, Cal., but the demand is exceedingly limited.

WHITE LEAD ought to be a good lubricant for a hot crank pin, mixed in the proportion of one part lead to nine parts valve oil.

A. E. OUTERBRIDGE is authority for the statement that the clay underlying the City of Philadelphia, Pa., contains 3 cents in gold in every cubic foot.

THERE is not now, there has not been, nor is there likely to be any "plague" in San Francisco, bubonic or otherwise, beyond the ever present plague of pestilent politics.

FUSED sulphate of ammonia or alkaline halids have little effect upon platinum, but a mixture of ammonium sulphate and bromide, or potassium bromide, corrodes the metal rapidly.

THE only quicksilver mines in Russia are at Nikitowka, Bachnut district, Ekaterinoslav. The average yield of the ore is about ¼ of 1%; about 300,000 kilograms are annually produced.

FIBROUS TALC is used by paper makers, its value depending upon its fibrous structure. It is likewise used in the manufacture of dynamite, as an absorbent and conveyor of the nitro-glycerine.

ENTROPY or heat weight is that property of a body which remains unchanged so long as no addition or subtraction of heat is made from without. It is a property of the heat in the body, or heat energy.

"CHEMICAL LEAD" is a soft, pure lead, free from any other metal, used mostly for lining acid tanks. "Chemically pure lead" is a laboratory product, occasionally used for assay purposes, but not in general use.

FRENCH and Belgian burr stones consist of small particles of silica mixed with calcareous material. They are hard and porous. The German burr is of basaltic lava and the American burr is a quartz conglomerate.

IODOFORM is an organic compound similar in constitution to chloroform, but containing iodine in place of chlorine, and on this account is a solid at normal temperature. It is susceptible of electrolytic production from alcohol.

AT the chlorination plant of the Utica mine, Cal., the iron sulphate is made on the premises from scrap iron, sulphuric acid and water. Each tub of ore leached takes fifteen pounds sulphuric acid. A drum of liquid chlorine should treat about fifty tons concentrates.

IN mining management, as in other things, the cheapest man is he who knows how to succeed, and the most costly man to the members of a co-operative enterprise is the man who fails, and this would still be true though not a cent were paid him for his services.

THERE is an inevitable and unavoidable loss of gold and zinc in smelting cyanide slimes, though where the latter are well oxidized and properly fluxed the loss of zinc is reduced to the minimum; for nearly all the zinc goes into the slag except what is reduced in the smelting which partly enters the bullion and partly escapes as fume.

PURE chromium and tungsten may be manufactured in commercial quantities. The method is to take a carbon pipe filled with the metallic oxide mixed with carbon, inclining it and subjecting it to an electric current; the metal contaminated with carbon readily flows off as a result of the reaction. The chromium carbides are purified by remelting with lime.

THE value of a mining property is too elusive a subject to be disposed of in a "Concentrate." Ore in sight, less cost of extraction, is one element of value; its prospective value—what may exist, but is not "in sight." Its prospective value can not be fairly judged or even favorably considered because of its proximity to some going mine. Indeed, the very fact of its contiguity to a big paying property may be an argument against the prospect having any value at all.

LABORATORY experiments or metallurgical processes on a small scale are of the utmost value in indicating possibilities of commercial practice on a large scale. While the workings of a large plant is often entirely different from that of a very small one, yet it is fair to infer that a successful test on a small scale is presumptive evidence of attendant success on a larger scale commensurate with the magnitude of the interests involved, if the same degree of accuracy throughout be attainable in the latter case.

THE only properties necessary in moulding sand are silica and alumina. The presence of lime, magnesia, metallic oxide, etc., are detrimental. It is practically impossible to get sand with just the proper amount of silica and alumina in combination. To remedy this trouble, the best way is to make the mixture oneself. To do this in a practical way, get pure silica, or nearly so as possible; (it can be had up to 95% pure) and mix with a strong sand containing at least 60% to 70% alumina. It is impossible to give the exact proportions it would require in each case owing to the variation in the sands that are found in different parts. Theoretically, the proper proportion of silica is 90% to 10% alumina, but these proportions are, in the every-day hurry and push of the modern foundry, very difficult to keep up, as the clay in the strong fine sand vitrifies and adheres to the castings each day, so that the proportions would be changed after each heat. From 33% to 40% of silica with such sand as specified gives the best results, making castings with a smooth surface and sharp lines, and also enabling the foundryman to largely dispense with the use of foundry facings.

THE Crecelius process of casting aluminum is in use in St. Louis, Mo. It consists in using an iron mould with ascensional feed. The melting point of aluminum is 1300°, before casting the moulds are heated to about 1500°. The mould has a gate at the top into which metal is poured, and which follows up the shrinkage of the casting. The mould and its contents are then placed in a cooling chamber, through which compressed air is driven, rapidly reducing the temperature. The advantage claimed, apart from the greater decorative effect, is that, with one-third the weight, they are equal in strength to brass. As compared with steel, weight for weight, they are stated to be 10% stronger.

WATER HAMMER in pipes is caused by the surging of the water in partially filled steam or water pipes. In steam or return pipes in heating apparatus, air or steam may be lodged in places along horizontal pipes, separating portions of water, which, by the natural condition of moving water, produces wave motion and impact upon the inner surface of the pipe. In water pipes the presence of air in horizontal pipes produces the same action as in heating pipes. The absence of air in the water pipes of a house near the faucets causes water ram by the sudden closing of a faucet, due to the arrest of the momentum in the long column of water in motion. The air chambers in plumbing work act as a cushion.

AS FAR as the granite has been penetrated downward, no other rock has been found yet to underlie, and, therefore, the granite is still considered to be of igneous origin. The greater portion of the earth's crust accessible to human observation consists of rocks deposited by the agency of water, and, for this reason, rocks are sometimes classed as stratified and unstratified. The igneous rocks all belong to the unstratified class, for the stratified rocks have been laid down by the agency of water, and they are all alike in character, that is, they all consist of sand or lime, or shale, deposited in layers or laminæ. In proof of this, if a stratum of sandstone be cut across the planes of its bedding, its laminæ or thin layers are distinctly seen, and when a stratum of limestone is seen resting on a stratum of sandstone, the correct idea of the application of the term can be realized, for the stratum of limestone is distinctly different from the stratum of sandstone.

WHERE in the use of the cyanide process the percentage of extraction falls from 80% to 35%, it is likely that such result is due to an accumulation of products of decomposition of sulphides and cyanide. With every new operation a fresh quantity of sulphide of potassium was formed, which, being a precipitant for silver and gold, gradually prevented their solution by cyanide. Soluble lead or zinc salts could be used in such instances to remove the sulphur from the working solutions by causing it to form as insoluble metallic sulphides. The effects of roasting sulphides are, first, an alteration of obnoxious compounds into indifferent ones; second, the removal of sulphur, by which the ore grains become porous, and with it the fine gold and silver particles become accessible to solvents; and, third, a certain amount of fritting of the fine ore grains which follows more rapid leaching afterward. Where the ore is not roasted "dead," the effects will necessarily be different. The last named point would be the same; but, instead of insoluble oxides, there would be a mixture of sulphates and oxides as well as undecomposed sulphides; consequently, also, a less porous product. If all sulphides could be transformed into sulphates at the same time, little could be said against adopting such a method preparatory to cyanidation.

IN estimating sulphur in pyrites, to obviate the inconvenience attending the presence of ferric salts in the solution from which sulphuric acid is to be precipitated by barium chloride, the ferric salt may be reduced to ferrous, and at the same time destroying traces of nitric acid by boiling the acid solution with a sufficiency of sodium hypophosphite. This method gives results about ½% higher than are obtained by precipitating in the presence of ferric chloride; besides the method occupies less time and a smaller quantity of solution is used. In carrying out the process, 1 grain of pyrites is weighed into a flask, 25 c. c. nitric acid added and allowed to stand for a quarter of an hour without external heat; then 1½ grains of potassium chlorate is dropped in and the assay warmed for a quarter of an hour, then boiled down to dryness on a hot plate, the flask being inclined to avoid loss by splutterings; 20 c. c. of hydrochloric acid are next added and half boiled off, 50 c. c. water added and the assay filtered from insoluble matter. The filtrate and washings are made up to about 200 c. c. and then 1½ grains of sodium hypophosphite added; the assay is heated to boiling when it quickly loses all yellow color. A slight excess of barium chloride solution is then added and the assay allowed to stand for three hours, when, if the supernatant liquor be clear it may be filtered. The liquor is decanted onto the filter, and 1 c. c. hydrochloric acid dropped on the precipitate in the flask, followed by 100 c. c. of boiling water. After five minutes this also is poured on the filter, and the washing continued as usual. The filtrate and washings amount to 400-500 c. c. Duplicate assays usually agree to less than 0.2 in about 50%. Blank assays show that 0.01 to 0.02 grain of barium sulphate is to be deducted on this account.

Horses and Breccia.

Written for the MINING AND SCIENTIFIC PRESS by J. P. WALLACE.

Large isolated masses of country rock when enclosed in a vein and wholly or partly surrounded by ore are called horses. Horses result in many cases from an irregular fracturing of the country along the line of fissuring, whereby large angular masses are torn from either wall. The walls in many fissures are often very irregular and cracked. Mineralized solutions at a later period find their way into these cracks and enlarge them by dissolving out certain rock constituents, and in their stead depositing metallic and earthy minerals called ores. As a result of this process of replacement, the barren rock mass is completely detached from its resting place, is included within the vein and becomes a horse. Sometimes instead of a single fissure there are two nearly parallel fissures formed within a few feet or yards of each other, and these continue for varying distances and then come together to form but one crevice; a large sheet or slab of country rock is thus enclosed by the fissures, and, when the latter are subsequently filled with ore, the slab becomes in mining parlance a horse. In other cases the fissure is split up for a short distance into several arms, and these surround different horses of ground. The presence of horses in a vein may occasionally be accounted for by loose boulders rolling into a fissure from the surface; but such occurrences are probably rare, because the great majority of vein crevices were originally narrow cracks, and not gapping fissures. Veins which have been much faulted commonly enclose horses. Horses are often met with at the junction of so-called "cross courses" or "crossings" with a true vein, the country at such intersections being usually much broken. Horses of country rock are not confined to fissure veins; they occur in gash veins, bedded veins and contact deposits. Ore deposits in limestone furnish many examples of horses surrounded by ore.

Horses differ much in size and shape; they may be several hundred or only a few feet in length and of almost any shape; the width may be sufficient to almost block up the vein, or it may split the vein into two or more branches, the latter surrounding the barren block and again uniting beyond it. Several horses but little removed from each other also produce irregularities in the ore body. A single horse is sometimes divided by numerous ore seams, which traverse it in many directions, and not unfrequently the whole body is transformed into a mass of ore.

The fact that a vein is horse-ridden does not militate against its true fissure character nor its ore-bearing qualities, but the presence of horses often adds to the expense of development and occasions great inconvenience. Many such veins are excellent ore producers, and, although often lacking the old orthodox requirements of a true fissure, namely, well defined, smooth, corrugated and slickensided cheeks, they are nevertheless true veins.

Breccia in veins is a cemented mass of numerous, small, angular rock fragments. Horses and breccia are to be distinguished; a horse is a single large body and breccia is an aggregation of many small fragments. Either may occur in a vein without the other or both may be associated in the same vein. Breccia occurs mostly in veins bounded by hard, brittle rocks which have been subjected to violent shocks or explosive forces. Fissures resulting from such forces generally have shattered and imperfect walls, with much loose material between them. Subsequent movements of one wall against the other crush this material into innumerable pieces, and these are gathered into expanded portions of the vein, commonly known as shoots, which extend downwards at varying angles to different depths. Although vein breccia may occur independent of displacements, its presence is generally indicative of movement; but the amount of brecciation is not always in proportion to the amount of movement. When the fragments are loosely adherent, having many open spaces between them, ample room is afforded for the entrance of hot mineral-bearing waters. These slowly percolate through the mass, and, by an interchange of elements between the waters and rock fragments, the latter becomes more or less mineralized and the open spaces filled with quartz and metallic minerals. All breccias are not ore bearing; when made up of unusually small pieces of ground-up material, the mass packs very closely and chokes the openings, so that no passages are left for the mineralized waters. Such places in a vein are consequently barren of ore. The same vein may yield in one shoot barren, and in another shoot productive breccias, while other brecciated veins may be wholly unmineralized. As a rule, brecciation is conducive to ore deposition. Veins of this character are of frequent occurrence, and are generally looked upon with favor. Veins which have once been filled, but not with breccia, are at a later period occasionally rent asunder and their contents reduced by fault movements to a brecciated condition. Breccia thus formed may be simple or complex, that is, made from a single gangue stone, such as quartz, or new and different material furnished by the last movement may be mingled with that already present.

Brecciated ore deposits occur sometimes in the form of isolated chimneys or upright zones of crushed country rock. Brecciation is made possible in such cases by the occurrence of a network of short, cross-fracture lines, limited in diameter anywhere from 10 to 50 or 100 feet, but extending vertically to considerable depth. Gouge matter and striations are present in some instances, and these suggest prior movements within the mass. Generally ore zones of this kind are directly or indirectly associated with an interrupted line of fissuring, which is often a narrow crack choked with finely ground material, and, therefore, practically closed. Only at the point of cross-fracturing could the mineralized solutions find a ready passage to the surface.

Horizontal or slightly inclined brecciated ore deposits occur also. In Eagle county, Colo., an iron-stained quartzite breccia occurs in a sharply defined contact between a lower bed of gray, soft quartzite and an upper bed of white, massive quartzite. Continuous shoots of high-grade gold ore are found at intervals in the brecciated zone.

Mining on the California Gold Belt.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS, Assistant State Examiner of Mines.

Owing to the extremely complicated structural geology of the California gold belt, positive assertions as to the relative age of the eruptive rocks which so commonly occur throughout its length are unsafe; but in a general way it may be safely stated that upon rocks of an uncertain but very great age, possibly Archæan, there was laid down in Palæozoic time a deep series of sediments, consisting of mud, sandstone, limestone, etc. It appears that there was then a period of volcanic activity, during which were accumulated a vast quantity of basic rocks, chiefly diorite, diabase and basic tuffs, breccias and conglomerates. Upon this in Jurassic age was spread a deposit of mud of variable thickness, in some sections reaching a depth of several hundred feet. These sediments have been subsequently uplifted, folded and crushed and the upturned edges eroded over a very wide area. The rocks of the Palæozoic age are found developed to a great extent in Calaveras county and have been named by the United States Geological Survey the Calaveras formation. The later deposits of Jurassic time, owing to their extent in Mariposa county, have been named the Mariposa beds. It is in more or less close association with these latter that the so-called Mother Lode of California occurs. To the eastward of these formations is found a broad expanse of intrusive rock, which, owing to its peculiar mineralogical character, has been properly named granodiorite. At numerous points along the contact of the grano-diorite with the formations heretofore mentioned appears abundant evidence that the granodiorite was intruded later than the greenstones and probably also later than the Mariposa beds. The Mariposa beds appear to usually occupy a position along the axis of a great synclinal fold. The Calaveras formation is found both to the eastward and the westward of the Mariposa beds.

The tremendous compressive stress to which these rocks have been subjected since their uplift has resulted in the formation of a series of highly crystalline metamorphic rocks, the mud being altered into slates, the sandstone changed into quartzite, and frequently the limestones are found altered to marble. The greenstones have likewise been changed over broad areas to a schistose or slaty rock known as amphibolite schist. The pressure and movement accompanying it has resulted in many cases in a complete obliteration of the character of the normal rocks, and in place of the highly crystalline granular greenstones we find schists and slates. Throughout the entire gold belt are found greenstones of greatly varying texture—chiefly diabase—which have suffered little or no alteration. These masses of greenstone are from a few feet to several thousand feet in width, and it seems not improbable that they have been intruded since the folding of the sedimentary beds and the formation of the amphibolite schists.

In some of the mine workings of the gold belt these dyke rocks may be clearly seen to be more recent than the inclosing rocks, and not infrequently they are later than the formation of the quartz veins.

Throughout the entire length of the axis of this great synclinal trough is found the gold-bearing veins which constitute the so-called Mother Lode. It seems unfortunate that the name was ever given to this portion of the gold belt, as it conveys an impression to the minds of those unacquainted with the geological structure and veins of the region—that of a continuous, unbroken vein. That such a condition does not exist is well known to those familiar with these mines. There are, through that portion of the State occupied by the counties extending from Mariposa on the south to the southern portion of El Dorado county on the north, at least four distinctly recognizable gold belts. That which skirts the low foothills along the great central valley includes the copper mines found near Copperopolis and Campo Seco, in Calaveras county, and those in Amador county, and also the gold mines of Salt Spring valley, in Calaveras county. This belt may also be considered as embracing the gold mines near Hornitos, Mariposa county, and the copper mines farther south in Mariposa and Madera counties. This might be properly called the west lode.

East of this, a distance of about eight to ten miles, is found the most important gold-bearing belt of the State, which has unfortunately received the name of the Mother Lode. This, it seems to me, it would be well to designate as the Central Lode of the gold belt. It must be understood and remembered that the lode is nowhere continuous for a very great distance, but is frequently interrupted by its complete disappearance for considerable distances. Lying eastward of this, in Mariposa county, a distance of nearly twenty miles, and extending in a northwesterly direction through Tuolumne and Calaveras counties, is the third gold belt, which, in Amador county, has approached to within six or seven miles of the central belt. This is known as the East Lode, and embraces many important mines. Still farther eastward lies at least one mineral belt which has been opened at a few points, but of which comparatively little is known. This lode might be called the Sierra belt or lode.

It is with the Central gold belt, however, that we have chiefly to deal. For years, in fact since its early history, the Mariposa beds (clay slates) have been considered an absolutely essential feature of the important gold mines of this belt. The veins have been referred to as "contact veins," and in many sections the immediate contact or close proximity of the clay slates of the Mariposa beds has been deemed indispensable to pay rock. Such, however, is apparently not the case. Among the deepest and most extensive mines of this belt are those of Amador county, and while it is possible that some of these mines are confined wholly to the Mariposa beds or occur at contact with the Mariposa slates or greenstone, if such exist they are unknown to the writer, for, without exception, the large number of accessible mines prove that the Mariposa clay slates form really no important figure as related to ore deposition. The fissures in which these ore deposits occur with no exception, so far as the writer is aware, cut the dip of the inclosing rocks. The dip of the slates and schists is to the eastward, usually at an angle varying from 50% to 80%, while the dip of the vein, universally somewhat less, is approximately in the same direction. In many instances the fissures have been observed to cut the inclosing formations in both strike and dip.

In the mines of Amador county are found a black slaty rock often approaching in physical appearance the clay slates of the Mariposa beds, but that these black slates found in close association with the ore deposits of this county are not clay slates, but that they are the result of an extreme alteration of the greenstone tuffs, there can no longer be any doubt. In every mine accessible to the writer, from the Pocahontas, near Drytown, on the north, to the Argonaut, near Jackson, on the south, these black slates were found associated with the ore deposits, and in many instances great care was taken to investigate carefully their relation to the greenstones and clay slates and in each case a complete but gradual transition from the normal rock to a black rock with perfect slaty cleavage could be traced. The dumps of the Plymouth Consolidated mines are largely made up of these greenstone black slates, and it is probable they are not unlike the others. The Mariposa beds are frequently found in many of these mines in crosscuts which extend to the eastward or the westward of the main vein channels but rarely are they found in contact with the ore deposits themselves, and in no single instance within the limits described was an important ore body found associated with the Mariposa clay slates, nor are the ore bodies found for any considerable distance at contact with the Mariposa clay slates. In fact the fissures, where passing through the Mariposa clay slates, are usually destitute of value in Amador county. Where the Mariposa beds are exposed in various crosscuts it is sometimes impossible to find the line of demarkation between the metamorphic clay slates and the slaty rocks resulting from the alteration of the greenstone tuffs. On the other hand, there are numerous instances where the change is abrupt and sharply defined. It is interesting in this connection to know that in several shafts sunk near Jackson in the Mariposa clay slates no ore of value has been developed, though in two cases, at least, this development was very extensive.

This peculiar condition, however, appears to be local, as in Calaveras county the best portion of the Gwin mine is found in the clay slates of the Mariposa beds, and the Princeton vein is also wholly within these clay slates, none of the diabase tuff being observed in that locality. In Amador, however, it seems important to make the distinction in view of results thus far obtained.

A microscopic study of these rocks has been commenced by H. W. Fairbanks for the writer, and results thus far show that the peculiar appearing black slates found associated with the ore bodies of the large mines of Amador county are the result of the alteration of diabase tuffs. These tuffs are found intercalated with clay slates, which explains some of what would otherwise be peculiar geological occurrences. The liberal use of the microscope on the rocks of the California gold belt will throw much needed light on this subject.

(TO BE CONTINUED.)

The Cyanide Process at Mercur, Utah.

NUMBER II.—CONCLUDED.

THE ROASTERS.—As roasting furnaces for base ore, they have a capacity of seventy tons of roasted ore in twenty-four hours, this capacity, of course, varying somewhat with the varying character of the ore. In roasting base ore the furnaces are driven at about 40 feet per minute rabble speed, with a 4-inch bed of ore on the hearth. As calciners, they have about double the above-named capacity, which is obtained by speeding them up slightly and increasing the feed so as to run a much thicker bed of ore, usually about 6 inches. It requires a given particle of base ore about eight hours to pass through the furnaces, while the talcose ores, which only require heating to a dull-red heat, pass through in six hours. The Jackling furnaces have been found better adapted to roasting than the others, both in lower fuel consumption and greater capacity, and are used for that purpose. The other furnaces, which require an excessive amount of fuel to maintain them at high heats, are run at a low heat as calciners. About the same amount of fuel is required for the furnaces whether run as calciners or roasters, viz.: six and a half tons of slack coal per day. All the furnaces are run with a light forced draft, Sturtevant blowers being used for that purpose. After being roasted or calcined, as the case may be, the heated ore is elevated at the discharge end of the furnace to sheet iron floor above, and is conveyed by the rabbling mechanism in its return motion to the feed end of the furnace. During the six or eight hours required for its return trip it has become cooled, and is sprayed with water until slightly moist, for the double purpose of giving a more porous charge in the leaching tanks and avoiding dust in handling it to them. Just before reaching the feed end of the furnace again, the now roasted and cooled ore is discharged off the side of the furnace and automatically fed to the mixing and charging bin, from which it is drawn into cars for charging the leaching tanks. Four of the furnaces are in such a position that they discharge by gravity into this bin or pit, which is excavated in the middle furnace level, the ore being brought to it from the other furnaces by a system of belt conveyors. Into this pit is also drawn the oxidized ore from the finished ore bin, and it is essential that care be taken to get the most intimate mixture of all classes of ore before charging into the tanks, as otherwise greatly varying leaching rates will maintain, through the different characters of ore, crushed to different degrees of fineness in the same charge, and uniform leaching results be impossible.

The bottom of the charging pit is reached from the leaching section at the level of the top of leaching tanks by a short double-compartment tunnel. Here, for the first time since leaving the mine, the ore is handled manually, being drawn out of the charging bin into one-ton side-dumping basket cars, and dumped into the tanks from four tracks running longitudinally over the tops of them for the full length of the section.

The filters in the leaching tanks are of gravel, 4 inches deep. In constructing them a lattice work is made of 1x4-inch pine strips, set on edge longitudinally with the tanks, spaced 5-inch centers, and held in place by 4x1-inch block, placed 18 inches apart and nailed in, thus making a stiff framework, with compartments 4x18 inches and 4 inches deep. These are filled with two inches of gravel sized to about ¾ inch, 1 inch of gravel sized to about ½ inch, and 1 inch of coarse sand. Between each of these layers of filling is laid a strap of 12-ounce burlap, fitting the compartment neatly. On top of the finished gravel bed a covering of 12-ounce burlap is tacked, and over this a second covering of 16-ounce burlap. Iron strips are then fastened over the covering by nailing them through to each longitudinal strip of the frame. These strips are to protect the cloth in shoveling out tailings. This filter is very effectual, giving a perfectly clear solution under all circumstances. The top covering of 16-ounce burlap has to be renewed about once a year, and in two years it is necessary to renew both covers and replace the 1 inch of sand with fresh material, on account of its having collected enough fine slimes to become hard and slow of filtering. Two men on an eight-hour shift tram the pulp to a tank and fill it, and one additional man, half a shift, levels off the surface and prepares the charge for applying the first solution, and as this labor is paid $2.50 for eight hours work, it will be seen that the ore is charged into the vats for less than 2½ cents per ton. All tanks are connected bottom and top to one strong solution main, and at top only to weak solution and water mains. The first solution is applied to the ore from the charge under a 14-foot head from the standardizing tanks above. This solution contains from four-tenths to five-tenths of 1% potassium cyanide, or eight to ten pounds of the solid salt per ton of solution, and is allowed to saturate the charge slowly until solution begins to appear at the surface, which requires about eight hours, when it is shut off at the bottom and sufficient additional solution run on top to cover the charge about 2 inches. Thus it is allowed to stand for about sixteen hours, when the bottom outlet is opened and percolation started, strong solution being again run at the top. This is continued for twenty-four hours, and is followed by a weaker solution of strength $\frac{2}{10}$ to $\frac{3}{10}$ of 1% for from forty-eight to seventy-two hours, or until preliminary samples, which are taken every day, indicate that the charge is ready to wash and discharge. Washing and draining requires about twenty-four hours, making the total time from the application of the first solution to the discharge of the final wash five to six days, and from the time when the tank begins charging till it is again ready to be filled, six or seven days. All solutions, whether strong, weak or wash, coming from the leaching tanks run into a common launder direct to the gold solution storage tanks. Percolation is continued without interruption when once started. When a strong solution of $\frac{4}{10}$ of 1% is being used, these mixed solutions coming from the various leaching tanks, have a strength of $\frac{33}{100}$ to $\frac{35}{100}$ of 1%, and this solution, after being precipitated, is pumped back and used as weak solution without the addition of any fresh cyanide. The leaching rate varies greatly with the character of the ore in the charge, being most rapid with charges containing a large proportion of the coarsely crushed oxidized and calcined mixed ores. The practice is to allow ¾ to 1 inch depth of solution in the leaching tank to pass off each hour, but with charges containing a large proportion of base ore this rate is frequently not attainable, sometimes dropping as low as ¼ to ½ inch per hour, thus requiring that the charge be given longer time in order to get the necessary amount of solution through it, or that vacuum pumps be used, which is now sometimes done, although the standard practice is to leach by gravity only. The best results are attained when the solutions and wash passing through the charge is about two tons of solution to one ton of ore. A peculiar condition sometimes arises in tanks containing large proportions of roasted base ore, or all of this class, from the fact that the proportion of calcareous clays and siliceous limestones are right to make a pretty good cementing material when burned, and in such cases the charge sets and becomes very hard after about two days' contact with solution, rendering preliminary sampling with an auger very difficult and greatly impeding percolation. When the percentage of limestone is exceptionally high in the ore, and is pretty thoroughly burned to lime in the furnaces, its subsequent hydration on contact with the solution will even cause a tank charge of ore, all of this class, to swell perceptibly, and in such cases leaching becomes extremely slow and difficult. The consumption of cyanide in leaching is about nine-tenths of a pound per ton of ore, one-half of which amount is consumed from the first strong solution applied, and a considerable portion of the remainder is lost by imperfectly washing out the weak solutions. The actual consumption from the weak solution during its several days of contact is inconsiderable.

THE SOLUTION.—The standard strong solution is made by adding the necessary cyanide in lumps to the weak solution formerly described. Before bringing cyanide strength up to the standard, however, a sufficient quantity of caustic acid soda is added to bring the solution to a fixed standard of alkalinity, about a ton of caustic soda per ton of solution being used for this purpose. By this means a very great saving of cyanide is effected, amounting, as found by practice, to be about one pound of cyanide saved to every pound of caustic soda used. On account of absence of sufficient water to flush tailings out of tanks, these are discharged by shoveling through gates in the bottom into cars below, holding three and a half tons, and trammed out of the building by men. Each tank is provided with eight discharge gates, 15 inches in diameter, located above four longitudinal tracks running the full length of the building below the tanks. Discharging a tank takes five to seven hours, and costs 6 to 8 cents per ton, depending on the condition of the charge of tailings, i. e., whether they are more or less compact.

Precipitation of the gold from the solution is effected by means of zinc dust. The material used is the blue powder by-product obtained in zinc smelting. The dust used by the company is imported from England or Germany, and contains about 90% metallic zinc. The solution is pumped from the gold solution tanks to the precipitation tanks, of which there are three. Thirty tons of solution is a charge for precipitation in each tank. While the tank is filling, air at ten to fifteen pounds pressure is blown into the solution through a half-inch pipe, keeping it in a state of violent ebullition. This is done to stir up the precipitate that has settled to the bottom of the tank from former charges, and which contains a large amount of unconsumed zinc. Five pounds of fresh dust is used for every charge of thirty tons, this amount being sieved in, beginning when the tank is half full, and continuing the additions at intervals until the tank is full and the zinc has all been added. The air pipe is then moved about the bottom of the tank for a short time, to thoroughly stir up all sediment again, and then removed, and the suspended matter allowed to settle about half an hour, when the supernatant solution is drawn off through an opening in the side of the tank 8 inches above the bottom, and as it still contains considerable quantities of suspended gold slimes, it is passed through the filter presses to collect these, and runs from them direct to the barren solution sump. It is seldom necessary to use pressure to force the solution through the presses, other than the head of 18 feet between them and the bottom of the precipitation tanks, but sometimes this has to be done when the presses become well filled with slimes, and for this purpose two pressure tanks of thirty tons capacity each are suspended beneath the precipitation tanks, and connected with them by large pipes, so that a tank of solution can be discharged into them in a very few minutes, and thence forced through the presses, and when it becomes necessary, the solutions can be handled in this way as rapidly as when the presses are free to work by gravity. The filtering medium used in the presses is two layers of light canton flannel, between which is placed a sheet of heavy unsized paper. The precipitating and filtering operation is continuous, as while one tank is filling another is discharging and the third settling, and by this system as much as 2500 tons of solution has been precipitated in three tanks in twenty-four hours. The dust precipitation is almost instantaneous, being complete in a sample taken at once after the last zinc has been added. The precipitated solutions, after passing presses, rarely exceed 20 cents per ton in value and are usually lower. The consumption of zinc dust is about one and a third pounds per ounce of gold recovered.

MONTHLY CLEAN-UPS.—Clean-ups are made monthly, and require about three days, working on the day shift only. The precipitating tanks are allowed to drain, and the wet slime scooped into pans, after which the tank is washed out into the presses. At the same time the presses are opened and cleaned. The long time occupied in collecting the product is on account of having to clean one tank and three presses only at a time, so that the operation of the plant is only slightly inconvenienced. About half the total value is found in the presses, although the weight of product recovered from the tanks is three-quarters of the whole. The product is taken to a refinery in a separate building, and dried in shallow iron pans in a furnace having large cast-iron muffles, into which the pans are put. The cloths from the filter presses are also burned and the product brought to a dull heat, by which most of the remaining metallic zinc is oxidized. After cooling, it is pulverized through a ¼-inch screen and sampled. It usually contains from two and a half to three ounces of gold per pound of dried product. It is next treated in a lead-lined dissolving tank, with a mixture of dilute sulphuric and nitric acids, by which the remaining zinc and zinc oxide, arsenic and mercury are removed, as well as considerable quantities of lead coming from the zinc, and complex cyanides, lime, etc., from the solutions. The nitric acid is used to more effectually oxidize these substances, as well as to, in a great measure at least, prevent the evolution of the deadly arseniuretted hydrogen gas. The dissolving tank is covered with a closely fitting hood, which is connected to a large exhaust fan, taking the disagreeable and dangerous gases entirely outside the building and discharging them from a tall stack. The action of the acid is very violent, and it must be added in small quantities to avoid its boiling over the top of the tank. When the addition of fresh acid fails to cause further action, the tank is filled with water and allowed to settle. The supernatant liquor is then drawn off through a pressure tank and filter press, and the slimes again agitated with fresh water, this latter operation being repeated twice, to free them, as far as possible, from soluble salts. The slimes are then flushed into the pressure tank, filter-pressed into cakes, dried, coarsely pulverized, mixed with a flux of soda, potash and borax glass, and smelted in graphite crucibles in a double oil-burning furnace, capable of receiving two No. 300 crucibles at once. At this stage, before melting, the product contains 60% gold, the other 40% being largely siliceous slimes. The resulting bullion is 950 fine, and is cast into bars of 1000 ounces for shipment. This plant is the only one in the district refining its own product, all the other mills shipping to Eastern refineries. The total cost of refining is about 15 cents per ounce of gold.

Nothing has been said regarding the capacity of the mill, for the reason that this is a variable quantity, depending on the proportions of the various classes of ore being treated. The plant is designed to handle 1000 tons, run with seven furnaces on base ore and two on mixed, which gives 800 tons capacity of roasting and calcining ores, and supplied with 200 tons per day of oxidized and non-roasting ore. This capacity it handles with the utmost ease, the crushing equipment being equal to considerably more. If more calcining and oxidized ores are delivered to the mill, the capacity increases, by reason of more furnaces being used as calciners, and putting through double the tonnage they do when used as roasters. If the base ore delivered increases beyond the proportion stated, the capacity of the mill decreases correspondingly. The mill is designed to take the various ores in about the proportion they exist in the mine, but its operation is varied to suit conditions in the mine with regard to the most economical and complete extraction of the ore as it occurs, and the ore bodies are very spotted as regards the different classes of ore.

The Census Now Being Taken.

The count of the people in the United States began in all parts of the country June 1, and will end in the cities in two weeks and in the rest of the country before the close of the month. The people are to be counted at their places of residence; but, as many persons and families will be away from their homes during June, there is some danger that such persons will not be counted. If they are not counted, the locality in which they live will be misrepresented to that extent, and in some cases this misrepresentation may be enough to affect the representation in Congress of the State from which they come. Local pride and State pride, therefore, should influence all such absentees to take reasonable precautions against being omitted from enumeration in their places of residence. Such omissions are most likely to occur in the large cities where families close their homes and go elsewhere for the summer. The occurrence of the Paris Exposition this year is likely to increase the number absent from the country.

In all cases of contemplated absence, the head of the family is requested by the Census Office to communicate with the supervisor of the district in which he lives. He is also requested to leave information regarding his answers to the questions which are to be asked with some responsible neighbor who will agree to see that it reaches the enumerator on his rounds. Such information might better be left as a memorandum in writing, as in that case it is less likely to be overlooked. The questions to which answers are desired apply primarily to the population, but also to all mines and manufacturing establishments. They are being published from time to time in the press of the country.

By taking this trouble the absent citizen will do justice to his locality and his State and materially aid the Census Office in the performance of its duties.

The census schedule will include inquiries about the age, color or race, date of birth, conjugal condition, number of years married, place of birth, year of immigration to the United States, naturalization, occupation, number of months not employed, school attendance, and ability to read or write of all persons to whom these questions are applicable. In addition, inquiries will be made about the ownership of property.

CENSUS QUERIES.—The blank schedules to be used in the census have been distributed by the Census Office to the enumerators, who started to work yesterday. The schedules contain questions which some persons may think prying, purposeless or excessive in number. But their number and character have been determined by Congress, not by the Census Office, and all of them have been asked in previous censuses. The only important change since 1890 is that some questions have been abandoned.

People are often offended at the question, "How old are you?" and are apt to wonder what use the Government can make of their replies. Taken as a whole, the replies are as important as any class of information the Census Office collects. Age returns penetrate and elucidate every other branch of statistical knowledge. They show where child labor is prevalent, and where the proportion of persons able to support themselves is large or small. They reveal the great number of colored children and the short life of the negroes under present conditions. They make it possible to ascertain whether the average length of life is increasing or decreasing, how many men the nation contains who are capable of voting or of bearing arms, and whether the relative number of children is increasing or decreasing.

In Mohammedan or semi-civilized countries like India householders are often unwilling to answer the question regarding the sex of persons in the house, but in civilized countries where the sexes are regarded as on an equality, such unwillingness does not appear. The answers to the questions show that in nearly all cities the females outnumber the males, and that the same is true of most of the States along the Atlantic coast. The belief is widespread that, taking the world in general, there are more females alive at any given time than males, and that if it were not for immigration there would be more females in the United States than males. But census statistics show that we can not explain the great excess of males (over one and a half million) in the United States by immigration alone, for when the foreign-born are left out of account there are still above 600,000 more males than females.

Few would dispute the necessity for asking questions regarding race. All arguments regarding the future of any particular race in this country, like the Indian, the negro or the Chinaman, must hinge upon the returns in the census. With the Indians, moreover, it is of the highest importance to learn what success the policy of the Government has met with in establishing them apart from their tribes and reservations, and whether such Indians are increasing or decreasing.

Some mothers may shrink from stating the number of children they have had and the number who are living. But from the answers to these questions the country will learn whether the native American population is holding its own or whether, as some have claimed, it is being gradually supplanted and displaced by the children of recent immigrants.

In the light of such explanations, and only a few of the most important questions have been touched upon, it may perhaps be clear to the public that no question has been ordered by Congress, or has been asked by the Census Office, which, if properly and correctly answered, will not lead to suggestive inferences regarding the American people and their work.

Using the Exhaust.

Consul Mason reports from the technical school at Charlottenburg something of interest in steam engine economies. The process of G. Behrend, a Hamburg engineer, and Dr. Zimmerman of Ludwigshafen, is said to increase the power 50%. The increased power is derived from the exhaust steam of the engines, be it simple or compound. Instead of seeking to condense the exhaust steam and thereby lose its latent heat in the condensing water, the idea is to employ this waste steam to create a new supply of steam by evaporating some liquid which has a lower boiling point than water, and for this purpose sulphurous acid was chosen. This is comparatively cheap and easily obtained, and is a viscous liquid.

To test the efficiency of the scheme a compound engine of about 34 H. P. was fitted with an auxiliary engine employing vaporized sulphurous acid in its cylinder, and it is claimed this combination yielded 53 H. P. on the same steam consumption.

The test plant consisted of a two-cylinder compound engine, having cylinders 13.4 and 20.8 inches in diameter respectively, a stroke of 19.7 inches and a speed of 41.5 revolutions per minute. From the low pressure cylinder the steam passes into what is termed a vaporizer, or condenser. The cooling medium used instead of water is sulphurous acid, which has a boiling point so low that it is immediately decomposed by the heat of the exhaust steam, where sulphur dioxide gas is liberated, and passes over into the cylinder of the auxiliary engine, where work is done as in an ordinary steam engine. This auxiliary cylinder has a diameter of 11.81 inches and a stroke of 19.7 inches, with a speed of 77 revolutions per minute.

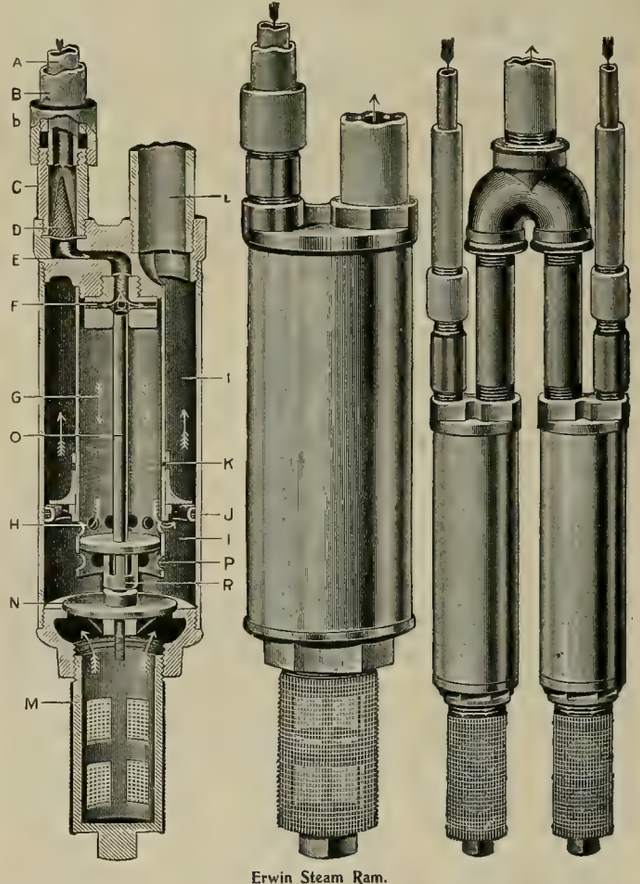
After passing through this cylinder the sulphurous vapor enters a surface condenser, around the tubes of which cold water flows as in an ordinray steam plant. Here the sulphurous vapor is condensed to liquid and is forced by a pump back into the vaporizer, where it begins its cycle again, the same sulphur dioxide gas being used over and over again indefinitely. There are, therefore, two condensers. The first serves as a boiler or steam generator for the auxilary engine, and this boiler, instead of being fired by coal, obtains all its heat from the exhaust of an ordinary steam engine. and instead of converting water into steam evaporates a liquid which is more volatile; that is, which has a lower boiling point.

With this outfit a long series of tests were made, of which the following is a statement of the results obtained:

The compound engine, as above, being given a steady load, developed 34 indicated H. P., with a steam consumption of 18.96 pounds of steam per indicated H. P. The auxiliary machine working with the sulphurous vapor indicated 19 H. P., that is, showing an increase of 56% and yielding, instead of 1 H. P., 1.5 P. H. for the same steam consumption, thereby reducing the steam consumption from 18.96 pounds per indicated H. P. to 12.13 pounds.

For the increased expense of the first cost of the vaporizer, condenser and auxiliary engine the available output of the engine is therefore, according to these experiments, increased 50% without adding a pound to the fuel consumption, except such as may be required for pumping the condensing water and forcing the sulphurous acid back into the vaporizer.

Yet the fact that the experiments as recorded were made at a technical school of high standing commands attention for what may be a step in an original direction in the perfection of steam engines in the matter of efficiency.



THE future steam engine, in the opinion of C. T. Porter, is to depend upon mechanical draft instead of chimney draft. At a late meeting of the American Society of Mechanical Engineers he stated that the new engineering has established that the boiler furnace shall be independent of natural draft, effectually consuming its smoke, and burning two or more times as much coal as it could do under natural draft alone, and yet sending off the gases at a low temperature; the boiler being a steam generator, a superheater and a fuel economizer combined.

The Erwin Steam Ram.

Herewith is illustrated, sectionally, the Erwin Steam Ram, patented by Jas. B. Erwin and William Kirkwood, and manufactured by the Penberthy Injector Co., Detroit, Mich.

When the ram is at work, water is elevated alternately by steam and atmospheric pressure. The steam, having driven the water from the ram, condenses, and a vacuum is formed; a volume of water is then driven into the ram by atmospheric pressure, filling the vacuum chamber, a large part passing on through the ram and into its discharge pipe, the steam and air thus coacting to make the discharge of water continuous.

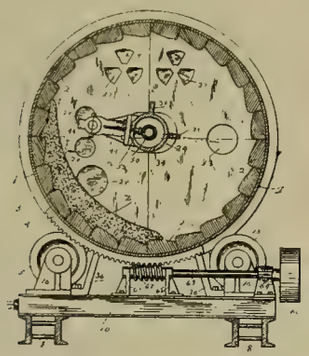
The ram is put beneath the surface of the water, and, before starting, water flows into it by gravity. When the steam is turned on it passes through the steam pipe A, nipple C, conical screen D, the main steam port E and radial steam ports F into the cylinder G. The water is then forced downward through the openings H into the surrounding discharge chamber I, where it passes through the annular check valve J, and out of the discharge pipe L. When the steam reaches the lower end of the cylinder G, it is exhausted through the large openings H much faster than it is admitted through the steam ports F, is condensed in the surrounding discharge chamber I, and a partial vaccum is formed within the cylinder G. The vacuum is made more complete by a spray of water which then rushes inward from the discharge chamber I through the small opening K. When a vacuum is created and condensation occurs the pressure of the atmosphere on the water outside of the ram forces water upward through the bottom strainer M. The check valve N then rises and the valve rod O, which is rigidly attached to it, shuts off the steam at the upper end of the cylinder. A volume of water under atmospheric pressure is at the same time forced upward through the discharge chamber and out into the discharge pipe. A portion of this water, however, passes through the openings P, forces up the float R, which moves freely on the valve rod O and refills the cylinder. The water under atmospheric pressure having then lost in momentum, the steam, acting downward on the valve rod, closes the main check valve, and, through pressure exerted on the float, again forces water out of the cylinder and through the discharge chamber and discharge pipe. A covering pipe B surrounds the steam pipe for the distance it is submerged beneath water, to prevent condensation, and is received into the coupling b. By connecting the discharge pipes of two rams with a common discharge chamber a double ram can be formed, as illustrated.

Erwin Steam Ram.

Mining and Metallurgical Patents.

Patents Issued May 22, 1900.

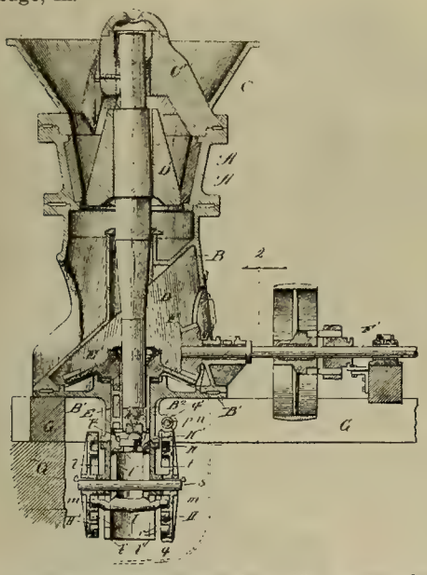
Specially Reported for the MINING AND SCIENTIFIC PRESS.



EXPLOSIVE COMPOUND.—No. 649,913; S. Clark, Gold Hill, Or.

Explosive compound formed by mixing nitrate of soda, sulphur, metallic antimony, carbonaceous matter, picric acid, nitric acid, rosin, water and a reducer.

METHOD OF EXTRACTING PRECIOUS METALS FROM ORES.—No. 649,962; E. A. Smith and M. H. Lyng, Anaconda, Mont.; assignors to the Illinois Reduction Co., Chicago, Ill.

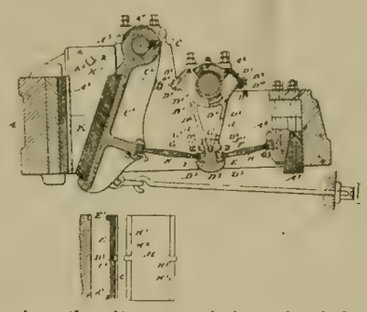


Suitably electrolyzing an alkali-metal-chloride solution to form in part oxychoride leaving sodium chloride in excess in resultant leach liquid, digesting pulverized ore in suspension with mixed chloride solution and free acid to release chlorine and effect solution of the gold, silver, (and copper, if present,) properly precipitating from separated solution and after removal of such precipitates, partially evaporating mixed chloride solution remaining so as to separately recover by fractional crystallization alkali-metal chloride present, digesting by means of suitable reagent (with aid of free steam if necessary) concentrated mixed chlorides left over as residue from such fractional crystallization, condensing vapors of hydrochloric acid thence evolved, separately dissolving recovered crystals of alkali-metal chloride, thereupon treating such solution electrolytically to regenerate same into state of oxychloride for reuse.

ORE ROASTING FURNACE.—No. 649,999; J. C. Teller, Minneapolis, Minn.

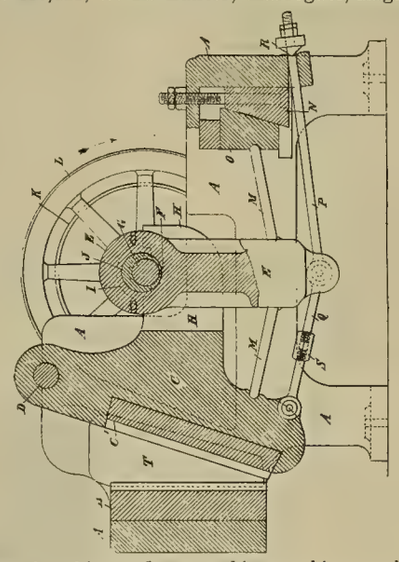
In an apparatus for the treatment of ores or similar material, combination with rotary drum, of gas supply pipe 34 and air supply pipe 56, former surrounding latter and extending through drum, one or more laterally projecting tuyeres consisting of outer section 44 opening from gas pipe 34 provided with elongated discharge opening 45, and inner steam sections 52 provided with elongated nozzle section 53, terminating within and located concentric opening 45.

CRUSHING MILL.—No. 650,097; M. J. E. Rotter, Chicago, Ill.



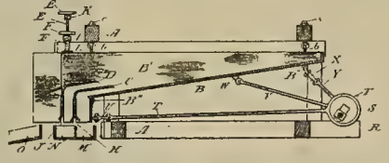
In crushing mill, combination with crusher head and its supporting spindle, of raising and lowering mechanism for head, comprising vertically sliding block upon which spindle is gyratively mounted at lower end, yoke supporting block, shaft, wheels rigid upon shaft provided with coincident spiral cams engaging yoke, worm teeth on wheel, worm engaging worm teeth, an operating handle for worm.

PROCESS OF EXTRACTING GOLD, SILVER OR OTHER METALS.—No. 650,019; J. C. Montgomerie, Stair, Scotland, and H. Parkes, London, England.



Calcining the ore until sulphides are converted into sulphates and oxides, subjecting calcined ore with compound composed of common salt, sulphuric acid yielding agent and an oxygen yielding substance to a red heat without admission of air, treating mass with water to remove soluble salts, subjecting residue to sulphuric acid, then washing the mass, subjecting residue to solution of hyposulphite of soda, finally subjecting residue to a gold solvent.

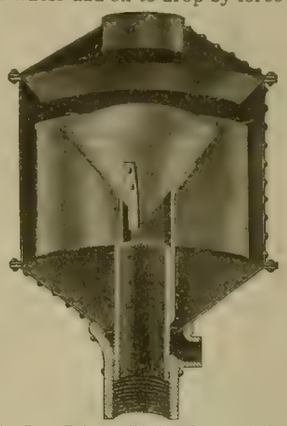
ROCK CRUSHER.—No. 650,105; E. C. Bacon, New York, N. Y.



A crusher, the pitman consisting of tubular head D′ inclosing eccentric B′, converging webs D^2 extending tangentially from head and joined at lower end D^3, transverse webs D^4, toggle bearings E, flanges D^5 supporting latter, swells D^6 formed on pitman in proximity to flanges, wedges F F′, and bolts G extending through converging webs and wedges, inner nuts G′ on bolts and outer nuts G^2 thereon, all combined, and means for locking bearing to support.

OPERATING MECHANISM FOR STONE OR ORE CRUSHERS.—No. 650,121; W. H. Baxter, Harrogate, England.

Stone breaking and ore crushing machine, combination of movable jawstock, shaft on which movable jawstock is mounted, brackets at rear of and moving with jawstock, shaft carried in brackets, an eccentric mounted upon shaft, pitman mounted on eccentric, adjustable drawback rods attached together at one end at lower end of pitman and at other ends respectively to movable jawstock and framework of machine, toggle block at rear of machine, wedge at back of toggle block, toggles respectively interposed between movable jawstock, pitman, and toggle block, and flywheels and driving pulley mounted upon eccentric shaft.

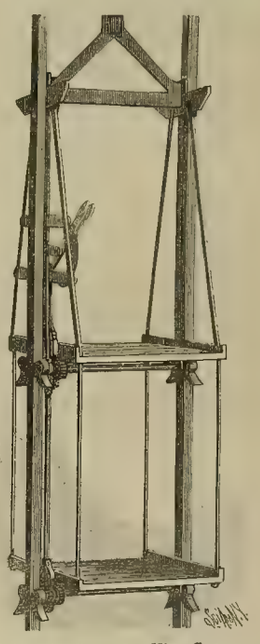


CONCENTRATOR.—No. 650,138; C. A. Smith, Los Angeles, Cal.

Concentrator comprising trough B gradually decreasing in width from head to tail, having sides B′ gradually increasing in width from head to tail; adjustable separating plate C for separating gangue from semi-concentrates; yoke Y attached to plate C having threaded socket for reception and working of screw F adapted to work in screw threaded in yoke I having hand wheel F′; yoke K attached to plate D; screw E rotatively attached to yoke K and adapted to work in screw threaded opening in screw F and having hand wheel E′; chutes M N and O for carrying away respectively the concentrates, semi-concentrates and gangue.

The Burt Exhaust Head.

The Burt Mfg. Co., Akron, O., makes and sells the exhaust head shown in the accompanying sectional illustration. It is of unusual form; has perpendicular sides to give it greater area inside, and more room for steam expansion for the prevention of back pressure. There is but one steam chamber, the entire head, attached to the exhaust pipe of the boiler system to prevent oil and watery steam from getting out. Only dry steam escapes. The exhaust steam, after coming through the pipe, strikes the cone immediately over the inlet. This cone separates the steam into the finest particles, condensing some of the vapor. The greater volume of steam rises up to the small projection extending around the top of the head, and is held there for an instant, causing the particles of water and oil to drop by force of gravity



The Burt Exhaust Head — Sectional View.

down between the double walls on the side and out through the drip below. Joints, seams and attachments are water tight.

The Burt exhaust head is not an experiment, but has been tested by time and service. It is made of heavy iron, lapped, riveted and soldered, and covered with anti-rust paint. Further information can be procured of the manufacturers.

Safety Appliance for Mine Cages.

A device herewith illustrated, a patent for which is held by Cook & Wishon, of Butte, Montana, relates to stopping the movements of mine cages, being so constructed as to provide a means of holding the cage under the control of the cage tender, and may be adapted to cages having any number of decks. Mounted in the framing of the cage below the deck on platform are two shafts, to the ends of which are fixed dogs, which have toothed cam surfaces adapted

Safety Appliance for Mine Cages.

to bear against the guides of the shaft to grip them and stop the cage. To each shaft is fixed a pinion, which meshes with racks which extend vertically between the pinions and fastened to their upper ends to a link. By the movement of the links the pinions and shafts may be turned and the dogs thrown into and out of engagement with the guides. The upper end of the link is pivotally joined to a lever fulcrumed on a stud projecting from the framing of the cage. The invention has been applied in the Speculator mine, Butte, Montana.

Treatment of Copper Mattes in the Bessemer Converter.*

NUMBER IV.

THE CHARGE.—No one to-day is following the line of Holloway's procedure in endeavoring to smelt ore except as lining in the converter. The charge is invariably matte, but it varies widely in percentage. No matte can be too low in copper to absolutely prohibit its treatment by this method, the question of grade being merely a question of economy, and the item of cost involved being that of lining. The higher the matte be in iron, the more certain it is, therefore, to shorten the life of a lining. If, therefore, the lining be barren of valuable metals, the extra cost of the material, plus the cost of replacing it, involved in the treatment of lower instead of high grade matte, may be in excess of the cost of producing a higher grade of matte by some other method, or by changing the furnace mixture. If, on the other hand, the lining consist of gold, or silver, or copper ore, their rapid consumption as lining may prove to be the cheapest way of smelting them. No rule, therefore, can be laid down as applicable to all conditions and circumstances. The usual practice to-day in Western works is to charge the converters with a matte of about 50%. But at Aguas Calientes, where the Messrs. Guggenheim line their large converters with silver ores, it is found profitable to use matte of a lower grade. The quantity of copper a stand of converters will turn out is, of course, regulated by the grade of the matte, and therefore a larger plant is required to turn out a given amount of copper when running on a low, in preference to a higher, grade matte. The item of interest on plant is therefore affected.

The methods of conveying the mattes from the smelting furnaces to the converters has already been referred to. The converter, when being filled, is tilted sufficiently to prevent the matte entering the tuyeres, and the blast is turned on before the converter is restored to its vertical position.

The series of operations in actual practice consist of the first blow lasting about twenty minutes, during which the iron is oxidized and converted into slag, at the expense of the lining, and not quite one-half of the sulphur volatilized or oxidized. The converter is then turned and the blast thrown off. The product is white metal and slag, most of which is poured, the last of it being removed by a rabble. If the matte has been poor, or the converter capacity much increased by corrosion of the lining, a second charge of matte is added to the white metal, and the first blow is repeated. The converter is turned again, and the slag repoured and reskimmed. The second blow lasts somewhat longer than the first, and results in copper of about 99%, and a small quantity of slag, part of which remains in the converter in loose granular condition, and can be emptied by merely reversing the converters. The copper is usually poured into deep moulds mounted on a long carriage, which is wheeled back and forward beneath the converter. The moulds are made, as previously stated, usually of cast iron or steel, though in some works of coarse converter copper. In a few cases, as in the Heinze works, already described, where the gold and silver contents is high, it is poured into shallow moulds, and cast into thin plates for greater certainty in sampling. Anodes are sometimes cast direct from the converter into open moulds. They are, however, rough, and being of equal density make an inordinate amount of scrap in the electrolytic vats, and are very liable to occasion short circuiting. I have made smooth anodes in closed vertical moulds, bolted together with clamps like brass bar moulds. But it requires consummate skill to stop the blow just at the moment when the copper after pouring will not boil. As a rule, it is better to expose the copper, as at Anaconda, to partial refining before casting into anodes.

The duration of the blow is determined by the color of the escaping gases, the peculiar noise made by the escaping blast, and the appearance of the particles of solid matter ejected. During the first blow the flame is green turning to blue. During the final blow an orange flame predominates. The air guage as well as the escaping gases indicates the condition of the tuyeres. If the converter is hot and working well, little or no punching will be required during the first blow. It is after metallic copper forms that punching has to be freely resorted to, though in the trough converters, which can be revolved as reduction progresses, so that the blast shall impinge on the unreduced matte instead of being forced through reduced copper, less punching is needed than in the upright converter. In all well-designed copper converting shells the wind box gates are provided with automatic shutters or valves, which allow the bar to be inserted and withdrawn with the least possible labor, loss of time, and waste of blast. When the slag is forming rapidly at the commencement of the first blow, if the blast be excessive, slag and matte are thrown sometimes with explosive violence from the converter, and the same accident is liable to happen at the end of the first blow if carried too far. These phenomena are due probably to both mechanical and chemical causes. The dense impermeable slag is raised in masses by an accumulated superheated blast, and, as suggested by Hixon, if the charge be overblown while slag is unremoved, large volumes of SO_2 are liable to be generated by the action of cupric oxide on the white metal (the reaction taken advantage of by James and Nicholls in their beautiful direct method, $Cu_2S + 2CuO = 4Cu + SO_2$), and the escaping SO_2 causes the slag to boil and carry the slag with it out of the converter.

At no works in the United States are as large converters used as at Aguas Calientes in Mexico. There several tappings of matte must be successively blown to white metal before a charge sufficient in quantity is secured. Hixon, who was superintendent at these works, thus describes a run: "At Aguas Calientes the converter was 8 feet in diameter the largest copper converter in the world, and on low grade matte a charge of 8000 pounds for the first tap would be taken and blown to white metal; the slag poured off and a second tap of 10,000 pounds poured in, and blown to slag and skimmed in the same way. A third, and sometimes a fourth, tap would be skimmed before the resulting white metal would be sufficient to stand above the tuyeres till the charge was finished. In this way charges of 45,000 pounds of matte were not uncommon, and the resulting copper would not be more than forty bars of 200 pounds each. With matte as low as 30% the converter increased in size so rapidly, owing to the corrosion of the lining, that it was difficult to get a charge to finish. After the vessel had finished the last charge that the lining would stand, a tap of from 10,000 to 15,000 pounds of matte would be put in and blown to slag or until it was in danger of coming through the side or bottom. This was for the purpose of washing out the copper adhering to the lining after the last charge. The resulting white metal was dumped and used as scrap on subsequent charges."

But with converters of average size, operations illustrate more accurately an actual run. The matte treatment was tapped directly from the well of the furnace into the converter, and therefore no weights were taken. The converters were of the trough pattern, actual measurement of shell 96 inches by 50 inches by 48 inches deep.

Nine hours forty-three minutes were consumed in making 15,070 pounds of copper in four charges, or two hours twenty-five minutes per charge. To this twenty minutes must be added for time allowed for changing converter shells. Of this time first charge was blown up to copper in one hour eleven minutes; second charge, one hour thirty-five minutes; third charge, one hour thirty-seven minutes; fourth charge, fifty-seven minutes; total, five hours twenty minutes.

The skimming and second matte filling of first charge occupied actually thirty-four minutes; second charge, thirty-seven minutes; third charge, thirty-nine minutes; skimming of fourth charge, sixteen minutes; total, two hours six minutes.

The difference of two hours seventeen minutes, or thirty-four and one-quarter minutes per charge, were therefore spent in pouring copper, patching and charging, an excessive allowance, due in part to the system otherwise so economical of linking a furnace to one converter as previously explained. The time lost in charging shells can be saved, and the maximum amount of copper per converter in blast can be made only when a fresh converter stands charged and ready to receive the blast immediately it is turned off from a finished charge. Four stands to three active converters should be provided.

The analysis shows that iron is virtually oxidized and eliminated by the first blow, but that about 0.15% clings tenaciously to the copper. Approximately one-half the sulphur is dissipated in vapor and gas during the first blow. The fresh matte contained Cu and S in the proportion of 2.5 to 1, whereas the white metal contained about 3.7 of Cu to 1 of S. Nickel is more rapidly oxidized in the converter than in the reverberatory or cupola; the same is true, as might be expected, of the more volatile metals and metalloids.

As the weights of matte could not be taken, the loss of gold and silver can only be determined relatively to that of copper.

The silver in the matte amounted to 8.6 ounces to the ton of copper and the silver in the black copper amounted to 8.2 ounces to the ton of copper, showing a loss of 4.6%.

The gold in the matte amounted to 0.429 ounce per ton of copper, and in the black copper to 0.394 ounce per ton of Cu, or a loss of 0.035 equal to 8.2%.

The amount of gold was so extremely small that the assay results, carried to only two decimal points, are not sufficiently accurate for comparison. As in the above calculation the loss in silver is deducted from twelve matte assays as compared with only four metallic copper assays, the admitted losses made in the assaying of the silver should still further reduce the discrepancy. The above value in silver and gold represent about one ounce of silver and 60 cents worth of gold to the ton of ore; yet when concentrated in the copper bars, these minute quantities are profitably extracted.

The following analysis of matte treated and copper produced in Stalmann converter at the Mt. Lyell Company's works show a gain in both silver and gold.

The matte treated contained: copper, 53.15%; silver, 34.19 ounces per ton; gold, 2.178 ounces per ton.

The copper produced contained: copper, 98.74%; silver, 64.86 ounces per ton; gold, 4.287 ounces per ton.

Had the relations been maintained between copper, silver and gold, the Ag contents of the copper should have been only 63.3 ounces instead of 64.54 ounces, gold contents 4.03 ounces instead of 4.28 ounces.

For the David selecteur the claim is undoubtedly well founded that the first copper formed carries down the gold, the silver in larger proportion than the average of the charge, and some of the impurities, making what corresponds to impure auriferous bottoms and the best select of the Swansea reverberatory process.

Another subject of interest is the distribution of the precious metals and other impurities in the copper bars. Many anomalies seem to occur which have been discussed with a great wealth of illustrations and analysis by Edward Keller, of Baltimore, who had at his disposal for examination bars of blister made by reverbertory, converter bars, and bars of refined copper. He has supplied us with many curious facts and ingenious explanations. What is still lacking is a comparison of bars made from exactly the same ores, some by the pneumatic method, others in the cupola, and still others in the reverberatory. Not till then will the question of comparative purity and losses be settled beyond contradiction.

The following analyses made to determine primarily the movement of selenium and tellurium as the reduction of copper in the converter proceeds bear also on the concentration of the gold in the first copper reduced. Two bars poured from the converter five minutes after the commencement of the second blow contained: Cu 99.28%, Ag 16.864 ounces, Au 0.915 ounces, Se and Te 0.0156 %. The eleven bars made from the rest of the charge contained: Cu 99.40%, Ag. 11.373 ounces, Se and Te 0.0224%. It is worthy of note that the first copper formed was almost as pure as that finally tapped, and less selenium and tellurium entered the bottom than remained in the matte.

(TO BE CONTINUED.)

*Condensed from a paper read by JAMES DOUGLAS before the London Institution Mining and Metallurgy.

The Klondike Mine, Waterfall Gulch, Ophir, Colorado. (See page 605.)

The surroundings of the Klondike mine are of interest to geologists, the walls of the canyon, several hundred feet in height, appearing to be a mass of oxidized quartz in which verge veins carrying gold ore.

MINING SUMMARY.

ALASKA.

Cape Nome is the present Mecca of the miner. The historic rush to California in '49, the Fraser boom, the stampede to Pike's Peak, even the Klondicitis of '97, fail to fill the present proportions. From San Francisco and Seattle last month went many vessels carrying thousands of the best American miners, for in these adventures none but the daring start (and none but the strong survive). With them went the usual parasites and an unusual number of unskilled men and women, lawyers, broken down sports and restless people. Some of those going had as part of their outfit guns and legal attendants; others had powers of attorney and paper possession of sundry claims; others took suitable machinery, counting on that and personal efficiency to get a "lay" from some one up there possessed of a claim but lacking other essentials; others went because they had enough money to get there, and were taking chances; a few knew just what they were going to do and how they were going to do it. Meanwhile from the Yukon region, earlier, went more than enough to occupy all the available ground reported. Probably later arrivals will scatter out and find new territory; some of them invest, as they can not remain idle under such heavy expense as living at Cape Nome entails.

The most authentic accounts received indicate inevitable confusion. The uncertainty of title the peculiar circumstances recited herein heretofore in detail, the unlikelihood of Congressional action, and the still less likelihood of ability to enforce such probable action this summer, makes it manifest that throughout that arctic region in 1900 the rule will prevail "that they shall take who have the power and they shall keep who can." Shotgun title may be submitted in evidence before a quiet court of local but sufficient jurisdiction, the apparent idea being to exhaust the ground before the unwieldy process of Federal law can even get to the preliminary injunction.

The arrival of the thirty vessels within ten days of each other and their 30,000 passengers and their enormous cargoes of freight will be another source of present confusion, all landing together on a two-mile strip of sand beach from vessels compelled to lie off shore four miles, relying on the hundreds of light boats tossing in the surf to get freight and passengers ashore.

There is enormous present profit in the business to outfiters and transportation companies. Instances are furnished where a vessel costing but $20,000 gets $80,000 freight money for one trip. Those who furnish the supplies and carry the passengers will not be the first to decry the possibilities of the new El Dorado.

Nome reports that powers of attorney have been used so extensively at Cape Nome this winter that it is doubtful if any of the 20,000 men now rushing northward will be able to secure claims in Nome, York or the contiguous districts. A. Ellis, writing from Juneau, says that several hundred men at Nome have spent the entire winter locating thousands of claims for themselves and for others by power of attorney. It is yet unknown at Nome whether the powers of attorney will be recognized by the Federal officers arriving this summer to administer the laws. Ellis says the rich part of the beach, so far as prospected, is limited to 10 miles.

The Alaska Mexican mine's report for 1899 shows 166,054 tons ore mined and milled, from which there was saved $231,841, or $1.40 per ton on the mill. There were 3053 tons concentrates treated, yielding $115,574, equal to $37.85 per ton of sulphurets, or $0.69 per ton of ore milled. Adding $1682 for interest, the receipts were $349,097. The ore averaged $2.09 per ton, and the expenses were $286,764, or $1.73 per ton. This leaves $62,823 for net earnings. The dividends were $72,000, equal to 8% on the outstanding stock. The balance carried over from 1898 was $59,641, but $9667 of that surplus was drawn to make out the dividends, so that the surplus carried over from 1899 is only $49,975. The mill was operated 357 days out of a possible 363 days for the full 120 stamps. The average number employed, including Indians, was 160, at an average cost, including board, of $3.24 per diem.

Bulletin: The steamer Orizaba is at San Francisco to load lumber for Douglas Island for the Alaska-Treadwell M. Co., to be used in repairing the original mill property. This mill has 240 stamps and can be run by either steam or water power. The new mill of the same company has 300 stamps, for water power only. This makes 540 stamps. The Alaska-Mexican Co. has a mill of 120 stamps, run by steam or water power. The Alaska United Co. has a mill of 100 stamps on its 700-foot claim and another of 120 stamps running on ore from the Ready Bullion claim. Altogether the three Douglas Island companies have five mills, carrying in all 880 stamps. It is not intended to add further mill facilities for the present. The concentrates are smelted at Tacoma.

ARIZONA.

COCHISE COUTNY.

(Special Correspondence).—The Lowell-Arizona mine started work about fifteen months ago and now have a shaft down 517 feet; the company has done nearly 3800 feet of drifting. They have ore on every level in good quantities and grade and are beginning to think that they are nearly ready for a smelter. At present they are putting in a 14x15 double-reel, flat-cable engine, built by the Union Iron Works. The boilers are here and in position, and the engine and other machinery left San Francisco on May 19th and should be here this week. The company expects to open up about Aug. 1st. They are now doing most of their work on the 400 level in a body of ore. They also have three drifts going on the 500 level, one of which is in ore.

There are no veins to follow in this country, as the ore seems to lie in deposits and blankets. There is a zone about 1500 feet wide where you may expect to find ore, but you have nothing to follow, and have just to cut the country and run chances of finding it.

The Lowell-Arizona have been shipping lead ore—which is a carbonate—but have not shipped any copper, as they expect to smelt it there.

There are six companies operating here now. A good many others operating in this county are doing considerable work with good success. The company I mention is working thirty-eight men.

It is reported here to-day that the South Bisbee C. M. & T. I. Co. have encountered a rich body of ore on their 700 level.

The Cochise Co. are working ten men.

Bisbee, May 22.

Laub City reports a strike of gold bearing quartz on the Emmersly claim. A new ore body of sulphide copper in the East Off is now 21 feet through. The Forman tunnel is in 208 feet and has passed through strata of copper ore assaying 17%. The proposed townsite of Laub City is to be abandoned. The smelter site will be close to the Copper Reef. T. A. McCullough, formerly of Anaconda, Montana, is now assistant to Gen. Mgr. Noonan.

Johnson, in the Dragoons, 3 miles from Russelville, has a population of 300. At the Peabody mine 165 Mexican miners are employed. Two carloads of copper ore are shipped to El Paso daily. The Peabody is under the supervision of H. J. Clifford. At the Mammoth mines thirty-five Americans are employed.

GILA COUNTY.

At the Black Warrior Copper Co.'s leaching works they will have to get their own acid plant installed, as acid shipped in costs $40 per ton. They expect to be able to make it at their works for $6 to $10 per ton. Twenty tons of acid per day are required for the leaching works.

GRAHAM COUNTY.

A. C. Ross, who owns copper properties at Chase creek, will put in a 100-ton concentrator. J. F. Niccolls is in charge.

MOJAVE COUNTY.

At Chloride the Elkhart mine resumed work this week. The Schuylkill mine is also to resume work on its ore bodies.

Miner: There are now fifty-five men on the payroll of the Tennessee mine at Chloride. The underground workings of the mine are being put in good shape and the stopes show ore. Two big shafts will probably be sunk another 100 feet.——The Homestake mill near Pyramid, on the Colorado river, has started up. The main shaft is 369 feet deep.——About a mile from the Homestake, on the Arizona side of the river, is the Sheeptrail mill, crushing thirty tons of ore daily.

PINAL COUNTY.

R. Truman, Gen. Mgr. Ray Copper Co. on Mineral creek, 20 miles south of Globe, has an ore body averaging 5% copper. The company is working thirty miners. The ore is conveyed over the 30-inch guage railroad to the mill, at Kelvin, 6½ miles below on the Gila river. A train is eight cars, ten tons capacity. The new concentrating mill at Kelvin will be in operation next week. Its capacity is 250 tons ore daily.

YAVAPAI COUNTY.

The Congress Gold Co. will put in a pipe line from Date creek to its mill at Congress, 6 miles.

The Lyons 10-stamp mill is bought by W. B. Troy for the Trilby and Belle gold mines.

The Verde Queen smelter at Jerome is to start up this week.

The Arizona, Eastern & Montana Co., at a recent meeting of directors in New York, appointed W. Stickney Gen. Supt. of all their property in this county.

At Weaver the Octave G. M. Co. have the 40-stamp mill completed. Weaver reports the discovery of gold and silver in porphyry.

The result of the appeal from the ruling of the Tax Commissioners by the United Verde Copper Co. to the Supreme Court, for a review of the assessment levied upon the corporation for the year 1899, is that the N. Y. Supreme Court has increased the assessment from $1,440,532 to $2,373,920.

Jerome figures that the Equator, owned by W. A. Clark, has $2,000,000 worth of ore blocked out.

The Congress gold mine, owned by the Congress G. M. Co., 60 miles north of Phœnix, is bonded for $1,500,000 to New York men, including Warner Miller and John Mackay. The first payment, $200,000, was made on May 31.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—I see in the issue of May 19th that some Colorado men want to know about Camp Contreras. Supt. Joyce has a 4-stamp mill at the Defender mine and is going to make it ten. The shaft is 251 feet deep; from an 8-foot ledge ore goes to Ione, thence to the Selby Smelting Works. Near the Defender is the Poker Bill, which is now yielding ore very heavily sulphureted.

Camp Contreras, May 25.

Supt. Purington of the Fremont Consolidated mine, Drytown, has the new shaft down 300 feet. At the Gover the new hoist is being built.

Supt. Dye will resume work on the Amador Queen No. 1 mine this week.

The Argonaut at Jackson paid in dividends for the latter half of April and the first half of May $10,000.

At the Oneida at Jackson the new shaft is down 2100 feet. Work on the new 100-stamp mill is being pushed.

At the Nugget mine at Ione A. L. Adams, the principal owner, is building a 5-stamp mill.

CALAVERAS COUNTY.

In May the Gwin declared dividends to the amount of $5000.

The Shear-Lloyd mine on Central Hill is bonded to D. McN. Palmer.

The Ione Echo says that Blodgett & Fassett last week brought in forty ounces of gold as the result of their week's work in the Touhey mine.

At Mokelumne Hill the French Hill tunnel to tap the quartz ledge is completed. The vein at the point encountered is 5 feet in width and shows free gold.

Supt. Langford has rehabilitated the old Sheep Ranch mine; the 20-stamp mill and four concentrators are in operation. Eighty men are at work.

DEL NORTE COUNTY.

W. M. Brown, owner Blacksand mine, Crescent City, has started operations.

A. McVivier has taken charge of the Jones Creek M. Co.'s property at Big Flat. Men are enlarging the ditch and preparing for active mining.

MADERA COUNTY.

(Special Correspondence).—The copper smelter at Madera is running steadily. It is reported that the company will soon be prepared to work sulphuret ores of gold and silver and concentrates.

In Fine Gold district the Mud Springs mill is running steadily night and day on good ore. Sixteen men are employed. The Lily mine is shut down temporarily. The Standard has opened a 4-foot shoot of ore on the 140-foot level. Ore has also been found at the bottom of the main shaft at 400 feet. The Bryan mill at the Standard mine, on Fine Gold creek, has had a satisfactory preliminary test. The Magnet M. Co. has driven a tunnel into the vein along the hanging wall on the Noonday location. An ore shoot 4 feet wide has been opened up by a winze and drift. About forty tons of ore on the dump taken out of the workings averages well in free gold, with 1½% of sulphurets. A small mill will now be built. The new 10-stamp mill will soon be in place at the Waterloo and operations resumed.

Gold, May 29.

The Gambetta M. & M. Co. at Grub Gulch write that they want to let a contract for 2000 cords of wood.

MARIPOSA COUNTY.

Supt. Schafer of the Yankee mine, Benton mills, projects the expenditure of $50,000 in developing the property and putting in a mill.

Seven miles from Mariposa, fire on the 27th ult., at the Persia mine, destroyed a 10-stamp mill, the hoisting works and shop. The boarding house was shattered by the explosion of 200 pounds of giant powder. The fire started near the rock crusher at the top of the mill.

NEVADA COUNTY.

(Special Correspondence).—During the past year the Grass Valley Exploration Co. has acquired considerable additional ground, has paid a monthly dividend of $2500, aggregating $30,000, has spent $80,000 for new properties and has $581 in the treasury.

Grass Valley, May 28.

PLACER COUNTY.

A tunnel 1500 feet long is to be driven at Spring Garden, near Forest Hill, to tap the channels of the divide.

The Sentinel reports a strike in the Breece & Wheeler, or Paragon mine, near Bath, of a lead of blue gravel.

PLUMAS COUNTY.

For hauling 200,000 pounds of freight from Oroville to the East Branch—the machinery for a 20-stamp quartz mill and a saw mill, to be erected on the Halstead property—requires that the machinery will have to be packed, hauled on skids and a road made to the place where it is needed.

The Brandt quartz mine is in Argentine district and is known as the Crown Point. Lescher & Gobert have bought it and will erect a mill at the Crown Point. Ohio capital is backing them.

SAN BERNARDINO COUNTY.

The new diggings are north of Barstow. Some of the ground is rich. Bedrock is close to the surface. There are 200 men there now and more going. The nearest water is 8 miles away at Lane's wells. The camp is 15 miles north of Barstow and 45 miles southeast of Randsburg. Dry washers are in demand.

SIERRA COUNTY.

Supt. Dunlap, at the Alaska mine, Pike City, is running a drain tunnel. The mill will be operated on the old Alaska dump, which has been connected with the 20-stamp mill by steel rail tracks 800 feet long. The dump contains 50,000 tons, which is estimated to run $3 a ton. The mill will start night and day work next week.

SISKIYOU COUNTY.

(Special Correspondence).—A gold nugget was found by Wm. Klein of Rollin in his placer mine on May 21st, on Eddy gulch, 2½ miles above Sawyer's Bar, from which gulch it is claimed by ex-Governor Daggett and others several million dollars have been taken and that there are great values still there. The mine from which this nugget was taken was recently bought by Mr. Klein from John Hamilton, who got the Cape Nome fever and sold this property to Mr. Klein at a low figure. Mr. Klein found a $98 nugget near the same place where this one was found a few days prior to this one. The former owner had worked within 4 feet of these nuggets. The size is 5 inches long, 2½ wide; weight, 50 ounces; and is worth $775.12.

Sawyer's Bar, May 28.

From the Dewey mine, Gazelle district, a carload a day is shipped to Keswick, Shasta county.

The dredger in Yreka creek, at Hawkinsville, is ready for starting.

The Greenhorn blue gravel mine is at the 100-foot level.

At Cecilville the Deep Bank mine, owned by Mr. Cooper of San Jose, is employing ten men.

TRINITY COUNTY.

The T. G. P. M. S. Ltd. Co. is building a ditch to drain drift mining ground at the junction of Union and Coffee creeks.

At the Loftus mine Supt. Murray is pushing work on the lower tunnel.

TUOLUMNE COUNTY.

The County Miners' Association has elected W. H. McClintock president, F. Sutton secretary and J. McCormick treasurer.

Latest advices from Santa Ysabel directors are that the report of Expert Foster is satisfactory. The company will issue a statement shortly.

The Boston News Bureau says that the directors are "negotiating with capable mining men to take charge of the property." W. Foster advises following the ore chute in the Knox & Boyle property, also the Central ore chute. He values the ore in the bottom of the mine, as opened, at $17 per ton, and declares the chances for a paying mine are good, with proper management. The company's floating debt is about $75,000, of which $35,000 is due next January, and the noteholders are willing to extend the same for a year.

YUBA COUNTY.

(Special Correspondence.)—The Victor G. M. Co. owns a group of mines at Brown's Valley. Work was begun four years ago by Frank Page, in the interest of Charles Webb Howard of San Francisco, after the properties had lain idle since the 50's. The equipment put in was expensive, and the operating expenses, with steam power, heavy. The motive power is now electricity from the Yuba Power Co. The mine is run at a profit. Work begun by Mr. Page at the Donnebroge shaft, near which the 20-

stamp mill is located, has been discontinued, and the ore now all comes from the Pennsylvania shaft, and largely from the Bulldog ledge, which is high grade and dry. A large body of water is caught at the 900 level of the Pennsylvania shaft and is there thrown to the surface by an electrically propelled pump stationed at that level. The ore, after being raised by an electric hoist, is conveyed over an electric tramway 1200 feet to the mill, where the twenty stamps, weighing 1000 pounds each, and dropping 100 times to the minute, crush seventy tons of ore per day. The electric motor furnishing all the power used at mine and mill is rated at 280 H. P., but sometimes carries a load of 350 H. P. The machinery is belted to one side only of the main shaft, which is not an economical power arrangement. The air compressor, which runs six drills in mine, is a second-hand machine rated for sixteen drills. The Pennsylvania shaft follows the ledge, at an angle of 40%, to a depth of 900 feet; 500 feet north of this point a winze has been extended 300 feet into the Bulldog ledge. Drifts north and south from the winze supply most of the ore now being worked. An upraise is being put in to connect with an old shaft near the mill, which latter shaft has recently been cleared out. This will improve the ventilation of the mine. G. Lezinsky of San Francisco is general manager of the Victor properties; C. N. Morse, assistant manager; Naylor Williams, foreman.

The Silent Friend gravel mine is a new enterprise at Brown's Valley. Five residents of the locality, viz.: Naylor Williams, T. J. Hibbert, T. Sutcliffe, Fred Culbert and Dr. G. S. Holbrook, are convinced that an ancient river channel courses through the flat country near the town. Former gravel workings, which proved profitable in their day, lend encouragement to their faith. They are now sinking a vertical shaft about a half mile from the Pennsylvania mine, and expect to go 50 or 60 feet before striking bedrock. They will then drift to find pay dirt. At 20 feet considerable water came into the shaft, and they have rigged up a gasoline engine to dispose of this water flow. Considerable interest centers in their enterprise.

Campbell's gravel mine, at Smartsville, is again one of the active properties of Yuba county. A company, headed by Irwin & Stillwell of San Francisco, has a ten years' lease of the property. The enterprise was promoted by W. Coleman, who retains an interest. They have a permit from the Debris Commission to ground sluice into the canyon below, where a retaining barrier has been constructed, the material of an extensive slide which covers a portion of the blue lead. When uncovered, the lead will be worked from an open pit. There are three strata of gravel in the top ground, which, besides the material of the blue lead, will be disintegrated in specially constructed mills, capacity twenty tons per hour. One of these mills is now working on gravel from a portion of the mine distant from the slide alluded to. Another mill is to be started by the 15th of July. The gravel in question yields several colors in nearly every pan. They say it can be worked for 3 cents per ton, and is thought to be worth 50 cents per ton for the whole mass. The mills will be run by water, under a head of 288 feet. At present, in the ground-sluicing operations 1000 miners' inches of water fall, for four hours each day, over a high bank upon the caved material, and the latter is being gradually sluiced into the ravine through Mr. Campbell's old bedrock tunnel and new conduits. The new Blue Point enterprise has given an old-time activity to Smartsville, and the work is being watched with interest, if not solicitude, by all residents. David Bradbury, a gravel miner of experience, is superintendent. F. B. Simonds will have charge of the mill work. About fifteen men are employed.

Smartsville, May 28.

Supt. Wright, at the Blue Point gravel mine near Smartsville, has a mill with 300-ton capacity which has just started up on gravel paying $1 per ton.

COLORADO.

BOULDER COUNTY.

The Golden Eagle, at Salina, is reported to have opened a 15-inch vein of sylvanite ore in the breast of the tunnel, 300 feet from the mouth. It is expected to run twenty ounces gold.

At Ward, the B. & M. mine shows new strikes. The ore in the east 800 drift runs $148 in gold and four ounces in silver.

Ward Miner: The Nugget Co. is pushing development. The pay streak of ore has widened to 33 feet. The site of the old mill burned has been cleared and graded, preparatory to building a new one. The tramway, 3500 feet in length, is to be repaired.——At the Ward - Rose mine, Mgr. Donaldson is driving the 200 level east and west and pushing the breast of the J. S. tunnel toward the main lead of the property.

CHAFFEE COUNTY.

At the Tasmania mine Mgr. Smith has the ore bins and stopes full awaiting the blowing in of the matte smelter at Winfield.

B. T. Brooks has resigned as superintendent Sedalia mine.

CLEAR CREEK COUNTY.

Regarding the Stanley mine at Idaho Springs, G. J. Riner of Montreal, now at the property, says the mill is to be one of 100 stamps.

At Empire, the Gold Fissure M. Co. is preparing to expend $35,000 on a shaft house and hoisting machinery. The shaft is to be three compartment, 5x15 feet in the clear.

GILPIN COUNTY.

The Rapidan M. & M. Co. have resumed work on the Cœur d'Alene property. Sinking will be continued 100 feet farther.

Joy, Abbott & Baldwin, at the East Whiting mine, have twelve men shipping ore.

At the Mechanic's lode on Gunnell hill, Capt. Bolthoff, of the Hendrie & Bolthoff Mfg. Co., owner of the property, will put up one of his first motion hoisters and a new shaft building.

HUERFANO COUNTY.

At Walsenburg the Grand View, Scantic and the mines on the McMillian property, in the Blanca district, have resumed operations.

LAKE COUNTY.

Leadville's zinc production is increasing. The heaviest producers of this ore at present are the Adams, Moyer, Small Hopes and the Mard. Much of the zinc product goes to foreign countries, and a shipment of about 2000 tons was made last week to the Belgium zinc plant.

Supt. Wallace of the Tasmania M. Co. has taken the men from No. 3 crosscut tunnel and put them to work on the north drift of the No. 2 workings, breaking ore until the surface water lessens.

The Union smelter has closed down, throwing 175 men out of employment.

The Ibex or Little Johnny mine, in the Leadville gold belt, has 86 miles of levels and other openings in the different veins of the group. This is about as extensively developed a property as any in Colorado.

Miner: At Leadville the American Salvage Co. of Kansas City has started up its sludge mill at the President mine at St. Kevin.

LA PLATA COUNTY.

Near Durango, the old San Juan smelter, now in control of the American Smelting & Refining Co., is running four stacks and seven roasters. Arrangements are in progress for doubling its capacity.

LAS ANIMAS COUNTY.

Supt. Dorn of the Abe Lincoln has driven the tunnel into old Baldy mountain 650 feet, gaining a depth of nearly 600 feet, making it the deepest workings in Trinidad.

SAN JUAN COUNTY.

(Special Correspondence). — The Iowa M. & M. Co. have extended their tramway line from the mill to the railroad—a distance of over a mile.

Silverton, May 25.

Silverton Standard: The concentrating of tungsten ores at Cement creek has begun by Voillique & Roulet, who have leased the Fischer mill; they are also dealers in uranium ores, having in the Paradox valley the only paying uranium mines in the locality.

SAN MIGUEL COUNTY.

At the Butterfly-Terrible group, Ophir, a nine days' run of ore netted the company above treatment and transportation charges $1451, besides $430 in concentrates. Three cars of concentrates have been sent to the Durango smelter. D. Sayer is manager of the company.

At Telluride, Mgr. Mercer of the Liberty Bell M. Co. has forty stamps on the San Miguel river in operation. The cyanide plant connected with the mill is satisfactory. The Liberty Bell mines, in Cornet creek, will produce 300 tons every twenty-four hours.

Miner: Near Ouray, the Revenue tunnel is being driven by the Caroline M. Co. The tunnel was driven in two miles from the Ouray side, tapping the vein at a depth of 2200 feet from the surface and giving miles of stoping ground. The shaft was down 1400 feet and an incline was run down connecting the bottom with the tunnel 800 feet deeper. The ore carries values in silver, gold, copper and lead and is run through the 80-stamp mill. Nearly 600 men are employed; 400 tons crude ore are sent through the tunnel daily. H. W. Reed is manager. The Ophir tunnel from the Telluride side of the divide with a length of two miles will cut the formation at a depth of 2000 feet and eventually connect with the Revenue tunnel. The Ophir is now in a mile and a half.

SUMMIT COUNTY.

At Breckenridge the Journal reports the No. 4 Risdon dredge boat of the North American Gold Dredging Co. at work in the Swan river. An Evans hydraulic lift plant will be put at work.

The Augusta M. & M. Co. will drive the crosscut tunnel a further distance of 1000 feet. The tunnel will cut the vein, which was opened in the Juventa shaft, at a depth of 630 feet.

The Jessie is the largest shipper of concentrates in the district, says the Breckenridge Journal. The monthly shipments average about 200 tons. A shortage of water for months has at times prevented the use of the entire forty stamps of the mill, which is said to have a capacity for handling seventy tons of ore per twenty-four hours.

TELLER COUNTY.

(Special Correspondence).—The Clyde, being developed by Detroit parties, has put in a 12x14 steam hoist and an air compressor over their 550-foot shaft.

The Strong management are putting up a new shaft house, gallows-frame and boiler and engine room, which will prepare the way for a larger tonnage.

Victor, May 28.

Local papers say that "New York bankers offer $5 a share for 1,500,000 shares of Portland," and that the directors will increase the monthly dividend to 3 cents a share at the next meeting of the board, June 5.

The Easter Bell Co. is to sink a compartment shaft 400 feet, at a point where the Isabella and Victor veins can be reached with a crosscut.

The Victor mill has a new 400-ton crusher, a 500-ton set of rolls and additional automatic samplers.

An assessment of 15 cents per share has been called for from holders of Anaconda stock. The company owes $112,000, and interest amounting to $17,000 additional.

Cripple Creek reports a strike of sylvanite in the Bernard lease on the Australia, west slope of Beacon hill. In a crosscut of the Standard tunnel, at a depth of 600 feet, 4 inches assay 500 ounces gold to the ton. The property is owned by the Little May G. M. Co.

The Pharmacist mine at Altman has resumed.

IDAHO.

The Big Buffalo Co. is locally credited with intent to put up a 50-stamp mill at Buffalo Hump this summer, and to expend $200,000 in development work before realizing a dollar. This company has purchased thirty-five claims at a cost of $300,000.

KOOTENAI COUNTY.

A. S. Crawford, manager Cœur d'Alene M. & M. Co., in Cœur d'Alene, is sinking on the Sherman and has reached a depth of 250 feet.

OWYHEE COUNTY.

Avalanche: In the War Eagle mines the Tunnel Co. is employing thirty-five men; the tunnel is in 1300 feet.——The Cumberland mill is pounding away on its preliminary run. Machine drill men can find employment at this property.——The Dernier Resort and Red Jacket mines have suspended work temporarily on account of surface water from melting snow. A limited number of good miners can find employment in this camp.

SHOSHONE COUNTY.

At Wallace W. Snyder has agreed with the Golden Chest M. Co. to transfer all his interest in the Paymaster group of claims, Idaho stamp mill and other property in connection therewith for the consideration of $24,305.82. The company now will undertake a tunnel from near the creek level to tap the Paymaster group, Golden Chest and Dora and Katie claims. They have the largest group of gold-bearing quartz ground in the Cœur d'Alenes. The Idaho and both of the old Golden Chest mills will be run. It is the intention to put in a small cyanide plant.

At Wallace the Bimetallic M. Co. has begun on a 550-foot tunnel on its Nine Mile property, a contract for 300 feet having been let.

MICHIGAN.

At Calumet 3000 men are idle owing to a fire in No. 2 Hecla shaft of the Calumet & Hecla mine. The management decided to close down all except the South Hecla and amygdaloid shafts on account of gas from the fire, which has gone to all parts of the Calumet branch and part of the Hecla.

MONTANA.

BEAVERHEAD COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 7,822.485; value, $161,705.11. Silver, fine ozs. (coining value), 253,262.01; value, $327,449.87. Copper, fine lbs., at $16.67 per cwt., 165,719; value, $27,625.36. Lead, fine lbs., at $4.47 per cwt., 1,038,894; value, $46,438.56. Total $563,218.90.

BROADWATER COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 8,262.627; value, $170,803.66. Silver, fine ozs., (coining value), 144,948.35; value, $187,407.96. Lead, fine lbs., at $4.47 per cwt., 1,088,036; value, $48,635.21. Total, $406,846.83.

CASCADE COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 2,128.526; value, $44,000.54. Silver, fine ozs. (coining value), 912,723.21; value $1,180,086.57. Lead, fine lbs., at $4.47 per cwt., 3,810,679; value, $170,337.35. Total, $1,394,424.46.

At Great Falls the smelter branch of the street railway is in operation, and is 8400 feet in length. It cost $250,000.

Montana mine dividends for the first five months of the year are: Amalgamated, $3,000,000; Anaconda, $2,400,000; Boston & Montana, $2,700,000; Montana Ore Purchasing Co., $80,000; Parrot, $345,000; Montana Coal & Coke Co., $60,000; Florence, $22,000. Total, $8,607,000.

Anaconda Standard: The Diamond R. concentrator at Neihart is ready to start. The ore cars will carry four tons each by the gravity system. E. McCool is millman.

DEER LODGE COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 10,349.123; value, $213,935.36. Silver, fine ozs. (coining value), 4,493.37; value, $5809.60. Copper, fine lbs., at $16.67 per cwt., 50,000; value, $8335.00. Total, $228,079.96.

The Standard says the Anaconda C. M. Co. will this month begin to build the largest copper smelting plant in the world, on the foothills east of Anaconda. As a starter, the company advertises for bids for 100,000 cubic yards excavation and 25,000 yards masonry. The concentrator will be 625x349 feet; the roaster building, 98x330 feet; the reverberatory building, 176x408 feet; in that will be fourteen reverberatory furnaces, each 24x60 feet. The blast furnace building will be 82x280 feet; it will contain five furnaces, each 54x180 inches. Coke will be the fuel to produce the copper matte. The converter will be 174x462 feet. There will be 8000 H. P. The capacity will be 5000 tons daily. The plant will be ready about August 1, 1901.

FERGUS COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs, 8,883.774; value $183,643.91. Silver, fine ozs. (coining value), 5380.64; value, $6956.78. Total, $190,600.69.

FLATHEAD COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 802.264; value, $16,584.27. Silver fine ozs. (coining value), 47,380.14; value, $61,259.16. Lead, fine lbs., at $4.47 per cwt., 1,066,199; value, $47,659.10. Total, $125,502.53.

Near Kalispell the Sullivan G. M. Co. had a ton of ore sent to the smelter at Great Falls for a test. The result was the following: Copper, 18.7%; silver, 24.4 ounces; gold, $18.24. The ledge is 3 feet wide; formation granite and slate.

GRANITE COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 7958.448; value, $164,515.72. Silver, fine ozs. (coining value), 1,989,213.53; value, $2,571,912.44. Total, $2,736,426.16.

JEFFERSON COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 7415.708; value, $153,296.29. Silver, fine ozs. (coining value), 887,929.36; value, $1,148,029.88. Copper, fine lbs., at $16.67 per cwt., 25,687; value, $4,282.02. Lead, fine lbs., at $4.47 per cwt., 1,400,880; value, $62,619.34. Total, $1,368,227.53.

LEWIS AND CLARKE COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs, 62,535.675; value, $1,292,727.13. Silver, fine ozs. (coining value), 203,251.90; value, $262,790.33. Lead, fine lbs., at $4.47 per cwt., 500,000; value, $22,350.00. Total, $1,577,867.46.

MADISON COUNTY.

The ore mined in this county during 1899 produced as follows: Gold, fine ozs., 23,708.977; value, $490,108.05. Silver, fine ozs. (coining value), 104,350.74; value, $134,918.12. Copper, fine lbs., at $16.67 per cwt., 40,000; value, $6668. Lead, fine lbs., at $4.47 per cwt., 370,477; value, $16,560.32. Total value, $648,254.49.

The Maggie A. Gibson and Gordon gold dredgers, at the mouth of Alder gulch, have resumed. The largest nugget yet dug up by the boats was a $3 "scad" picked up last week.

MEAGHER COUNTY.

The ore mined in this county during 1899 produced as follows: Gold, fine ozs., 242,857; value, $5020.30. Silver, fine ozs. (coin-

ing value), 150,020.86; value, $193,966.35. Lead, fine lbs., at $4.47 per cwt., 5,000,000; value, $223,500. Total value, $422,486.66.

MISSOULA COUNTY.

The ore mined in this county from placer mines in 1899 produced as follows: Gold, fine ozs., 2749.898; value, $56,845.44. Silver, fine ozs. (coining value), 100.96: value, $130.53. Total value, $56,975.97.

PARK COUNTY.

The ore mined in this county during 1899 produced as follows: Gold, fine ozs., 5883.176; value, $121,616.04. Silver, fine ozs. (coining value), 458.72; value, $593.09. Total value, $122,209.13.

SILVER BOW COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 62,038,377; value, $1,282,447.08. Silver, fine ozs. (coining value), 9,855,831.97; value, $12,742,492.86. Copper, fine lbs., at $16.67 per cwt., 245,245,908; value, $40,882,492.86. Total value, $54,907,833.82.

NEVADA.

LANDER COUNTY.

The Morning Star mine at Dean has resumed operations.

STOREY COUNTY.

Official returns from the Con. Cal. & Va. office of the bullion product of that mine for the month of March, from ore crushed and concentrated at the Kinkead mill, show the amount of ore crushed by the mill was 271 tons and 505 pounds. The Selby smelter's assay value of the concentrates was: Gold, $3797.69; silver at 1.2929, $8200.68; total, $11,998.37; bullion bar assaying $165.04 in gold and silver at 1.2929, $8.92; total, $173.9; total assay value of concentrates, $12,172.33; bullion value per ton, gold $14.60; silver $30.26; total $44.87; assay value per ton per battery samples, gold $16.59; silver at 1.2929, $46.57; total $63.16; yield per cent per battery samples, gold 88; silver 65; aggregate per cent, 71; assay value of the above per ton, shipping value, gold $23.39; silver at 1.2929, $53.99; total $77.38. The concentrates from the above ore and one bar of bullion gained from settlings were sent to the Selby Smelting & Lead Works, whose settlement was: 283 sacks of concentrates, gross weight 21,480 pounds; tare on sacks, 520 pounds; moisture in concentrates, 4%, 838 pounds; total tare, 1358 pounds; net weight of concentrates, 20,122 pounds; contents of concentrates, gold $3797.69, or 183.714 ounces, at $19.50 per ounce, $3582.42; silver $8200.86, or 6342.86 ounces, less 5%, or 317.86 ounces; total 6025.72 ounces, at 59⅜ cents per ounce, $3592.83; total value of contents, $7175.25. The bar of bullion contained, gold $165.04, silver $3.82; total $168.86; charges $1.64; total $167.22. The total gross returns were $7342.47; treatment charges for 10 tons and 122 pounds of concentrates at $11 amounted to $110.67; freight on concentrates to Vallejo Junction, $189.99; total charges, $300.66. The coin received at the San Francisco office was $7041.81. The reduction of the ore at the Kinkead mill, 271 tons and 505 pounds, at $2.50 per ton, amounted to $678.12; hauling and railroad freight on empty sacks, $1.58; hauling concentrates, $8.15; Comstock Tunnel Co.'s royalty on $7342.47 at 4%, $293.69; total charges, $981.54; net returns, $6060.27.

NEW MEXICO.

BERNALILLO COUNTY.

The New Mexican says that scores of prospectors have outfitted at Bland and taken to the hills since the spring season opened. Media Dia, Cochiti and Peralta canyons are going to be thoroughly prospected this summer.

COLFAX COUNTY.

Work is to be resumed on the Golden Era mill at Elizabethtown.

Three shifts are pushing the Blue Bandana tunnel, now in 400 feet.

GRANT COUNTY.

The Volcano mine, Volcano district, is sold to Pennsylvania men for $15,000. It is the intention to commence work this month and build a 10-stamp mill.

The Western Bell property, Gold Hill district, has been leased and bonded to W. G. Meyers of Massachusetts. The option was given for a term of five months; the purchase price is $15,000. The new management began work this week.

LINCOLN COUNTY.

The American Placer Co. is reported to have acquired placer lands, embracing 5000 acres, from the Jicarilla Placer Co. for $350,000. The company will operate with hydraulic and dredging machines at a cost of $100,000.

OREGON.

BAKER COUNTY.

H. S. Sherard, Mgr. Venus Con. G. M. Co., Cracker Creek district, says active development work is in progress on the Venus.

JOSEPHINE COUNTY.

(Special Correspondence). — We have now a postoffice at Greenback mining camp, Alta by name. Supt. Thompson runs the mine and 10-stamp mill, and is postmaster. There are fifty men employed.

Alta, May 25.

Silver State: A suit involving the title to the Gold Bug mine, near Grant's Pass, owned by Jones, Gorham, Lester & James, is decided in their favor at Portland by the U. S. Circuit Court.

UNION COUNTY.

The Northwest Copper Co.'s mine at Iron Dyke was sold last week by the U. S. Court to C. M. Warner of Pennsylvania for $85,000.

UTAH.

BEAVER COUNTY.

The ore mined in this county during 1899 produced as follows: Gold, fine ozs., 1083.716; value, $32,738.32. Silver, fine ozs. (coining value), 244,939; value, $316,688 80. Copper, fine lbs. at $16.67 per cwt., 918,292; value, $153,079.28. Lead, fine lbs. at $4.47 per cwt., 4,983,453; value, $222,760.35. Total, $725,266.75.

CACHE COUNTY.

Near Logan, at the King mine, a carload of ore gave samples showing lead 64%, silver 3.90 ounces, gold .020%, iron 4.8%, zinc 1%, sulphur 8.6%.

CARBON COUNTY.

Coal Mine Inspector Gomer Thomas, from Scofield, tells the Tribune that the camp is gradually taking on its old-time air, and that No. 1 mine will start up again with 200 men. "They will have the safest mine in the world from now on. Every precaution that is known to miners or that money can buy will be used. Among the new rules will be one that six pounds of powder will be the maximum amount that any one miner will be allowed to have in his possession in the mine at any one time."

JUAB COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 44,917.386; value, $918,188.86. Silver, fine ozs. (coining value), 3,329,833.10; value, $4,305,238.75. Copper, fine lbs. at $16.67 per cwt., 3,441,667; value, $573,727.56. Lead, fine lbs. at $4.47 per cwt., 38,080,904; value, $1,702,216.41. Total, $7,499,371.56.

At Eureka N. Dunyon, former superintendent Centennial-Eureka, has arranged for resumption of work at the Tiernan mine. T. Mansfield has been engaged to direct operations.

The strike in the Solid Muldoon claim of the Bullion-Beck gives indication of being a big ore body.

Sylvanite is reported discovered in the property of the Star Con. M. Co., near Eureka.

The properties of the Sioux and Utah mining companies at Tintic have been closed down.

Mgr. Hunt, at the May Day, Eureka, has 3 feet of ore, going 68 ounces gold and 630 ounces silver to the ton.

The Lower Mammoth will ship its low-grade ore to the Salt Lake smelters.

SALT LAKE COUNTY.

The ore mined in this county in 1899 produced as follows: Gold, fine ozs., 8611.360; value, $178,013.03. Silver, fine ozs. (coining value), 201,801.44; value, $260,914.97. Copper, fine lbs. at $16.67 per cwt., 4,145,028; value, $690,976.17. Lead, fine lbs. at $4.47 per cwt., 2,334,731; value, $104,362.48. Total, $1,234,266.65.

B. Sewell, Vice-Pres. American Smelting & Refining Co., says they will build a $1,000,000 smelter, near Sandy, to take the place of the Germania, Mingo and Hanauer plants, which are to be dismantled.

SUMMIT COUNTY.

The ore mined in this county during 1899 produced as follows: Gold, fine ozs., 8803.797; value, $181,990.63; Silver, fine ozs. (coining value), 3,152,329.78; value, $4,075,739.49. Copper, fine lbs. at $16.67 per cwt., 805,347; value, $34,251.34. Lead, fine lbs. at $4.47 per cwt., 41,884,755; value, $1,872,242.55. Total, $6,264,230.01.

TOOELE COUNTY.

The ore mined in this county during 1899 produced as follows: Gold, fine ozs., 106,214.609; value, $2,195,650.83. Silver, fine ozs. (coining value), 225,705.01; value, $291,820.72. Total, $2,487,471.55.

The Mercur mine now employs 125 men.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Homestake cyanide plant at Lead will be 342 feet by 160 feet—the largest cyanide plant in the country—capacity 1200 tons per day. The tailings from the stamp mills retain $1.50 in gold. This loss has been going on for twenty years, and has been carried down the creek and deposited in the shape of concentrates, which have been shoveled out in many places by miners and sold to the smelter for about $12 per ton. The Homestake Co. expects to be able to save about $1.25 out of the $1.50—a saving of $1500 per day.

WASHINGTON.

FERRY COUNTY.

At Republic Manager Lansing of the Republic Reduction Co. says the mill will commence crushing June 1st.

The Tom Thumb mine, Republic, will have $10,000 worth of new machinery this season.

FOREIGN.

AFRICA.

Rhodes, Beit and other men are credited in London with intent to develop mining in German West Africa, within 400 miles of Walfisch bay. C. James, a California miner, will head the prospecting expedition, which, it is announced, will leave England this month.

BRITISH COLUMBIA.

At Quesnelle Forks work on the Cariboo mine is being pushed and quantities of gravel are passing down the flumes.

English capital is to extensively develoo properties on Mount Sicker, Vancouver island, near Horse Shoe bay, 40 miles north of Victoria and 30 miles from Nanaimo. The group includes the Tyee, Herbert and Magic Fraction. The local director is Clermont Livingston of Cowichan Bay; the consulting engineer and metallurgist W. Pellew-Harvey of Vancouver. The latter has prepared a full report of the location and putative value of the property, with maps and sectional drawings.

MEXICO.

J. W. Brill tells Two Republics that "there are many claims being denounced in Oaxaca by Americans and paying well. In the Sierra Juarez, to the northeast of Oaxaca, the banner mine is La Natividad, in which many prominent Mexicans are interested. The peculiarity of this district is that the value of the gold and silver in the ore is almost always nearly the same. On the San Luis river a 20-stamp mill is being erected, to handle more especially low-grade ore. I am interested in La Victoria and La Tapada mines. We have little machinery and we have to freight our ore on burro back 65 miles to a railroad, and then send it to Monterey or to Aguascalientes to be smelted."

SOUTH AFRICA.

The news of the week from Johannesburg and Pretoria is of importance to manufacturers of mining machinery and industrial appliances in general. The occupancy of the Rand by the British of course ends all fear of further "commandeering" or threatened destruction of mining property.

There are about $40,000,000 worth of mining machinery in the Transvaal. Peace and the stimulus of development will doubtless double the amount. In every department of manufacture there will be demand. As an instance may be cited the inevitable demand for wire. The military authorities appropriated every mile of the metallic roping used on the farms for their own use, and it will be necessary to replace that thus taken and as much more.

A government notice had been issued by the Boer Executive to the effect that the bewaarplaatsen or depositing sites on the Rand would be sold by public auction in the Church Square, Pretoria, on June 25, when the conditions of the sale would be made known. The date of the sale was subsequently altered to July 9. This notice covered the disposal of property worth in all probability $8,000,000. Jumpers and Jumpers Deep would be particularly affected by the sale, but other companies which hold the surface rights to these bewaar platsen claims would also suffer severely had the Boers succeeded in their intention of disposing of these rights. In February A. Milner issued a proclamation giving the Boer government notice that all sales and forfeitures effected in the Transvaal subsequent to October 10 would not be recognized by England.

However, the events of the week render nugatory the proclamation.

The London Mining Journal says: Several of the Rand mining companies, especially of the deep level group, have within the last week or so published their annual reports, from which we are able to gather the value of the gold which the Government of the Transvaal have appropriated or commandeered up to the present time, although it does not follow that this represents, by any means, the whole extent of their depredations. The following table will be studied with interest:

Company.	Approximate value of gold seized.
Goldenhuis deep	£37,200
Rose Deep	30,450
Jumpers Deep	23,950
Ferreira Deep	22,900
Langlaagte Deep	19,950
Crown Deep	16,350
Glen Deep	15,200
Nourse Deep	14,850

Thus giving a total of £180,850 taken up these various deep level mines. In addition, the following sums have been commandeered: From the Robinson (£39,900), Sheba (£8572) and Jubilee (£4985), which brings the total value of all the gold seized, as far as is known up to the present, of £234,307. It is more than probable, when the particulars come to hand, that we shall find double the amount has been commandeered from these and other mines.

The directors of the Durban-Roodepoort Deep have issued an interim report for the fifteen months ended March 31, 1900. The mine was closed down on October 5, so that the report covers only nine working months. The estimated profit for this period was £39,660, and it is estimated that, after deducting costs incidental to the war, the company's cash and cash assets, as at the end of December, 1899, amounted to £25,747, inclusive of the cash seized by the South African Republic. Full details of working results are shown only for the six months ended June 30, though for the succeeding three months some particulars are furnished from incomplete returns. The total quantity of rock crushed in the first half of the year was 52,169 tons, and this yielded 20,923.3 fine ounces over the plates and 9555.9 ounces from cyanide works, giving a total result of 30,479.4 ounces, equal to 116 dwts. per ton. The value of the ore per ton was £2 8s. 9d., and after deducting working expenses the net profit per ton stood at 9s. 10d. The total quantity of ore crushed in July, August and September was about 26,609 tons, giving a total yield of 15,724.1 fine ounces, equal to 11.8 dwts. per ton. The working profit per ton during the latter three months is estimated at 12s. 9d. or, 2s. 11d. more than during the first half of the year. The mine was in good working condition when closed down, and the ore reserves are stated to have been very satisfactory.

At the outbreak of the war, in October, the total output of gold in the Transvaal for 1899 was 4,134,180 ounces, valued at £14,707,906. In consequence of the period covered by these figures not being a whole year, any comparison with the previous year's output would be misleading, but it may be stated that the actual output for the nine months—January to September—showed that the progressive annual increase in the gold production of the Witwatersrand was well maintained, and that, had there been no interruption in the work at the mines, the total this year would have considerably exceeded that of 1898. The total production of gold on the Rand since the commencement of mining operations amounts to 22,477,544 ounces, worth nearly $400,000,000. With British dominance will come increased development of the entire region.

Personal.

F. RAINVILLE is Supt. Federal M. Co., Columbia, Cal.

B. C. STANNARD is now Supt. Everett, Wash., smelter.

E. A. WILTSEE has returned to San Francisco from Denver.

W. S. ROTHERMEL is examining Camp McKinney, B. C., property.

J. R. CESSNA succeeds A. C. Purdy as Supt. Pinal, Arizona, M. Co.

C. D. AKERS is now Supt. Hidden Treasure mine, Centerville, Cal.

MGR. SALKLY has resigned at the Forman tunnel, near Willcox, Arizona.

J. M. ANDERSON is at Lardo, B. C., to take charge of the G. H. E. & D. Co.'s operations.

W. PELLEW HARVEY of the Tyre Copper Co. has returned from London to Vancouver, B. C.

F. F. SHARPLESS has resigned the superintendency of the Cal. Copper Co., Madera, Cal.

L. I. OGDEN is at Graniteville, Nevada Co., Cal., putting up a 20-stamp mill for the Erie M. Co.

J. G. HOPPER goes to London to form a stock company to operate the Soulsby mine, Soulsbyville, Cal.

R. S. MOORE of the Risdon Iron Works, San Francisco, has gone to Honolulu with a $100,000 pumping plant.

HERMAN C. BELLINGER has been appointed manager Montana Ore Purchasing Co.'s reduction works.

E. C. FENNER, Supt. Lowell & Arizona C. M. & S. Co., has returned from Sonora, Mexico, to Bisbee, Arizona.

V. Z. REED, who helped engineer the sale of Stratton's Independence to the

Venture corporation of London, has returned to Denver from a two-month's visit to London.

JAS. HICKEY will have charge of the new mining operations on the Comstock M. Co.'s property, Park City, Utah.

W. A. CLARK and F. Aug. Heinze of Montana have formed an alliance, offensive and defensive—an important coalition.

W. L. WATTS, Cal. State Mine Examiner, was last week examining prospective oil land at Del Mar, San Diego Co., Cal.

RALPH BAGGALEY and A. C. Kingsbury, mining men of Loomis, Wash., are viewing Calaveras county, Cal., mining properties.

F. O. SMOLT, formerly at Aspen, Colo., has purchased the assay office of W. F. French at Independence, Cripple Creek district, Colo.

E. W. WALTER has returned to Silverton, Colo., from Mexico, and will act as assayer and chemist for the Kendrick-Gelder Smelting Co. at Silverton.

H. A. CLAPP, president of the Rex Investment Co., Cripple Creek, Colo., has returned from Sonora, Mexico, where he is developing some mining properties.

W. S. KEYES of San Francisco is in Salt Lake City, Utah, in connection with mining litigation. He will be unable to attend the Milwaukee Mining Congress.

AUSTIN H. BROWN, formerly of Butte, Montana, has arrived at Redding, Cal., where he will have charge of Capt. De Lamar's Shasta Co. mining and smelting interests.

STEPHEN RAYMOND of Butte, Mont., is locally credited with a journey to Pilot Point, San Francisco bay, to superintend the construction of the Silver King M. Co.'s new smelter.

FORBES RICKARD of Denver, Colo., and Col. Wolnoralsky leave San Francisco next week for northwest Siberia, where the Venture Co. of London have secured a gold mining concession.

W. W. DAILY of London, Eng., and G. O. Bradley of Spokane, Wash., are in San Francisco in connection with their Fresno, Cal., copper property and their projected smelter near Martinez, Cal.

D. H. JACKSON, late of El Dorado Co., Cal., leaves San Francisco to-day on the San Jose for Cape Nome, representing the Russian syndicate that has concessions on the Siberian coast. A Russian man-of-war will meet him at Nome July 1st to convey him and party to the Siberian side, where extensive exploitation is contemplated.

A. H. BROOKS is in San Francisco preparing to collaborate with his colleague, F. C. Schrader. Both are members of the U. S. Geological Survey and have already made a preliminary government report on the Cape Nome country. They now go to the Copper river country. Mr. Brooks will meet Mr. Schrader at Seattle, Wash. They will spend 1901 in the Koyukuk country.

Commercial Paragraphs.

THE Empire Foundry, Marysville, Cal., is shipping a No. 5 hydraulic monitor, with appurtenances, to a gravel mine at Hoki Taka, New Zealand.

T. L. WILKINSON of Denver, Colo., is superintending the construction of an additional power plant for the Silver Lake mines and mill, near Silverton, Colo. It consists of a steam plant for the generation of electricity, the latter to operate motors at various points required at mine and mill.

THE Taylor Iron & Steel Co., High Bridge, N. J., is filling a large contract for steel wheels to be used on the sugar plantations in the Sandwich Islands. They will be shipped around Cape Horn to San Francisco and consigned to the Hawaiian Commercial & Sugar Co., Kahalui, Hawaii.

THE Ingersoll-Sergeant Drill Co., New York, had all its air compressors at the Paris Exposition erected and ready to run on the opening day, being the first American exhibitor to operate and the first exhibitor from any country to run its exhibit by steam. John J. Swann, late associate editor of Engineering News, is in charge of this exhibit.

JEANESVILLE IRON WORKS CO., Denver, Colo., A. Middlebrook manager, report contract from the Rialto L. & M. Co. for compound condensing pump, capacity 900 gallons per minute, 1000 feet high, fitted with Corliss steam valves for economy of fuel; stroke of pump 3 feet, condenser duplex pattern. They have also sold Bassick Mine Co. of Silver Cliff, Colo., duplex pump, 900-foot lift.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 22, 1900.

649,913.— EXPLOSIVE COMPOUND — S. Clark, Gold Hill, Ogn.
650,301.—PASTE BOTTLE—G. P. Cragin, Spokane, Wash.
650,302.—PASTE BOTTLE—G. P. Cragin, Spokane, Wash.
650,303.—GRATER—E. Crupe, S. F.
650,308.—CAMERA—T. J. Demorest, Garfield, Wash.
650,043.—RAZOR—F. W. Gotterke, S. F.
650,354.—ICE TANK FLOOR—Graham & Pierce, Sacramento, Cal.
650,147.—UNDER REAMER—E. A. Hardison, Santa Paula, Cal.
650,317.—DUMPING BARTER — E. A. Hardison, Santa Paula, Cal.
650,318.—CASING PERFORATOR — E. A. Hardison, Santa Paula, Cal.
650,077.—PIPE WRENCH—W. T. Hatten, Canyon City, Ogn.
650,320.—PUZZLE MAP—W. Hepfinger, Montesano, Wash.
650,148.—SKIRT SUPPORTER—W. Hill, Los Angeles, Cal.
650,046.—INKSTAND—P. D. Horton, Oakland, Cal.
650,323.—BUBBLE BLOWER—P. D. Horton, Oakland, Cal.
650,324.—BUBBLE BLOWER—P. D. Horton, Oakland, Cal.
650,263.—CYLINDER COCK—L. M. Morrow, Wasco, Ogn.
650,081.—FENDER FOR CULTIVATORS—W. P. Murphy, San Jose, Cal.
649,946.—SAWMILL CARRIAGE—H. Newton, Centralia, Wash.
650,083.—WATER HEATER—Pattison & Barlow, San Luis Obispo, Cal.
650,114.—REMOVING SURPLUS METAL FROM COATED ARTICLES—G. Porter, S. F.
650,138.—CONCENTRATOR—C. A. Smith, Los Angeles, Cal.
650,283.—LOGGING MACHINE — E. Turney, Los Angeles, Cal.
650,057. — ELECTRIC CIRCUIT CONTROLLER—A. L. Waters, S. F.
650,286.—ROTARY ENGINE—W. W. Watkins, Yuma, Ariz.
650,070.—CRIBBAGE BOARD — R. Whitman, Oakland, Cal.
650,289.—SOLDERING MACHINE—Winsor & Smith, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR REMOVING SURPLUS METAL FROM COATED ARTICLES.—George Porter, San Francisco, Cal. No. 650,114. Dated May 27, 1900. This invention relates to an apparatus which is designed for the cleansing and preparation of nails which have been previously coated with molten zinc or equivalent protecting metal and which process is technically called "galvanizing." The object of the invention is to provide a mechanism and apparatus by which the surplus fused metal adhering to the nails can be cleaned off and the nails left in a smooth and merchantable condition. It comprises a cooling chamber with beaters, an inclined revoluble spirally ribbed cylinder and a directing board by which the articles are delivered from the first chamber to the cylinder, a shaking separating screen upon which the articles and separated particles are received, a collecting floor and discharge for the metal beneath the screen, a second screen upon which the nails are delivered, and an air blast and spraying device for cooling them as they pass over the second screen to the point of delivery.

DRYING APPARATUS.—C. R. Splivalo, San Francisco. Cal. No. 649,648. Dated May 15, 1900. This invention is designed for purposes of drying alimentary pastes, such as macaroni, vermicelli and the like. It consists of a vertically journaled and stepped center post, bars secured across the post at top and bottom and at right angles with each other, exterior frames fixed to the ends of the bars united at the corners to form rectangles, with vertical connecting bars, horizontal supporting bars secured thereto and trays adapted to contain the material to be dried, said trays being supported upon the horizontal bars and having their inner and overlapping spaced bars at the center of the structure which support these overlapping ends. Suitable mechanism is provided by which the structure is revolved upon its vertical axis so that the trays are constantly moved through the air in horizontal planes, and this continually furnishes sufficient dry air to take up the moisture and carry it outward away from the trays.

Recently Declared Mining Dividends.

Southern Boy Co., Colorado, 2½ cents per share	June 10
Osceola M. Co., Michigan, $3 per share	June 22
Boston & Montana Co., regular quarterly dividend $5 per share, extra—the largest dividend at one time by the Boston & Montana, calling for a disbursement of $1,500,000; total dividends to date aggregate $17,225,000	May 29
Home M. Co., Colorado, $25,000	June 1
Lake City L. Co., Cripple Creek, Colo., 7½ cents per share, $3785	May 31

"Extraction Was Satisfactory and Rapid."

THE PENNSYLVANIA MINING & MILLING CO.—MANAGER'S OFFICE.
BOULDER, COLO., April 25, 1900.

The Pneumatic Cyanide Process Co., 306 Boston Building, Denver, Colo. GENTLEMEN—We have now completed the large 16-foot tank, which we put in according to your plans. We have made numerous tests, which we have found to be satisfactory. On the last run made, we put the tailings, or ore, in the vat to the depth of 4 feet, making about thirty-two tons. We found that the air worked very well, distributing over the surface evenly, and that the extraction was satisfactory and rapid, doing in seven hours what it formerly took from forty-eight to ninety-six hours to do.

Yours truly,
THE PENNSYLVANIA M. & M. CO.
By B. R. Petrikin, Mgr.

Latest Market Reports.

SAN FRANCISCO, May 31, 1900.

SILVER—Per oz., Troy: London, 27⅝d (standard ounce, 925 fine); New York, bar silver, 60c (1000 fine); San Francisco, 60c; Mexican dollars, 49½c.

COPPER.—New York: Lake, 1 to 3 casks, 16.50 cash; carload lots, 16.25; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.00; Casting, 1 to 3 casks, 16.12½; carload lots, 16.00. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $3.97½; Salt Lake City, 3.90; St. Louis, $3.95; San Francisco $4.90, carload lots, 5c 1000 to 4000 lbs.; pipe 7, sheet 8, bar 6c. London, £16 17s 6d = 3.67½c per lb.

The schedule of prices issued by the American Smelting & Refining Co. is as follows:

Delivered.	Desilverized.	Corroding.
St. Louis	$3 95	$4 05
Chicago	3 95	4 05
Cincinnati	4 00	4 10
Pittsburg	4 05	4 15
Philadelphia	4 05	4 15
New York	4 00	4 15
Boston	4 07½	4 17½

SPELTER. — New York, $4.45; St. Louis, $4.55; San Francisco, ton lots, 6c; 100-lb lots, 6c.

ANTIMONY. — New York, 10c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 1, 10c.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 40@45c ℔ lb.

IRON. — Pittsburg, pig, No. 2, foundry, $21.50; gray forge, $20.00; San Francisco, bar, per lb., 3c.

STEEL. — Billets, Pittsburg, $29.50; sheet bars, $34; San Francisco, bar, 11c to 18c per lb.

QUICKSILVER. — New York, $51.00; London, £9 10s; San Francisco, local, $51.00 ℔ flask of 76½ lbs. Export rates withdrawn.

BISMUTH.—New York, ℔ lb., $1.70 50-lb lots; San Francisco, $2.50 to $2.75 lb lots.

PLATINUM.— San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

MAGNESIUM.—New York, $3.00 ℔ lb.; San Francisco, $4.00.

ZINC.—San Francisco, 6c; slab, 6½c; bar, 8c.

SOLDER. — Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17c.

TIN.—New York, pig, $28.75; San Francisco, ton lots, 31½c; 1000 lbs., 32c; 500 lbs., 33c; less, 34c; bar tin, ℔ lb, 37c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ℔ set; 14 oz., 40s., 10½c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 33@35c ℔ lb.; carloads, 31@32c; in 10-lb. tins, 40c; sulphuric acid, 66% B, 2c ℔ lb.; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

SMOOTH-ON CASTINGS.

TRADE MARK

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT.

CAPACITY FROM 5 TO 10 STAMPS.

GEORGE E. WOODBURY,

THE BLAZED PATH

IS A GOOD ONE TO FOLLOW.

The money-making manufacturers advertise in this paper with most successful results. Results are what count.

You can buy advertising space for less money elsewhere, but you can't buy a CHEAPER advertisement. Cheapness is not regulated by what you pay, but by what you get for what you pay.

In the MINING AND SCIENTIFIC PRESS you reach over 30,000 probable customers fifty-two times a year.

330 MARKET ST., SAN FRANCISCO, CAL.

Mines of Sultan Mountain, Colo.

With commendable and characteristic enterprise the Standard, of Silverton, San Juan Co., Colorado, has published a picture of Silverton and Sultan mountain, which is herewith reproduced. To such papers Colorado is largely indebted for its pre-eminence in gold production.

Time was when that region of Colorado was called "the silvery San Juan: it is now fitting to refer to it as the golden San Juan, for, though excelled and overshadowed by Cripple Creek district, yet that section of the State has contributed largely to Colorado's gold product.

Renewed interest is manifested in the section around Silverton by the present projects of the Sultan Mining & Smelting Co., which proposes to utilize the Animas river in generating electric power, a 5-mile flume, with a 400-foot head being contemplated to furnish 20,000 H.P. for local mine and mill use.

There are several properties that it is proposed to consolidate under one management, and work by modern methods; that is to carry on the business of producing gold as a business, intelligently and economically.

There are many active producing properties in the several districts of San Juan Co., at an altitude of from 10,000 to 14,000 feet. There are over 12 miles of aerial cableway. There are almost as many miles of tunnels and crosscuts, and the "staying" qualities of the deep mining carried on by the Empire Con. M. & M. Co., demonstrate the permanence of the ore. At Silver Lake, Gladstone, and other points in the county are important mines. The region is reached by the Denver & Rio Grande Ry. The mountain portrayed is 13,336 feet high.

SILVERTON AND SULTA

RISDON IRON WORKS,

SAN FRANCISCO, CALIFORNIA.

Cable: "Risdon's." Code: A. B. C. & Leiber's.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE RISDON HAMMERED SHOES AND DIES.

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

RISDON IRON WORKS, San Francisco, Cal.

OUNTAIN, COLORADO.

Boilers With Too Much Heating Surface.

An interesting illustration of the well-known fact that a boiler can have more heating surface than is good for it was cited recently by Dr. Coleman Sellers in a lecture before the Franklin Institute. When the first large engines and boilers for the water works of the city of Philadelphia were installed many years ago, it was found, upon test, that the boilers were insufficient for their purpose.

Oliver Evans, who had designed the engines, had specified the length of the grate bars and the width of the furnace to be used, as also the length of the boilers, which were of the plain cylinder type; but the wise men of the city government believed that they could do better by making the boilers much longer than he had suggested, and they were so constructed. Upon their failure to do the work, Oliver Evans was sent for in haste to correct the difficulty. His message to those in charge, enforced by his presence afterwards, was that they must cut off 10 feet from the length of each boiler.

This seemed a strange proceeding, but he soon explained to them that the extra length which they had added to his prescribed dimensions was acting as a condenser to reconvert steam into water, inasmuch as the heat of the furnace could not extend the whole length of the boilers as they had been built.

Upon cutting the boilers down to their proper size so the heat could extend over the whole fire surface, they proved sufficient for their work, and continued to operate as long as this primitive water was in existence. —Cassier's Magazine.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

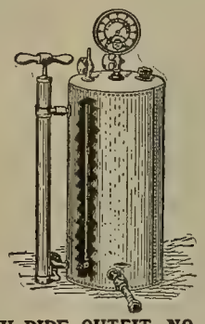
CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.



Estimates made for complete Steam Freighting Outfits. Address

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

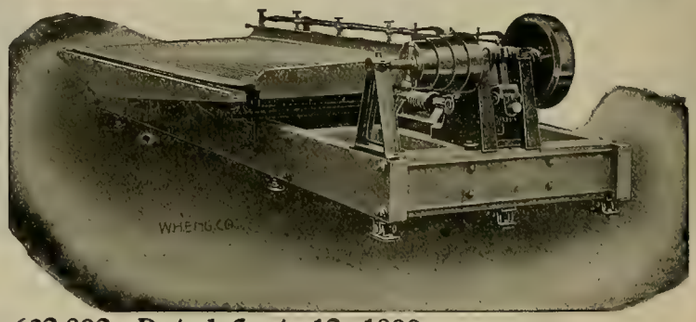
Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.



(SEE PAGE 622.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

DOUBLE CYLINDER SINGLE DRUM HOIST.

MINING AND MILLING MACHINERY.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Mining and Metallurgy.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POSTPAID. Following is a partial list:

ASSAYING, AARON'S — PART I — GOLD AND SILVER ORES:
Fourth edition; Rewritten and Improved; 130 pages, illustrated.....$1

ASSAYING, AARON'S—PARTS II AND III:
Third edition; Revised and Rewritten. Now ready; new type; new illustrations; new matter; better than ever; reduced in price.....$1 50

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. Well illustrated. Cloth.....$2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. M. C. Ihlseng. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated.....$5

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall.....$2

CYANIDE PROCESS:
Practical Notes on: Bosqui.....$2 50

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

PROSPECTOR'S FIELD BOOK AND GUIDE:
4th edition, just out. By H. S. Osborn.....$1 50

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall.....$2

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus.....$3

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, etc.....$5

MINERALOGY:
Brush & Penfield, revised edition.....$4
Dana, New System.....$12 50
Dana, Text Book.....$4
Dana, Mineralogy and Petrography, 12th edition.....$2

HYDRAULIC AND PLACER MINING:
E. B. Wilson.....$2

TUNNELING:
Blasting, Timbering, Air Drilling, etc.; 1000 illustrations; Drinker, 3rd edition.....$25

ALLOYS:
Thurston, 2nd edition.....$2 50

ASSAYING:
Furman, 5th edition, just ready.....$3

LIEBER'S CODE:
Bound in leather.....$3

METALLURGY:
Eggleston, Silver, Gold and Mercury, 2 vols.$15

CHLORINATION PROCESS:
E. B. Wilson.....$1 50

GOLD ORES:
Treatment of; O'Driscoll.....$2

HIGH EXPLOSIVES:
Eissler.....$4

HYDRAULIC GOLD MINING:
Kirkpatrick.....$1

MINERALS:
"How to Study Them," Dana, 2nd edition. $1 50
Dana, American locality of mineral, 6th edition.....$1

GEOLOGY:
Emmons.....$1 50
Le Conte, revised edition.....$4
Dana, 4th edition.....$5

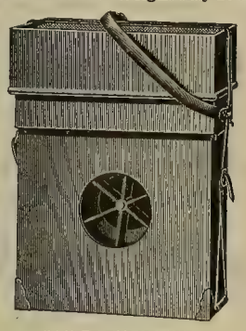
COLORADO'S GOLD



Output for 1899 is unequaled by any State in the Union. Cripple Creek, Leadville, and all the important mining towns are reached by

THE COLORADO & SOUTHERN RY...

For copies of our publications on the Swandyke and Pine Creek Gold Districts, or our pamphlet "Hints to Prospectors," address

T. E. FISHER, GEN. PASS. AGT., DENVER, COLO.

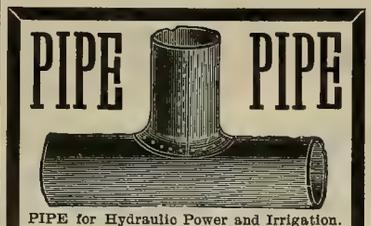
NO MORE PACKING DIRT TO WATER.
— THE —
PNEUMATIC PROSPECTOR.
Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.
Weight 160 lbs.



Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

PIPE for Hydraulic Power and Irrigation.
OIL STORAGE TANKS.
GENERAL SHEET IRON WORK.
Lacy Manufacturing Co.,
LOS ANGELES.

THE LITTLE ALASKA GOLD WASHER.
Price $6. Saves the Gold. Weighs only 7 1-2 Lbs.

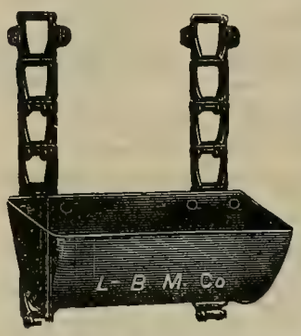
After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

Michigan College of Mines.

An Engineering School with unique location, giving unusual facilities. Distinctive methods of instruction. Special courses given. All work in charge of widely experienced men. Catalogue giving list of graduates and their occupations on application. Address F. W. McNAIR, Prest, Houghton, Pa.

The "Stop for Repairs" to Mining Machinery,

Especially if it is a conveying plant, is a considerable item of expense. Many of these expensive pauses are made to repair or adjust faulty belting. To economize in this respect, use the



LEVIATHAN CONVEYOR BELT.

It is not only adapted to the heaviest service, but will run under any conditions in underground, drippings, extreme heat or cold.

IT WILL OUTLIVE ANY OTHER BELTING.

ASSESSMENT NOTICES.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of May, 1900, an assessment (No. 5) of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 11th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—213 Jackson street, San Francisco, Cal.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of May, 1900, an assessment (No. 3) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 310 Pine street, room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of July, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—310 Pine street, rooms 36, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of May, 1900, an assessment (No. 25) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 21st day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 23) levied on the 2nd day of April, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

∴The Two Essentials.∴

The two essentials for a successful engine are Steam and a **Detroit Lubricator.** The steam furnishes the necessary energy and the **Detroit Lubricator** insures that almost all of this energy will be converted into useful work—not wasted in overcoming friction. We make different styles of lubricators to meet the different conditions existing in the various types of engines, so that all are enabled to work at their best and waste and wear are reduced to the minimum.

Our new catalogue is just out. It describes our full line of **Sight Feed Lubricators, Glass and Brass Oil Pumps, Glass and Brass Oilers, Multiple Oilers, Oiling Devices, Valves, Etc.,** and it will be sent to any part of the world on application.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on th[illegible]ge, is a machine of improved design for [illegible] automatic feeding of ores to stamp batte[illegible]s and other crushing machinery. It is [illegible]erfectly adjustable while in operation, a[illegible]d will feed equally well ores wet or dry, co[illegible]rse or fine.

Shipping weight, with wood[illegible] ame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

AND PACIFIC ELECTRICAL REVIEW.

No. 2081.—VOLUME LXXX. Number 23. SAN FRANCISCO, SATURDAY, JUNE 9, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Zinc Mining in Missouri.

On page 640 is an extended account of zinc mining now in progress in the vicinity of Joplin, Mo., illustrated on this page. The close of the South African war and the renewal of more active operations in the Transvaal mines means more market for zinc, as elsewhere, and the subject is of present interest. The origin of the zinc ore around Joplin is deemed due to differentiated solution by the agency of water. The zinc bodies follow channels traced out long ago by subterranean watercourses. The original formation was composed of limestone, chert or flint, and zinc, the zinc being mainly diffused throughout the limestone. By the water's action the limestone has been dissolved and the chert and zinc have fallen together, the surface of the earth undoubtedly sinking in the process sometimes to a depth of some hundred feet. The zinc sulphide, as left by the vanished limestone, sometimes occurs by itself in great purity, and in other cases is mixed with the chert in a brecciated formation. Often the action of the water can clearly be traced in cavern-like formations, leaving a vault-topped body of zinc enclosed by surrounding chert. The shape and extent of the ore bodies vary according to the course of the underground water. Sometimes there is a very thick and narrow vein vertically; again the zinc is spread in a wide, thin layer. Often such layers are superimposed in considerable number, with intervening strata of earth and chert. The ore itself is of remarkable richness, owing to the close concentration by the water's action. It assays in many of the Joplin mines as high as 60%. Two hundred feet is still considered "a deep shaft."

Grubstaking.

The validity of that form of prospecting contract known as grubstaking has been repeatedly upheld by the courts. The word itself has no double meaning about it, and like most mining terms, indicates exactly what is intended—viz.: a partnership between those who furnish money and supplies to him who is thus enabled to look for and find mining prospects, each to share in the profits or successes as agreed. It isn't exactly a "partnership," it is a sort of venture, or adventure, where one furnishes the grub and stakes the other who supplies the sabe. Though the agreement is not required to be a written one, each party to it justly expects the other to do all that he agrees, and, usually, the responsibility ceases there. When the prospector locates a mine comes a question of tenancy in common, with all its attendant rights and responsibilities. If during the time agreed upon the prospector finds anything and locates it in his own name, his associate, the one who grubstaked him, can claim and enforce compliance with the terms of the agreement, not on the basis of a partnership, but according to the terms of the contract. If during the life of the contract the outfitter fails to keep his part of bargain such failure at once absolves the prospector from further observance of its provisions. And, at the same time, during the life of the contract, either of the two parties to it can buy or sell mining claims with his own money and at his own risk without the other having anything to do with it in any way.

All this applies to the grubstake, pure and simple. That is about as far as a grubstake contract usually goes. If a man is hired to get a mine, and is paid wages from the start, with a promise of a raise in his pay or an interest in what he may acquire, that is not a grubstake, and the relations between the two are those of employer or employe. Any agreement extending beyond discovery and location takes the grubstake contract into a different domain, and makes it more of a mining partnership. So far as property rights are concerned, in the ordinary grubstake contract both parties are merely tenants in common in whatever property may be acquired while the agreement was in force, and neither party has the right to bind the interest of the other.

There isn't much style about grubstaking, nor are there any frills on it; it is a homely proposition with plenty of hard work and a certain amount of old-fashioned honesty and integrity about it, a mutual risk in which each party gives the other a square deal, and neither is supposed to be trying to get the best of it. Some of the best mining property in the United States is the result of grubstaking a prospector, and in these days of scientific mining and metallurgy the prospector is as important a factor as ever, and grubstaking may well be as favorably considered as ever it was. Grubstaking is a good investment to-day; it was always a favorite form of procedure with mine operators always on the lookout for new properties, prospects susceptible of being made into mines—for mines are made just as any other manufacture—and deserves consideration. Not every prospector is fit to be grubstaked; not every man a prospector would care to take a grubstake from; yet there are many prospectors who, backed by coin, could make the venture one of mutual profit.

Second-Hand Machinery.

"What do you think of buying second-hand machinery?" is a question asked this week by a Denver inquirer, and one deemed worthy editorial note. As nothing in the inquiry is specific, the question being a general one, the answer will be equally so. Speaking abstractly, it is better not to buy second-hand machinery that is old and badly worn; so that, briefly, our advice would be, "Don't." But there are numerous qualifying attendants, and the subject deserves extended notice.

"Second-hand machinery" is a term susceptible of very wide and different meanings. As soon as a machine is set up or once used it is "second-hand." If in use twenty years it is still "second-hand." Much, too, depends on the kind of machine. There are machines made twenty years ago that are still worth using, but in the vast majority of cases the newer the style, the more recent the make, the better it is likely to be. Then, too, it depends greatly on what the machine is to do, for what purpose it is to be used. If it be in any department of mining, our advice would be most emphatically to buy no old second-hand machinery. As noted, the term is an elastic one; for a variety of reasons a man may have for sale a whole, complete modern mining plant that he bought last month, and installed last week, and only used three days. If our inquirer could get all or part of it that he wanted, and it would serve his purpose, at a price considerably less than it cost the first owner, it would be a good buy. If, on the contrary, he were proffered some wheezy old concern that had been usurping the place of a necessary modern piece of mechanism around the mine, for years, he would do well to refuse it as a gift. In this as in all things circumstances control and determine. One thing can be said with emphasis. The idea in all business purchases of machinery is economy—not stinginess or close dealing, but true economy, which is only another name for intelligent expenditure of money.

There has been great advance in machinery. In some big concerns the managers find it to-day economy to throw out machines costing $100,000 ten years ago, cast them if necessary into the scrap heap, and put in a new outfit, if they want to keep up with competing concerns who have up-to-date machinery, and who can consequently make their product for less and sell it for less than the establishment that has the old-style machine. This is real economy—to spend $100,000 if necessary rather than be forced out of business by up-to-date competitors. Big users of machinery no longer ask, "What is that man earning?" the question now is, "What is that machine earning?" and if it isn't earning what it ought it is thrown out. The man that buys such "second-hand" machinery may have special use for such abandoned mechanism—if not, he is not up-to-date himself.

In gold mining it is somewhat different. Miners have the advantage of manufacturers; they have no competition; a gold miner doesn't care whether the mine next to him is in bonanza or borasca so far as rivalry or market is concerned. It makes no difference to him whether the other mines in the district are producers or not; he gets just the same for his product. The gold miner has to study no markets, no freight rates, no acts of competitors. Hence, he can view the question of buying second-hand machinery from a safer standpoint, and can experiment a little. What would be fatal to a manufacturer would be a question for him to consider.

In conclusion, it may be said that as between a low price for an old machine and a high price for a new one, good economy would choose the new machine every time. It would be the cheapest in the end. "Cheap" is a relative term. A business man managing his business on sound lines can not afford to buy "cheap" things, for in the long run, or the short run, they prove to be the dearest.

Importance of Analytical Work.

The chemist is an important man these days in every large establishment where analysis of material is a necessary part of the mechanical routine, and the number of such establishments increases as the economy of such analysis is more understood. Time was when the chemist was looked upon as an expensive luxury, or as a theoretical enthusiast, tinkering with alembics and blowpipes, amusing himself in dilettante leisure. Now he is a hard-headed matter of fact business adjunct of manufactures.

What was once puzzling or deemed unavoidable is now made easy of solution. The work of the analytical chemist is now of the highest commercial value, creating new products and diminishing the cost of production. Every problem in chemistry has essential relation with public utility, with the advance of general wealth. The field is so broad, the amount of unoccupied ground so great, the opportunities so abundant, that, in whatever lines the analyst's tastes suggest or force of circumstances leads him, he finds something worth doing and which, well done, leads to honor and profit.

The theoretical chemist may think that his work is on a higher and nobler plane than that of the patient analyst who constantly keeps in view the commercial aspect of the work, but so that the work be congenial there is enough domain of chemical science for willing workers in every field.

The chief charm in analytical chemistry is its power to explain difficulties, to make clear the why of much that is mystifying in daily practice. The old rule was that when anything went wrong the weak line in the chain of circumstances was hard to find. Now in ordinary manufacture the analytical chemist can quickly find and correct the cause of failure in the desired result.

Mr. C. B. Dudley illustrates this ability of an analysis to explain difficulties. In a big factory was received about fifty sheets boiler plate, two of which gave difficulty in flanging—in bending over the edges of the sheets while hot, nearly at right angles to the balance of the sheet, to enable it to be joined to other sheets in the boiler. The two sheets cracked in the bend, the other forty-eight worked all right. The workmen were proficient, the shop practice was good, and the cause of the failure in the two sheets was not apparent. The analytical chemist analyzed samples from each of the two sheets and found they showed 0.35% and 0.36% of carbon, respectively, while analyses of samples from other sheets in the lot of fifty showed in no case above 0.12% to 0.15% carbon, giving immediate explanation. The shop had long been supplied with the softer grade of steel and the shop practice was applicable to that kind of steel. Naturally with the harder grade difficulty arose, continuance of which analysis made unnecessary.

THE American Steel & Wire Co. has cut loose from the Federal Steel Co., and will soon be in position to supply its own raw material. The former had contracted to take about 3000 tons per day of billets and rods at present loss, and some time ago offered to pay the Federal Steel Co. $5 per ton on undelivered material to be released from the contract, which has till Sept. 1st, 1900, to run. The offer was refused, whereupon the combine completed arrangements to cease paying toll to its big brother trust, and after the date named will be independent of such arrangements by securing the ore, the smelters and the manufacture of rods and billets for itself. From Jan. 1st, 1899, to April 1st, 1900, the American Steel & Wire Co. earned nearly $17,000,000 net, and can stand a little depletion.

THE price of lead is not likely to recede further. The steady demand and consumption warrant sustaining the price apart from stock speculation and the variable nature of trust management. The question is of prime importance to Cœur d'Alene, Utah and British Columbia miners.

Concentrates.

A COMPLETE technical description of the bromine extraction process appeared in the issue of Feb. 10, '98.

THE greatest depth ever attained on the Comstock, Nevada, was in the North End, in the Union Con.—3350 feet in 1883.

DOUBLING the diameter of a pipe increases its capacity four times. Friction of liquid in pipes increases as the square of the velocity.

THE land department has no jurisdiction to correct an alleged erroneous survey of a patented placer claim, while the patent is outstanding, so as to include land not applied for or surveyed.

IN case of an attack on a mineral location of land that has once been adjudged mineral in character, the abandonment or forfeiture of the claim must be shown by clear and unmistakable evidence.

IF the matter in the earth's crust be represented by 1000, oxygen would equal 480 parts thereof, silicon 290, aluminum 80, iron 60, calcium 30, magnesium 20, sodium 20, potassium 15, hydrogen 2, other elements 3.

NO ONE was ever saved by faith in the mining stock market, whatever effect it may have had regarding salvation. In the stock market, however, many a one has been saved by want of faith. The conditions are different.

MILLSITES are not mineral entries. On the contrary, the land entered must be shown to be non-mineral. They are merely auxiliary to the working of mining claims. The owner of a patented lode may by an independent application secure a millsite.

TO FIND the pressure in pounds per square inch of a column of water, multiply the height of the column in feet by .434. Approximately, every foot elevation is equal to one-half pound pressure per square inch. This allows for ordinary friction.

IN the chlorination process the more copper in the ore the greater the consumption of chemicals. Where pyrites are copper-bearing forty to fifty pounds bleach and that equivalent amount of sulphuric acid may be required, while where clean iron pyrites are treated only ten or fifteen pounds are necessary.

THE mean pressure of the atmosphere at tide level is usually estimated at 14.7 lbs. per square inch, so that with a perfect vacuum it will sustain a column of mercury 29.9 inches, or a column of water 33.9 feet high. In ordinary practice pumps should be placed not over 20 feet above water supply, nearer where possible.

CRYSTALS form in cold weather in an indicator bottle in a chlorination plant in which chlorine is generated by sulphuric acid and chloride of lime in vats apart from those used for solution. An increased temperature causes them to liquefy, volatilize, give off chlorine and leave no residue. These crystals may be presumably regarded as chlorine hydrate.

AS TO economy of fuel, the horizontal tubular boiler is subject to the same rule as other boilers. Maximum economy may be obtained from it if the furnace be of a kind which will burn the coal thoroughly, if the extent of heating surface be sufficient for the amount of coal burned, and if the passages through the flues are so restricted in area that the gases traverse the upper and lower rows with approximately the same velocity. Its chief merit is its low first cost.

TO FIND the horse power necessary to elevate water to a given height, multiply the number of gallons per minute by 8.35, weight of one gallon, and this result by total number of feet the water is to be raised (that is, from surface of the water to the highest point to which the water is raised), and you have the power in foot pounds. Divide by 33,000 and you have the horse power. One horse power is equal to about five men. To the theoretical power a liberal allowance for friction, etc., should always be added.

IF the barometer stands 30 inches at the mouth of an 1800-foot shaft it will be 32.14 inches at the bottom. If its reading be 30 inches at sea level, it will be 17.2346 inches at a height of 20,000 feet. Were it possible to have a shaft 20,000 feet deep the barometer at the bottom would read 115.71 inches, or about 8 atmospheres. By following this out one could tell by an accurate barometer in a mountainous region how far above or below the level of the sea the top or bottom of a shaft was, provided the depth of the shaft were known.

THE undercurrent is a large, shallow kind of sluice, from 20 to 50 feet wide and 40 to 50 feet long, with sides 16 inches high, set on a heavy grade at the side of and a little below the main sluice, the design of it being to relieve the latter of the finer material and permit of its handling the remainder more effectually. This structure is located at a point where the grade is too spare for a drop in the main sluice, across which there is here set an iron grating. Through this grating the finer material drops into a box paved with blocks and set at right angles to the main line of sluice; the coarser stuff which passes over the grating being picked up by the sluices set on a lower level, the box meantime discharging its contents through a chute into the undercurrent. This chute, which is paved with cobbles and set with dividers of wood whereby the flow is distributed evenly over the undercurrent, has a 2% to 3% grade and narrows toward its lower end. The undercurrent, the bottom of which is made of 1½-inch plank, tongued and grooved, is set on an 8% to 10% grade. It is paved with cobbles or small blocks. The gravel escaping from the undercurrent is caught in a side sluice and returned to the main line. Formerly a sort of subsidiary undercurrent, set beside and below the principal structure, was in use, but they have been discarded in recent practice. A sluice head of water is a constant flow of one cubic foot per second, equal to 40 miner's inches. One sluice head of water falling 8.8 feet is equal to one theoretical H. P.

TO FIND the capacity of any single-acting cylinder, square the diameter (in inches) by the cylinder, multiply this by .7854, and the result (which is the area of the circle of cylinder) by the length of stroke in inches. This gives the capacity of cubic inches per stroke. Multiply this by the number of strokes per minute, and divide the product by 231 (the number of cubic inches in a gallon of water). The result will be the capacity, or gallons of water, the cylinder will discharge per minute. A two-cylinder or double-acting cylinder has double the capacity of a single-acting cylinder.

SULPHIDE ORES carrying 2% to 10% of pyrites which would not give more than 20% extraction of the gold in the raw state will often give 85% to 95% after a dead roast and treatment with cyanide. In mines where the oxidized and sulphide ores are mixed, especially from the surface workings, it is often the case that these ores are acid, and it is economy to roast the mixed ores, thereby putting the gold in the sulphide ores in condition to be easily extracted and often saving a higher percentage of gold from the part that was originally oxidized, besides destroying the acid quality the ores originally had before roasting.

IN hydraulic mining the cubic yard is generally taken as the unit of measurement for work, and when applied to the valuation of a claim is considered to refer to the total contents of the volume of material between the rim rock from the surface to bedrock on the line of deposit. When the statement is made that a hydraulic mine will yield so much or so little gold per cubic yard, hydraulic miners do not understand that as asserting that in the gold gravel designated there is the stated quantity of gold in each and every cubic yard, but that that is the estimated or stated amount to the cubic yard as a general average of the entire contents of the ground in question.

A ZINC–LEAD ORE containing copper should find no difficulty in securing smelter treatment in Colorado, Utah or California. In the former State it may be successfully treated at Canyon City or Leadville; in Utah, the Hanauer smelter at Salt Lake; in California, the Selby Smelting & Lead Co., Vallejo. The treatment charge would necessarily depend on the character of the ore. That and freight charges would determine the profit or loss of shipment. Were there iron and lime in the ore a smelter could do better than if it were siliceous. So many factors enter into the problem that it is difficult to more than generalize. Better address your nearest smelter, sending fair sample of the ore.

THE water level in a boiler may be judged from the mean of the water surge in the water gauge. If gauge cocks only are used, the approximate water level may be judged from the manner of opening the gauge cocks. By slightly opening the gauge cocks one after the other, one may obtain clear steam from the upper gauge, a drizzle of water and steam from the middle gage and more solid water from the lower gauge, when the mean height is between the middle and lower gauge, with variations suitable to high or low water. A boiler may foam from excessive use of steam or from foul water, or want of cleaning. An engineer should always be able to judge whether the boiler is too small for its work or whether dirty water and want of cleaning is the cause of foaming.

THERE is no such thing as a perfect solid. Certain conditions of pressure will cause any rock to flow, and, when strained beyond a certain point, they become deformed first, while a continuation of the strain causes rupture. Shearing is the motion of a rock along lines of maximum longitudinal strain. The same force may have different effects upon a rock, depending on the degree with which it is applied and the toughness of the rock. When there is but little difference between the limits of solidity and the ultimate strength of a substance, it is said to be brittle. A strain which, when exerted on a brittle rock, shatters it, will, when applied to a tough rock, cause a clean cut. The more rigid rocks transmit any compressing strain better than those that yield readily. A tangential thrust on stratified rocks is transmitted in the direction of the strata in different degrees, according to the inflexibility of each stratum. As soon as a bend takes place the force is split up into one tangential and the other radial. The radial component tends to raise or depress the stratum according as it is directed upward or downward. A lateral thrust on a rigid body tends to form a series of overlap faults, and if the face be continued the faults show a tendency to ride forward en masse over the less disturbed beds.

TO FIND if a certain low-grade gold or silver ore is susceptible of profitable concentration, take a weighed quantity of the dry pulverized ore passed through a 40-mesh screen, such as would be a fair average sample of the bulk of ore treated, say, one pound, after having previously assayed the sample. Pan this quantity carefully into a second pan, and repan until all the sulphurets are separated from the gangue, then dry and weigh the sulphurets and assay them. The weight represents the percentage of sulphurets the ore contains. Following is also a practical formula for estimating the percentage of sulphurets in quartz: Take 10,000 grains or 20.8 ounces of crushed ore, which will pass through a 40-mesh wire screen. Wash the ore very carefully in batea or pan and rewash as long as sulphurets appear. Dry and weigh. Each grain of sulphurets will equal $\frac{1}{100}$ of 1%. If the sulphurets weigh 175 grains, the quartz contains 1¾% of sulphurets; or, if twenty grains, ⅛ of 1%. If the sulphurets are worth $100 per ton, the value of sulphurets in each ton of ore is $1.75, if ⅛ of 1%—20 cents per ton. To test tailings, dry and weigh 10,000 grains; wash as above; dry and weigh the sulphurets; each grain will represent $\frac{1}{100}$ of 1% and a loss of 1% per ton if the sulphurets are worth $100 per ton. Thus, if the 10,000 grains of tailings yield 3½ grains of sulphurets, the loss is 3½ cents per ton in sulphurets. If the sulphurets are worth $60 per ton, multiply 60 by 3½, and 2.1 cents is the value of the sulphurets in one ton of tailings; if they are worth $375 per ton, multiply as above, and the value in each ton of tailings is 13.12 cents per ton in sulphurets.

WHEN a shaft has become too deep for a windlass a horse whim may be substituted. It is light, inexpensive, and easily and quickly erected. The work done by an average horse, per minute, is taken as 19,800 foot-pounds; speed of travel while hoisting, 3½ to 4 miles per hour, and the average tractive force about fifty-five pounds. The power developed and the hoisting speed will depend upon the relative diameters of drum and the circular path traversed by the horse. With a well-constructed whim the duty of a single horse may be taken as a gross load of 600 pounds, raised at a speed of 35 feet per minute. This includes the weight of bucket and rope. With an unbalanced bucket the useful work of a horse is reduced from 19,600 to say 14,000 foot-pounds per minute. Under these circumstances, at a depth of 250 feet, a maximum of 15 tons can be hoisted by one horse in ten hours. Light steel buckets for whim work weigh 200 to 300 pounds, and the rope would generally be of steel, ½ or ⅝ diameter, weighing, respectively, 0.35 and 0.60 pound per foot. One-horse whims have been used to as great a depth as 450 feet, but such practice is very unusual, because the speed must be slow and the net load reduced on account of the weight of the rope. With two horses a gross load of 800 pounds can be raised 50 feet per minute in regular work. It is generally better to increase the speed than the load, by using a larger drum, because small buckets can be more conveniently handled at the surface. With gearing the angular velocity of the drum is about one-third that of the sweep; that is, if the beveled pinion on the vertical shaft have twenty teeth, the spur wheel on the drum shaft would have sixty teeth. For one and two horse whims only one man is actually required at the surface; for larger machines two men are employed, one as driver, the other to handle the bucket and brake. Whim horses may be controlled by the voice, being taught to start and stop without a driver. Whims are commonly provided with stop-brakes, so that the empty bucket may be lowered while the horse is standing at rest. They are made generally for a single bucket, as a pair of buckets are liable to strike each other in passing in the shaft, but, of course, there are the same advantages in using balanced buckets as obtain with the windlass.

MUCH has lately been said about ore stealing in Colorado mines, and instances given of the discharge of an entire shift for wholesale theft. Probably in no place in the world is ore stealing so prevalent and universal a practice as in Bolivia, where has been developed an aptitude for making way with rich mineral remarkable for its varied ingenuity. Apparently, no amount of surveillance can prevent it. At these mines numerous watchmen and other employes are maintained with but dubious results. With the idea of reducing stealing to a minimum, the laborers in some of the mines at Colquechaca are kept underground and nominally at work for twenty-four hours each alternate day. For this they receive two days' wages, though the actual working time is considerably less, for no man can work effectively for so many consecutive hours, especially at the great altitude of Colquechaca. The theory is that every time a laborer comes out of the mine he carries with him some portion of stolen ore, and therefore the fewer times he has occasion to go to the surface the less he is able to steal. This seems sound, but the mining companies undoubtedly lose more in paying for work that is not done than is gained by the adoption of this method for preventing theft. The laborers seem destitute of moral sense and are marvelously adept in the art of stealing. Their fertility in the devising of new methods for carrying off rich pieces of ore, in spite of careful watching and systematic searching, is shown in numerous ways, some of which are indescribable. Pure ruby silver is ground to powder, sewn up in tiny muslin bags or pads, and concealed in the lining of clothing; powdered ruby is rubbed in the hair—of which the Bolivian has a very heavy growth—the hair and scalp being generously anointed with lamp oil or candle grease; the whole body is sometimes covered with oil or grease and the precious ruby rubbed in, to be removed afterward by a hot bath; small masses or crystals of ruby silver are concealed under the tongue, in cavities of the teeth, in the cheeks, ears, nose or other parts of the body. A bit of mine timber, or the broken handle of a pick or hammer, is sometimes hollowed out and pieces of stolen mineral put in, the opening being carefully concealed by a well-fitting wooden plug. These pieces of wood are then thrown into a car of waste; a confederate, at a distance outside, notes where the stick lodges as it goes over the dump and watches his chance to recover it. This method is possible on account of the very small amount of timber used in these mines, so that a bit thrown on the waste dump is a conspicuous object.

The Joplin Zinc District of South-West Missouri.*

Written for the MINING AND SCIENTIFIC PRESS by JAMES H. STEELE.

The western mining world is only just beginning to hear of this district. It seems strange that this community should have reached its present importance as a mining center in such a quiet manner. The daily press, while usually so anxious to herald to the world anything out of the ordinary, has in its haste entirely overlooked this great camp.

That it is great, no one conversant with its present condition will deny. That it is destined to become greater than the greatest of base metal producers, is also plainly evident to the discerning eye. Not alone are the deposits of almost limitless extent, but the unrivaled purity of the metals produced from these ores assures the miner of top prices in any market. A few years ago the region was barely noted in the books as zinc producing, while to-day it produces over one-third the world's supply.

Our lead is as pure, if not so abundant as our zinc, and is a potent factor in ranking Missouri as one of the great mining States of the Union.

Lead has been mined here for a century and a quarter; zinc, however, has reached its importance only in the last decade. Just as many western silver camps have changed since 1873 to gold producers, so has Joplin changed from a lead camp, where zinc was thrown on the dump, to the greatest zinc producing district in the world.

The following table gives the value of the combined lead and zinc output for the past five years. The magnitude of last year's production, as well as the increase over previous years, will be noted:

Zinc and lead sales in 1895	$3,771,979
1896	3,867,595
1897	4,805,637
1898	7,171,814
1899	10,864,476

In the face of such figures, it is not to be wondered at that farmers in all directions from the mining centers are delving beneath their fields and orchards in search of the zinc and lead that has enriched so many of their neighbors.

The Joplin district is in the southwestern corner of Missouri, about 165 miles directly south of Kansas City.

The city of Joplin is the commercial center of the district. Within a radius of 15 miles are located the lesser camps of Carterville, Webb City and Carthage, in Missouri, and Galena, just across the line in Kansas.

Although Joplin depends entirely on the mining industry, it is remarkably free from the features that usually characterize a mining town in a state of boom. It is a well organized, strictly modern city, claiming to-day a population of 40,000, being an increase of just 100% for the year 1899. This increase is due to the great advance in prices paid by the zinc smelters for the raw ore.

Fine buildings and imposing business blocks present a curious contrast to the ramshackle mine buildings and unsightly dump piles that surround the city on all sides. Just such a combination of a modern city and a mining camp of tents and bunk houses merging into and becoming parts of each other is not to be seen elsewhere in the United States, or in the world. A ten-minute walk in any direction brings one into the heart of the mining district. Nor is it all necessary to walk. A rapid-transit electric system, over 35 miles in length, furnishes a means of easy access to all the important parts of the entire region, from Galena, Kan., on the south, through Joplin to the beautiful residence city of Carthage on the north. This is supplemented by local trains on one of the steam lines. The benefits of a city equipped with a paid fire department, gas and electric lighting, sewers and macadamized streets are enjoyed by Joplinites.

The Joplin district proper is an area of about 200 square miles around Joplin as a center. It is a flat, gently-rolling prairie country; the district is connected by a system of macadamized roads, well kept, rendering wagon haulage cheap and comfortable. The surfacing material used on these roads is crushed flint—tailings from the mills. These tailings are also used by the railroads for ballast and are spread hundreds of miles over southern Missouri in this manner.

Joplin is a "poor man's camp." A man with a few hundred dollars has an opportunity to better himself. In all digging, labor is the chief expense. Ore can be taken out with an equipment that is surprisingly cheap and simple. The royalty, or leasing, system prevails here, and it, together with the methods of marketing the ore and the mode of settlement, are unique and worthy of note.

As all the land was taken up as homesteads before mineral was discovered, it is found that the present owners are nearly all farmers, except where the land has changed hands within the last few years. The original owners seldom do any mining themselves, but prefer to lease their land in parcels of from ten to forty acres, as so-called "first leases." These tracts are now divided up into mining lots 200 feet square, which are subleased to the mining operators or second leasors. Royalties are paid on gross sales of ore. The almost universal rates are 10% for first leases and 20% for second leases. The miner prospects his land, develops it and produces the ore at his own expense. Prospecting is done by means of the churn drills, putting in 5-inch or 6-inch holes 150 or 200 feet. Diamond drills can not be used, on account of the open nature of the formation.

Before becoming salable the ore must be washed, which is done in hand or steam jigs, according to the financial condition of the operator.

In the matter of selling the ore the practice here differs materially from that of most other localities.

The concentrates are sold once a week at the mills. They are purchased by the smelters at Cherryvale and Iola, Kansas, the Empire Zinc Co. of Joplin and Mattheson & Heigler at La Salle, Ill., and some are shipped to Swansea, Wales, and to Belgium. The purchasing agents of the smelters are known as "jack buyers," jack being the exclusive local name for zinc ore.

The output of the mines and mills is never contracted for in advance, but simply disposed of as produced.

The concentrates are not sold by assay, but by inspection. The jack buyer visits each mine once a week. He goes to the bin, takes up a handful of concentrates, and, letting them slip through his fingers, mentally notes the presence or absence of gangue material, and names a price of so many dollars per ton for the lot, without any further knowledge of its value than its hasty inspection tells him. This has been the method of sale ever since the first discoveries of zinc and lead. The more experienced buyers claim to be able to judge the value of concentrates to within 1%, and, as most mill men or ore men become equally clever, this arrangement has always been satisfactory. Lately, however, the Mine Owners' Association has been making great efforts to change the system and have all sales made according to assay. Is has been in a measure successful. Another thing they have been trying to regulate is the price of jack, or, at least, they insist that it should be regulated by the price of spelter in St. Louis. Heretofore the price of raw ore has borne no relation to the price of zinc, prices of each fluctuating entirely independent of the other up to five years ago; $23 per 2000 pounds for 66% ore was considered top price, while one month last year as much as $55 per ton was paid. During January, 1900, $35 was the average price; $30 is considered the normal figure to be looked for in the future. The great advance over previous years was due to the increased consumption in the manufacture of brass, galvanizing iron for electrical purposes and in cyaniding gold ores.

Corresponding to the weekly sales of ores, all mining business is settled up every Saturday night and in a most novel manner. All parties concerned meet at some down-town resort, such as hotel lobbies, saloons, stores, or any convenient place. In the usual case, where there are two leases, four distinct operations take place in the course of the settlement. Although the jack buyer buys the ore from the miner, he makes out his check and hands it to the land owner or his agent. This person deducts 10% for royalty and gives the first leasor a check for the remainder. The man who sold the ore now receives a check equal to 80% of the gross sale price, and, lastly, the men are paid off usually with checks, also. All the banks of Joplin are open two or three hours on Saturday night to accommodate the mining men.

There are estimated to be 400 concentrating mills in the district, 150 of which were put up during 1899. From the top of an old dump near Carterville the writer counted forty-eight mills in operation.

Ore dressing in this district is only just beginning to emerge from the primitive conditions that have so long characterized it.

For many years it was the practice to dump the ore over a grizzly, to separate the ore from the larger pieces of rock and boulders of flint. What passed through was washed in sluice boxes. This was very wasteful and slow, and later was supplemented by hand jigs, which have continued in use up to the present time.

The jigs are the ordinary hand jigs, consisting of a shallow box having a screen or grate bars for a bottom, suspended in a tank of water. The ore is placed in this box, which is then given a springing motion by means of a long pole, to which it is attached. The ore, being heavier than the gangue, settles faster and falls to the bottom of the tank, where it is saved.

Although many large mines still handle their output in this manner, the great majority are equipped with the standard 100-ton mill. The concentration is effected entirely in Hartz jigs. The ore is crushed to about ½-inch or less and sent over the jigs, big and little together. No attempt is made at sizing. It is an easy separation, owing to the great difference in specific gravity between the Pb and Zn sulphides and the lime and flint gangue.

The losses in the tailings are from 1% to 3% Zn and very little Pb. Nearly all of this could be saved on any of the shaking tables, few of which are in use here. A "sludge" or slime mill has been in operation for many years at Galena, Kan., treating the tails from the neighboring mills. They crush fine and run the pulp through sluices, where the surface of the water is continuously slapped by strips of canvas on the end of sticks wielded by boys, thus causing the slimes to settle to the bottom.

The earlier diggings were for lead and were undertaken without capital, and therefore with little or no machinery. The deposits were found near the surface and were often worked by open cuts. When shafts were sunk they were small affairs, just large enough to get a "tub" through. As soon as ore was struck the miner would gouge around and take out what he could above water level. In this manner a number of shafts would be put down on one lot. The large rooms from which the ore was taken were left without support of any kind, and as a result the older tracts around Webb City and Carterville are marked by great yawning pits, showing where the ground has caved in on the long-abandoned workings. It is said that in the old Victor tract five acres are undermined in this manner. The Four Aces mill was moved three times on account of the ground caving under it. The mining done to-day is but little in advance of these practices.

The shafts sunk are usually 5 feet square. They are cribbed 20 or 30 feet from the surface when they pass through loose ground. Below that they are rarely timbered, being in hard rock. Most miners begin to gouge out the minute they cut it, without regard to their present safety or future extraction of ore. Sometimes the ore immediately around the shaft is entirely removed, so that the shaft opens into a room like the bunghole in a barrel.

Where a definite plan of mining is followed the system of pillars and rooms similar to that used in coal mining is the one adopted. The ore bodies are continuons through bodies of ground 20 to 40 feet high and of indefinite lateral extent, so this is the only method adaptable to the ore extraction.

The ore is broken down by a system of underhand stoping. In the wall or face of ore to be attacked a heading is driven next the roof just high enough for men to work in, and to any desired depth. This leaves a sort of shelf, which is shot down and the heading again driven forward. Except in driving the heading the shots are always put in the floor. This results in a series of rough steps or benches 10 feet in height and sloping to the roof. The rock as it is broken out rolls down this incline to the bottom of the level, from where it is trammed to the shaft.

In the ordinary hoisting plant the engine is placed in a little house set up 20 or 30 feet above the collar of the shaft, and above the charging floor of the mill. The tubs are pulled up through the floor of the engine house and dumped on the platform of the mill by the hoister man. One mill often handles the output of two or three shafts, in which case the tubs are trammed across the intervening spaces on trestles 20 or 30 feet above the ground. There will often be a half dozen shafts in a group within 100 feet of each other.

It is generally an easy matter to have good air in the mines without the use of artificial ventilation. In all the largely worked parts the drifts and stopes of neighboring properties all open into each other, affording a good natural draft. In the more isolated tracts, where only one shaft is down, small fan blowers are put in and the air conducted in the mine through canvas tubes.

GEOLOGY OF THE DISTRICT.—The country rock of the entire district is of sedimentary origin. It consists mainly of limestones, shales, sandstones, cherts or flint. These occupy a nearly horizontal position, having been only slightly disturbed since they were deposited on the bottom of the ancient seas. The general dip is toward the west, but so slight as to be hardly perceptible. The country is crossed by many vertical fault planes, but the movement has almost always been very slight, usually a few inches at most, so they produced no fissure of any consequence. They really amount to nothing more than the common joint cracks to be seen in any deposit of limestone. These rocks belong to the lower Carboniferous epoch. Occasional small pockets of coal are found in the shale. Almost all the mineral deposits occur in the limestone and in the chert.

The form of the ore bodies here can best be described by the word massive. They are immense deposits which, when mined out, leave chambers of enormous extent. The thickness is usually much less than the lateral dimensions. Twenty to 60 feet is a common thickness, while they are hundreds of feet in diameter. The exact shape of most deposits is not known, as they pass outside the boundaries of the land operated by any one company. There is also a great lack of maps of underground workings.

The upper and lower limits of the ore bodies are usually very clearly marked by a capping of barren lime or chert. In a horizontal direction the zinc and lead will thin out without any change in the gangue. Beyond the main body the gangue will not always be entirely barren, but small streamers of ore can be traced through it in all directions from a few inches to a knife blade in thickness. These are not at all certain to lead to another body, but they are about all the miner has to guide him in looking for new bodies.

In some cases pipes or chimneys occur, but these are considered simply as modifications of the general

*See illustrations on front page.

massive form. A somewhat common form is a series of rough sheets or layers of ore alternating with limestone or flint. Distinct fissure veins do not occur, the nearest approach to these being the horizontal sheets just mentioned. No matter what the relation of the gangue to ore in the ore bodies, the latter are invariably of the massive or cavernous order. This is sometimes called a blanket formation, but that name can be rightly applied only to the country rock, and not to the ore formation.

In only a few places does the mineral outcrop at the surface, but it is regularly found up to within 10 feet.

The deepest shafts in the district are about 200 feet, while fully 50% are less than 150 feet. The ore bodies cut by these at the various depths all have the same general form and characteristics. Although the ground has been opened only to such slight depth, yet it is known that the ore bodies continue to much greater depth, even up to 1000 feet. Boreholes have been put down in all parts of the region to great depths. Holes made by different operators and in widely separated places agree as to the existence of far richer and larger deposits at 500 feet than those now known above 200 feet.

The lead and zinc occur as sulphides mainly. Blende or jack furnishes almost all of the zinc. Jack is found both massive and in a disseminated condition, and in crystals. As the latter it is found lining the cavities in the limestone which are so common. The sulphide—galena—furnishes all of the lead. The carbonate—cerussite—is found in small amounts near the surface. Pyrite—locally "mundic"—occurs in some places with the lead, but is a detriment to the ore, as it can not be separated from the lead by the jigs, and $1 for each per cent is deducted from the price of ores. The galena and blende from here are extremely pure and command a high price accordingly. Not a trace of gold and only a trace of silver is ever found in these ores, which is in itself a peculiar fact.

Mixtures of gangue or vein stuffs and minerals—metalliferous and others—compose the ore deposits. Although some shales and sandstones occur, together with dolomite, heavy spar and clays, by far the most common gangue materials are flint and limestone, and of these two flint is in the greatest abundance.

The ore bodies are enormous masses of breccia. The fragments are mainly flint derived from the country rock. Limestone is also often found. The fragments are always angular and never water worn. The interstices are filled with jack or galena, or both, deposited from solutions. The flints vary in size from that of a pea to several feet or more in diameter. The flint is always barren. The sulphides are more disseminated through it, as they are through the limestone. Zinc and lead will often be found separated from each other in the same brecciated mass.

In the Big Four mine at Galena, Kansas, in an ore body 40 feet thick, jack is found in the first 10 feet. Below that lead is found, without a trace of zinc. Zinc and lead both occur in irregular sheets or veins, sometimes forming the cementing material of the breccia.

In places where the lime is not badly broken up ore is found in seams and pockets along the bedding planes. When these widen out into large chambers flint fragments begin to come in. Calcite, borite, dolomite, bitumen and quartz are also found as accessory minerals.

Following are the Missouri–Kansas district sales of zinc and lead ore for the week ending May 12th and the total sales since January 1, 1900:

Camps.	Zinc, lbs.	Lead, lbs.	Value.
Galena and Empire, Kan..	2,098,230	230,640	$ 34,860
Joplin, Mo	2,879,670	539,670	56,504
Carterville	2,304,290	365,340	40,720
Aurora	1,280,000	34,000	13,243
Webb City	529,980	51,180	8,632
Oronogo	520,700	2,830	7,681
Granby	383,000	18,200	4,810
Zincite	365,390	8,950	4,780

Carthage	264,660	....	4,499
Central City	196,600	....	1,845
Cave Springs	94,530	....	1,275
Everton	59,100	....	443
Dist. total for last week..	12,062,130	1,327,870	$197,171
District total since Jan. 1, 1900	194,843,850	21,782,490	3,377,308

Joplin, Mo., May 15.

THE Virginia, Nevada, Chronicle says: A combination compound of carbon dioxide and nitrogen, prepared by F. E. Fielding, assayer at the Con. Cal. & Va. office, to absorb the gas generated by blasting with giant powder, is a success. The compound was placed in a rectangular box 3 feet long, 28 inches wide, 10 inches deep, run on a truck into within 30 feet of the face of a drift where a round of holes had been fired and absorbed the nitrous oxide gas, produced by blasting with giant in twenty minutes, using twelve sticks of powder. After the compound had been absorbed the powder gas is dissipated in a short time after coming in contact with pure air and the compound can be used over and over again.

Treatment of Copper Mattes in the Bessemer Converter.*

NUMBER V.—CONCLUDED.

Instead of cooling the copper in moulds it may be poured into a refining furnace as we have said is done at Anaconda, and at once brought up to any desired pitch. When this is done, if the matte be poured direct from the furnace in which it is made to the converter and then to the refinery, the processes of matting, concentrating, and refining are unbroken and continuous, and can be probably more economically conducted in the three vessels than will ever be done in one.

The lining when it has become dangerously thin is everywhere rough and rugged. The lining of the body of the converter is much more corroded than that of the cover which, though it has to be removed after each charge, does not require to be as often replaced. As, moreover, the boiling charge never actually reaches the cover nor attacks it, it can be lined with a more tenacious and less siliceous mixture than the body of the converter. The almost universal custom is to cool the exhausted converter by the injection of water, then to reline to the full thickness of, say, 18 inches, dry, and heat with coke into which a low blast is injected through the tuyeres to facilitate the drying. To prevent the loosening of the lining from the shell the upper part of the body and the cover are by some manufacturers perforated with holes. The methods of inserting the lining have already been explained.

There is a good deal of discrepancy in statements as to the value of the slag. Slag unmixed with matte from the first blow undoubtedly often runs under 1% of copper; but it requires very careful pouring and sorting to secure such a result, while the 5% copper contents given by Hixon as being in the slag at Anaconda and Aguas Calientes is high. An average of 2½% is probably not far from the mark, though a much cleaner slag can be selected. The cost of doing so and the uncertainty of the result has induced the works almost without exception to rehandle the total bulk of the converter slag. If reverberatory smelters are used and they are near the converter the liquid slags are settled in them. At the Clifton works, the slags being slightly basic and the ore charge acid, they are advantageously added to the ore in the cupolas. The quantity of slag depends on the grade of the matte treated.

COST OF CONVERTING.

The cost of the pneumatic concentration of matte to copper of course varies widely; no estimates which would hold good in any two works can be made. If remelting of the matte must be resorted to it alone will increase the cost by ½ to ¼ cent per pound of copper. Where water power is available the chief item of expense—the cost of blast—is largely eliminated, and where the plant is conveniently arranged the handling of the fresh and exhausted converters, the lining, and the disposal of the slags cost less than in ill-designed establishments.

Mr. Burthe, in his description of the David selecteur, gives what he claims are actual figures of the cost of converting into copper a 35% matte at Aiguilles. They are as follows:

With the high cost of labor, even in the cheapest American labor market, this low figure of 0.36 cent per pound has probably never been reached. The figure at which the operation can be conducted under favorable conditions in this country lies between the Anaconda prices (viz: 0.607 cent) as given by Hixon, and French prices.

Hixon gives the following estimate as that of the average cost of converting 55% matte:

Remelting matte	0.2
Labor and lining for converters	0.25
Labor on converters	0.1
Resmelting converter slag	0.05
Supplies	0.05
Total	0.65
For a plant without remelting	0.45

Assuming that the power consumed to make 1,000,000 pounds of copper per month in one converter is 110 H. P. (NOTE.—In steel making, 200 pounds of coal per ton of steel made are generally calculated as consumed in running the blowing engine): that in creating 110 H. P. with the ordinary blowing engine five tons of coal are consumed per day, which represents about twice the quantity of coal per ton of matte as per ton of steel: that about 250 tons of clay and quartz are consumed, and at the outside 1000 days' labor, including superintendence, are expended on the making of the 1,000,000 pounds of copper, any one can calculate for himself what the cost will be in any given locality where the cost of fuel, lining material, and labor is known. It must be remembered that the work is attended with some little risk, and requires more than average intelligence and special skill on the part of the workman, and that, therefore, high wages should be allowed.

The actual losses are more difficult to arrive at than the cost of operation. At the works I am connected with the converter dust and fumes enter the system of furnace flues and dust chamber, and therefore their quantity and contents cannot be ascertained.

Hixon says with regard to losses at Anaconda: "The losses in converting as shown at Anaconda were about 3% of the copper contents, but there was a wide difference between assays of samples of matte taken at the converter plant and at the smelter. This difference amounted to 0.5% on all the matte received, and represented about 1% of the loss, so the real loss was probably only 2% of the copper. The silver loss was apparently high according to assays of the converter copper, but the casting showed a corresponding gain, and after making allowance for this, the loss of silver in converting was reckoned at less than 1%."

Reverting to the table and series of analyses given above, the loss of silver in excess of copper would seem to be but 4%, but the data are admittedly unreliable. The copper, silver, and gold in the crust of the hood are almost exactly the same as in the white metal. The evidence, however, suffices to show that the loss is not great, and that therefore that method of converting and casting the fused converter copper into anodes, taken in connection with electrolytic separation, is less wasteful than any of the old processes. I do not refer to the direct method of James & Nicholls, which is probably to be preferred if white metal and not low grade matte is the material to be operated on. There is no reason to think that copper is volatilized to any extent; the flame from the converter mouth does not denote it.

The loss of silver is admittedly large where zinc and lead in any notable quantity are present. At the Aguas Calientes works in Mexico, where copper is used as the absorbent of gold and silver, and dry silver and gold ores are smelted with copper ore and matte into matte to be subsequently converted, no ore with an excess of 5% of lead and zinc is admitted to the copper furnaces.

Experience at these works where the contents of purchased ore has to be accounted for in the finished product, has fixed these percentages of the two dangerous associates as the maximum that can be safely allowed. If the slags are remelted, the loss in them is not in excess of the copper in the furnace slags, which in matte smelting in Arizona is about half of 1%. In the run tabulated above there were made sixty-two pots of slag of about 250 pounds each, 15,000 pounds, or approximately the same weight of slag as copper produced, assuming the weight of the slag to be that of the copper produced, and therefore one-half of the charge of 50% matte, and that the slags run 2½% in copper, they carry over for subsequent treatment over 2½% of the copper in the charge.

The importance of more exact investigation than has yet been given to the thermochemistry of copper converting can hardly be overestimated, even when measured by the low standard of the material interests involved and quantity of copper made annually by the pneumatic method. At present there are in the United States thirty-eight stands, about thirty of which are generally in blast, pouring out about 350,000,000 pounds of copper annually and about 9,000,000 ounces of silver and about 30,000 ounces of gold.

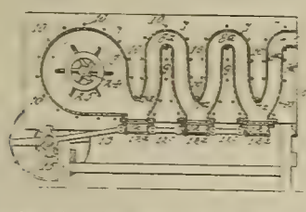
*Condensed from a paper read by JAMES DOUGLAS before the London Institution Mining and Metallurgy.

Mining and Metallurgical Patents.

Patents Issued May 29, 1900.

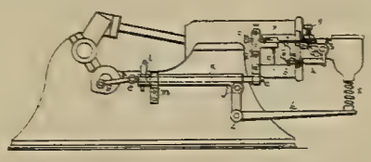
Specially Reported for the MINING AND SCIENTIFIC PRESS.

STEEL WATER GATE.—No. 650,502: J. Bouse. San Francisco. Cal.



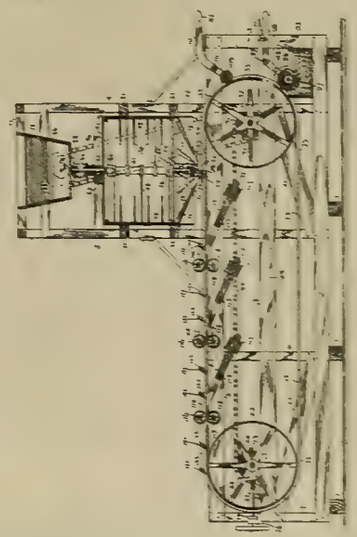
A water gate consisting of separable segmental sections formed of bent channel or angle iron frames with sheet metal side plates and rectangular angle iron frames surrounding their meeting edges adapted to be secured together, circular openings formed in opposite sides of lower part of case having annular interior screw-threaded rings fixed around openings, correspondingly screw-threaded tubes adapted to be removably screwed into rings, tubes having flanges surrounding their outer ends and forming connections with corresponding flanges of line of conducting pipe. An annular valve seat surrounding opening upon one side, valve adapted to close against seat or be withdraw into upper part of casing, screw shank extending through stuffing-box in casing having one end connected with valve, other end passing through turnable nut whereby screw is reciprocated to open or close valve, and yoke removably bolted to casing forming support for nut and guide for screw.

INDICATOR FOR SHAFTS.—No. 650,517: J. Place. Duluth, Minn.



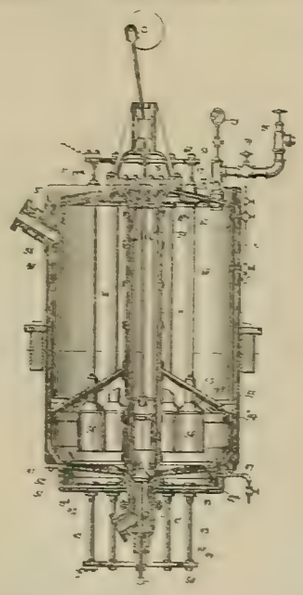
An indicator for shafts comprising lever, bracket for pivotally supporting lever extending at its upper end between legs of bracket, springs interposed between lever and each of legs of bracket for holding lever normally in an intermediate position, a divided collar adapted to be adjustably secured to periphery of shaft at suitable point to strike one end of lever as shaft revolves, cable secured to other end of lever connected with indicator shaft, construction being such that upon revolution of shaft indicator will be turned in one direction or other according to direction of revolution of shaft.

APPARATUS FOR SEPARATING METALS FROM THEIR ORES, ETC.—No. 650,800: F. H. Smith and L. V. Bond, Denver, Colo.



Combination of casing, comprising two vertical side walls, serpentine plate clamped between walls and forming drum compartment, several upright compartments communicating with drum compartment, double upright partition projecting into each upright compartment forming serpentine channel, fan located in drum compartment, reciprocating mineral box located below each depending bend of serpentine channel, links connecting mineral boxes, shaft, pitman connected with shaft at one extremity and with one of end mineral boxes at other extremity for imparting reciprocating movement to series of mineral boxes, means for feeding material to be treated to drum, and means for operating fan to induce an air current in direction to draw material into drum and carry it through serpentine channel.

GAS OR OIL ENGINE.—No. 650,571: H. Swain, San Francisco. Cal.

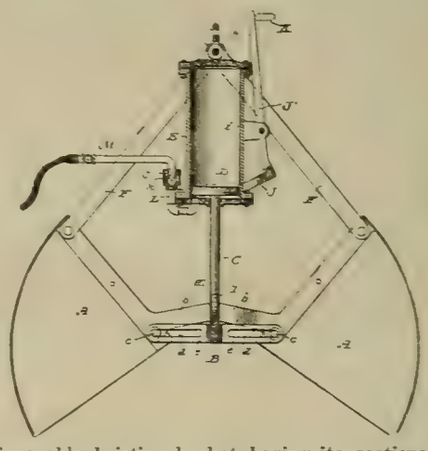


In a gas or oil engine connecting rod N operated by crank and sliding rod E operating sparking hammer P having an incline V in combination with latch B operating sparking point R through rock shaft S' and S.

AMALGAMATOR.—No. 650,581: A. M. Ernsberger. New York, N. Y.

An amalgamating machine, framework supporting drums carrying an amalgamated belt, disintegrating cylinder supported by framework above belt and having shaft therein and means for driving from drum shaft, hopper above disintegrating cylinder, double inclines in hopper centrally inclined having central space between them, oppositely disposed slides under inclines to increase or decrease central space, shaft within hopper, right and left hand screw blades thereon, spouts from hopper bottom at end of screws and leading into disintegrating cylinder, means to positively move shaft and screw blades, from drum shaft of machine.

APPARATUS FOR ELECTROLYTIC REDUCTION OF ORES.—No. 650,646: F. H. Long. Chicago. Ill.



An electrolytic apparatus, combination with closed reducer vessel having diaphragm near its bottom and cathode beneath same, of upright penstock communicating above and below with vessel, valved pump plunger reciprocating therein, and set of anodes arranged about penstock whereby charge is exposed to electrolytic action in flowing from vessel into penstock.

CABLE TRAMWAY GRIP.—No. 650,590: A. Rosenholz. San Francisco, Cal., assignor to the Trenton Iron Co., Trenton, N. J.

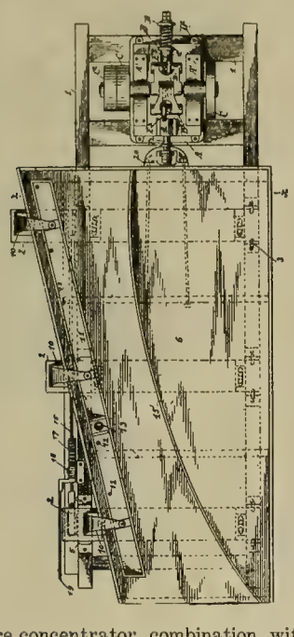
In a cable tramway conveyer, combination of conveyer frame and trolley frame movably carried thereon and adapted to travel upon track or cable, pair of jaws adapted to engage with moving cable, and rotatively mounted to automatically adjust themselves to line of cable, one jaw being movable with relation to the other, mechanism connecting trolley frame with movable jaw whereby latter is closed to grip cable between it and stationary jaw by suspended weight, a supplemental track disposed with relation to main track or cable, and pulley carried by conveyer frame adapted to ride upon track to support main frame so that gripping jaws are released from traveling cable.

HOISTING BUCKET.—No. 650,642; J. E. Henry, Sheboygan, Wis.

Separable hoisting bucket having its sections in pivotal union, crosshead with which bucket sections have slide connection, cylinder in link connection with bucket sections provided with inlet designed to have tight temporary connection with nozzle of conveyer for fluid under pressure, piston in cylinder opposed to inflow of fluid, rod connecting crosshead and piston, latches in connection with crosshead automatically engageable with cylinder, and latch retracting spanner in pivotal connection with cylinder.

ORE LIFTER FOR DIAMOND DRILLS.—No. 650,686: G. Leask. Nanaimo, B. C.

Cutter head provided with longitudinal ports and valve chambers, core barrel provided with diagonal



guide passages communicating with valve chambers, valve casing mounted in cutter head and formed with lateral ports and longitudinal ports, tubular spring-actuated valve and independent ball valve, spring-actuated valves mounted in valve chambers, and gripper pins having sliding engagement with core barrel.

SMELTER'S CRUCIBLE SHAKER.—No. 650,648; W. S. Mather, Newark, N. J.

A smelter's crucible shaker, combination of base plate providing seat for crucible, series of projections upon base plate surrounding crucible, lever removably fulcrumed at its lower end upon base plate and extending upward substantially parallel to length of crucible, and band of metal fastened to lever and lying in plane perpendicular thereto and being bent to grasp crucible.

ORE CONCENTRATOR.—No. 650,673; W. G. Dodd, San Francisco, Cal.

In an ore concentrator, combination with concentrating table having plane upper surface, of ore and water feed arranged thereabove, curved obstructing rib on face of table following generally inclined course from upper head portion to lower tail portion of table, of devices for regulating lateral inclination of table, curved obstructing rib 15′ on face of table arranged to generally follow line of travel of ore over working face of table, upper edge of rib gradually inclining from head end toward tail end of machine, mechanism by means of which variable reciprocating motion may be imparted to concentrating table.

METHOD OF OBTAINING ALUMINA FROM ITS ORES.—No. 650,763; E. Raynaud, Tessenderloo, Belgium.

Process for extracting alumina from aluminous ores which resist attack wholly or partially by sulphurous acid consisting in mixing with previously crushed ore quantity of sulphureted compounds of alkaline metals smaller than would be necessary for forming aluminates, heating mixture to dark-red heat in suitable furnace and submitting mass issuing from furnace to lixiviation and thereafter to action of current of sulphurous acid gas in combination with water, separating solutions holding alumina from residue containing impurities, heating thereafter these solutions and calcining precipitate obtained which yields alumina and sulphurous gas (SO_2)

METHOD OF LEACHING COPPER ORES.—No. 650,784; J. W. Neill, Salt Lake City, Utah.

Process of treating and extracting copper from sulphide of copper ores, tailings or material containing sulphide of copper, consisting in roasting ore in presence of air, thereby oxidizing and liberating sulphur therein combined, thus forming sulphurous acid gas, collecting product of combustion and oxidation in water, thus forming sulphurous acid, dissolving copper contained in burned ore by means of solution obtained from water and product of combustion and oxidation and precipitating copper from resultant solution by heating same.

Jeffrey Self-Propelling Gold Dredger.

The accompanying illustration shows the Jeffrey self-propelling gold dredger used on the Yukon river and elsewhere. The dredging is done by means of an adjustable elevator constructed of two chains and provided with buckets of suitable size and shape for digging. The elevator is pivoted at the delivery end so that it can be raised and lowered to suit the depth of the water. The material as it is discharged from the buckets falls onto a coarse screen or grizzly. The large stones and other worthless material pass over the grizzly and are discharged back into the water, the finer and gold-bearing material passes through the screen onto gold-saving tables or other appliances generally used for gold-saving purposes. The elevator is operated by means of an engine, either steam or gasoline. Suitable hoisting drums are also provided for raising and lowering the elevator, shifting the boat, etc. The boat is propelled by means of a stern wheel driven by sprocket wheels and chain from the engine, which also furnishes power for the balance of the machine. The engine and other parts of the equipment are built to suit the capacity and the depth of the water. The machinery for these boats, consisting of elevator, stern wheel drive, drums, engine, boiler, etc., is furnished by The Jeffrey Manufacturing Co., Columbus, Ohio, from whom prices and further particulars can be had upon application.

Self-Propelling Gold Dredger.

To Drive Gases from a Mine, Lay the Dust and Prevent Explosions.

In a conversation with Manager Hutchinson of the Trade Dollar Con. Co., recently, mention was made of the late Utah coal mine disaster and the more recent one in North Carolina, whereupon Mr. Hutchinson remarked that he could suggest an absolute preventive to the recurrence of such disasters. He said it was simply to run a steam pipe from the boilers to the farthest workings in the mines, and, as often as the conditions require, to blow a jet of steam into the mines and keep it up until the steam drove the gases and fire damp out at the shaft or openings. He says that a good many years ago he tried this method of clearing a metalliferous mine of poisonous gases in Colorado, and the effect was simply astonishing. He connected a half-inch pipe with a steam pump in the mine and led it to the most remote stope, turned on a full head of steam at 150 pounds pressure, and within five minutes such a stream of poisonous gas and steam was pouring out through the shaft that the man attending the hoist brake in the shaft-house was driven from his post. Within a few minutes the steam was shut off and soon that remaining in the mine condensed and fell, carrying with it every particle of dust in the mine. In a very short time the air in the mine was as clear as a bell. Before this was done the air was so vitiated with poison that miners refused to work in it. When the cloud of steam rolled out of the shaft it was a deep green from the poisons it carried with it.

Experience soon taught him that it was only necessary to repeat this operation, only a few minutes, about once a week to keep the air in this mine pure and wholesome. He says that shortly after this experiment had been made—he thinks it was in 1884—a terrible explosion in a coal mine, near Wilkesbarre, Pa., occurred, and Mr. Hutchinson wrote to the inspector of mines in that State telling him of his experiment in the use of steam, but nothing came of it; and since then an expensive system of laying the dust in mines by spraying them with water has been adopted in many localities. Mr. Hutchinson claims that his system of using steam not only to allay the dust, but to drive carbonic acid and other gases out of the mines, is much cheaper and far more effective than spraying, which merely settles the dust.—De Lamar, Idaho, Nugget.

The Process Should Suit the Ore.

The following question is illustrative of a class that is difficult to satisfactorily answer:

What reagent or strength of cyanide solution is best to use on an ore carrying fine sulphurets, without previous roasting, in a cyanide mill using zinc to precipitate the gold?

Granite, Or., May 28.

So much depends on circumstances. The process must suit the ore. Answer to the question hinges largely on what that particular ore is. It may be that cyanide would be just what is needed in the Oregon case cited; it may be that cyanide should not be thought of in connection with the ore.

The men who have charge of the business of furnishing cyanide plants understand this, and often try to keep a man from putting in a cyanide plant, where they think it would not result profitably. In this they show good business judgment. It would give their process "a black eye" to have sanguine men make failure in its use: failure chargeable to lack of knowledge of the ore rather than lack of merit in the cyanide process. The best thing for our Oregon enquirer to do is to have a thorough laboratory test made of his ore, have it clearly found whether his ore is or is not susceptible of successful cyanide treatment; then, if it is, start on a small scale after repeated experiments, and when he has found by such practical experimenting just what he needs to do in his especial case, he has the knowledge and experience that will suggest to him the business necessity of shutting down the whole thing or enlarging its capacity.

But no rule of thumb can be given. Nothing but intimate knowledge of all the facts could make any advice valuable, and such knowledge can only be secured in the way indicated. Illustrative of this fact may be stated that the amount of cyanide required ranges from one-fourth of one pound to three pounds of cyanide per ton of ore treated, according to the ore and attendant governing local circumstances. The cyanide process is not a universal solvent nor a panacea for all kinds of ore. In a great many cases it is the best, most economical process possible; in some cases it is of no practical use, and its value in any individual case can only be determined by intelligent and extended experiment.

Completing the Process.

TO THE EDITOR:—In your excellent article on "Parting Gold and Silver Bullion," in the issue of May 19th, you stop with the silver. What about the gold?

Butte, Montana, May 31.

In the description of the sulphuric acid process the gold was left as a sediment in the large iron dissolving kettle. A small quantity of fresh acid is added and the gold then removed to a smaller vessel by an iron ladle perforated with holes. It is transferred to another iron pot, in which it receives a number of repeated boilings with fresh strong acid. There are not less than five such boilings. The finishing acids are siphoned off and used upon fresh charges of bullion.

The gold is now transferred to a tub, in which it is washed first with cold water and then with hot. These washings find their way to the silver precipitating tanks. It is now transferred to a lead-lined vat mounted upon a truck. This vat has a perforated false bottom, which is carefully covered with cloth, the whole constituting a large movable filter. Water is now passed through the gold in this filter until it is entirely sweet. If the gold is in coarse particles it may be dried and melted without danger of its being mechanically carried off while placing it in the crucible, but if very fine it is compacted into cakes while wet by hydraulic pressure. The cakes are dried, as were those of silver, in a current of warm air, and melted in a graphite crucible. A trial sample is taken to see if the metal is tough. The presence of even small quantities of lead will render the gold brittle, in which case it is fluxed with niter through an "eye" in a cover of bone ash. When tough it is ladled into iron molds.

Mining on the California Gold Belt.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS, Assistant State Examiner of Mines.

Along the central gold belt of California there is an extensive development of amphibolite schists, resulting from the alteration of massive and fragmental greenstones. In some of these the alteration has proceeded to such an extent that the structure is slaty rather than schistose, and among this latter class are the black slates, altered from diabase tuffs, previously referred to. In many of the mines is found a gray schistose rock composed principally of scales of chlorite or talc with more or less calcite and silica, much of the latter evidently being the result of infiltration. In close proximity to the fissures and forming, in fact, a portion of the veins, these gray slates and schists are not infrequently impregnated with auriferous iron sulphide and gold and constitute a portion of the pay shoot, forming, together with the quartz veins, a mineral zone.

Massive rocks of many kinds become altered by pressure, the stress being relieved by the crushing and deformation of the individual mineral constituents and a readjustment of the fragments which arrange themselves along planes having a certain parallelism. This process is what is termed shearing. From this fragmentary material, by reason of an alteration of the original crystals composing the rock mass, many new minerals are formed and the rock becomes a schist or slate entirely unlike the normal rock in physical appearance, although possibly not differing materially in chemical composition. These schistose or slaty zones are of varying width and are of frequent recurrence within the same massive rock. The zones of schist are practically parallel, having a strike perpendicular to the stress which produced them. The gray slates and black slates derived from the altered greenstones are essentially the same, differing chiefly in their color. The black color is undoubtedly due to carbon though its source is as yet a matter of conjecture. The writer has been informed by a number of mine superintendents along the lode that they have learned, when assaying the black slaty ore, that no reducing agent (charcoal) was found necessary, the charge evidently containing sufficient carbon to reduce the litharge.

Too little attention has been given to the alteration of massive rocks, and a lack of knowledge concerning this important fact often leads to eroneous conclusions in mine development. The miner, searching for a certain contact, passes out of a massive rock into a slaty one, and concludes he has found the contact for which he had been searching, when perchance it is still some distance away. The crosscut is discontinued and it sometimes remains for another to continue it, possibly finding valuable ore deposits in so doing.

Not only do diabase and diorite become altered by the process of shearing, as previously explained, but other massive rocks undergo a somewhat similar alteration, and in some instances massive rocks pass over into other rocks without developing pronounced schistose structure. The large bodies of steatite found in Calaveras county are notable examples of this. Near San Andreas, in the vicinity of the Veritas and Ford mines; on the Sheep Ranch road, three miles from San Andreas; and on the road from Dogtown (near Angels) to Murphys, are occurrences of this character. In these instances a dark green, fine-grained, extremely hard and tough rock alters to a soft steatite (soapstone). The steatite is in part (locally) schistose (talc schist), but mostly massive. In each of the localities mentioned the dark green rock is found in what is probably not its normal condition, though probably near it, and from that every gradation may be observed through a partially altered to a completely altered rock, the extreme phase of which is, as above stated, talc schist or massive steatite. Series of rocks showing this alteration are on exhition at the museum of the State Mining Bureau of California in San Francisco, where may also be found other rock series showing alteration of other massive rocks to schistose and slaty condition.

An important characteristic of the central gold belt, although by no means a persistent one, is the occurrence of large dike-like masses of a highly crystalline rock which is essentially dolomite, consisting of the carbonates of lime and magnesia. These in some localities by the addition of iron carbonate become the mineral ankerite. This dolomitic material is usually accompanied by the beautiful green micaceous mineral mariposite. Occasionally the mariposite is absent. It has been stated that serpentine invariably accompanies the appearance of mariposite in this rock, but this appears to be not always the case. In the counties of Mariposa and Tuolumne, and extending for a distance of 2 miles into the southern portion of Calaveras county, at Carson Hill, the dolomitic vein has its greatest development, being not uncommonly from 100 to 300 feet in width and of remarkable persistence longitudinally. In some places it forms an unbroken outcrop for a distance of several miles, then disappearing, only to reappear farther on, being probably connected underneath the surface. Going northward from Carson Hill, the dolomite is not found until Smith's Flat, west of Angels, is reached, a distance of 5 miles, where it disappears, to reappear again near San Andreas, 13 miles distant from the last-mentioned occurrence. Near Jackson, in Amador county, the dolomitic vein has a width of more than 100 feet and continues in an unbroken outcrop for about 1 mile, when, disappearing as before, it is next again seen in the vicinity of Placerville, in El Dorado county. Wherever found this material presents the same characteristics, a rather coarse to fine, highly crystallized rock, resembling some marble. It is usually accompanied by veins of massive white quartz, which vary from a few inches to 60 feet or more in width. These are found distributed along or near its borders, and also, in some instances, through the middle portion. Occasionally it sends out offshoots or branches to east or west and has many of the structural features peculiar to large intrusive dikes. In addition to the large veins of quartz within the dolomitic mass there is often found a network of smaller quartz veins interlacing it in every direction. In some cases these quartz veins, and more rarely the dolomite itself, are gold-bearing. Throughout the entire length of the gold belt, wherever this dolomitic mineral occurs, it is not uncommon to find that it, like the greenstone, has been crushed, sheared and altered into a schistose, semi-slaty rock, passing, by transitions which may be easily followed, into talc schist. The processes which have resulted in this deformation of the dolomite are identical with those which have changed the massive greenstones to chloritic and talcose schists.

As has been previously stated, an impression has prevailed that the mines of the central gold belt, or mother lode, possessed such pronounced characteristics as to give them a certain similarity. Such, however, is not the case. It is quite true that in certain contiguous localities the mines do bear a certain resemblance to each other, but in the various counties they are as unlike as could be imagined. Some of those of Mariposa and Tuolumne bear a certain resemblance to each other, and these to some extent are not unlike those near Placerville, in El Dorado county. The mines of Amador, however, for the most part differ very materially from those above referred to, while most of the mines of Calaveras are unlike either. It would only be possible to get a definite idea of these mines and their changing characteristics by an intimate description of the mines themselves.

(TO BE CONTINUED.)

The Use of Aluminum Line Wire and Some Constants for Transmission Lines.*

By F. A. C. PERRINE and F. G. BAUM.

Until the present time, discussions of the use of aluminum wire in line construction have been devoted to a consideration of the relative prices of copper and aluminum wires, the conductivity, tensile strength and other proportions of the aluminum wire being only considered as determining its relative price. During the past year the manufacturers of aluminum have demonstrated their ability to sell this wire at a price well below twice the price of copper per pound, and in consequence the new material has forced itself upon our notice and has demanded that we consider carefully all of its properties independent of any consideration of price. Having recently been forced into the purchase of a considerable amount of this wire by reason of the high price of copper and the low price of aluminum, the writers have made a careful study of the wire supplied, and now present the results obtained, in hope that they may be of service to other engineers.

Some of these results have already been published,† but in these publications there have been so many misprints that it seems advisable to present the whole matter anew. The line for which this wire was purchased is about 43 miles in length, and the country through which it runs varies in elevation from about 100 feet above the sea level to at least 2000 feet; one-half lying in a straight line through a country almost level, while the remainder is over the mountains, through which the line runs almost straight, surmounting high hills and descending into deep gulches. In some cases the length of the poles was proportioned to decrease the vertical line deflection, but as an accurate preliminary survey was not available, much less grading of poles was possible than would have been desirable. This defect in pole setting was largely counteracted in the wire stringing by drawing a number of plans at one time, so that at depressions and elevations there was very little up or down strain put on the wire when it was first tied to the insulators. The standard pole used was of square-sawn redwood, 30 feet in length, 7 inches square at the top, and tapering to 12 inches square at the butt, or about 11 inches at the ground line 5 feet above the butt. Each pole was gained for three cross-arms 20½ inches on centers, the gains being cut ¾-inch deep, into which the cross-arms were bolted by single ⅝-inch through bolts. The arms themselves were 4x4-inch Oregon pine bored for two pins each, the top and bottom arms being 3 feet in length and the center arm 4 feet. The wires on this system of construction are arranged in a hexagon, each side being 24 inches in length.

This system of construction presents some advantages for three-phase working at high voltages for long lines, especially where the two sets of circuit are to be operated from the same bus bars. If both the wires on each arm are at the same potential, the arrangement of each circuit is that of an equilateral triangle, each side being 41 inches, while the minimum distance for leakage between any two wires of different phases is 36 inches of cross-arm and 20 inches of pole, while the length of the longest arm necessary is much less than that in any other system of construction; the pole head is symmetrically loaded, and for these reasons the pole construction is exceptionally stable under all stresses.

The insulators used were a flat-topped glass, triple-petticoat type, about 5 inches in height and 7 inches in diameter, with a wire groove of about .35 inch radius. The insulators are supported by eucalyptus pins of a length to give a distance of 4 inches between the bottom of the insulator petticoat and the cross-arm, eucalyptus wood having been used on account both of its availibility in California for a special pin, and on account of its great strength, which is of extreme importance in the construction of pins of such length.‡ For further insulation and preservation, the cross-arms used were creosoted by a treatment in which the timber was at first dried carefully and then injected with ten pounds of dead oil of coal tar to the cubic foot, an operation requiring approximately thirteen hours for its completion, while the pins were boiled at a temperature of about 225° Fahr. for about eight hours in a compound of coal tar and asphaltum, a treatment which gave a better external surface than the creosote. This latter coating did not penetrate the wood materially, but after experimenting extensively with temperatures up to 225° Fahr. and pressures up to 160 pounds per square inch, without effecting an appreciable penetration of this wood, either with creosote or other extremely fluid materials, all idea of the use of a penetrating compound was abandoned, and an endeavor made to obtain a coating which would provide the most complete external protection.

On this line as erected the arms were braced by a bent angle iron brace, but this precaution seems now to be entirely unnecessary, and a subsequent line, belonging to the Yuba Power Co., erected on much the same plan, is not braced at all. For arms of over 5 feet in length a brace is certainly advantageous, though it is the opinion of the writers that for high potential service the braces should be of wood mortised into the cross-arms and nailed to the pole face.

The above complete physical details of the construction are unnecessary for the discussion of aluminum line wire, though it is believed that its stability when erected depends upon a careful study of all such conditions.

The line as erected carried only four wires, arranged on the top and bottom cross-arms, thus taking their location at the corners of a rectangle 24 inches on the short side and 41 inches on the long side. This arrangement was adopted for the purpose of making temporary use of some two-phase machinery which was in place and underloaded, allowing certain new customers to be taken on quite a year in advance of the contemplated completion of a three-phase plant for which the pole line was really designed.

It was at first feared that this arrangement of the wires would result in inductive disturbances between the phases, as the wires took their positions in the diagonally opposite corners of a rectangle, in place of the corners of a square, as is necessary for complete absence of mutual induction, but the anticipated trouble was not found. Careful measurements were made with one phase short circuited, and the other carrying about 20 amperes with a periodicity of 60 cycles per second, both with a Weston 75-volt voltmeter a Rowland electro-dynamometer, with the result that no deflection was observable on the voltmeter, while the current read on the electro-dynamomometer amounted to only about .001 ampere, the resistance of the dynamometer being 25 ohms and of the line 90 ohms. Only one additional question of installation needs attention, which is the presence on the tops of the poles of a barbed wire stapled to the wood of the pole and grounded at every fourth pole by a galvanized wire leading down along the pole and soldered to an iron plate 18 inches square and ⅛ inch thick, set in the pole hole immediately under the foot of the pole itself. This wire was intended as a lightning guard, and it has apparently done very effective service in discharging the line in all weather.

(TO BE CONTINUED.)

* Abstract of paper read at the seventeenth general meeting of the American Institute of Electrical Engineers, Philadelphia, May 16, 1900.

† "Tests and Calculations on a Forty Mile Aluminum Transmission Line," F. A. C. Perrine, Pacific Coast Transmission Association.

‡ Tests of a considerable number of pins made of eucalyptus, oak and locust show that the eucalyptus has about 20% more strength than locust and 30% more than oak.

MINING SUMMARY.

ALASKA.

Vessels still leave for Cape Nome crowded to the safety limit, and leaving behind freight and passengers impossible to take. The Klondike hegira of '97 is outdone. In San Francisco everything in the way of "Cape Nome outfit" is prominently advertised. The rush will continue through June.

N. R. Smith, deputy land and mineral surveyor at Cape Nome, is down from there, coming out over a new land route. He left Nome March 16th, went on foot with one companion across the country from the Kuskoquim river to Katmai, a coast port on the mainland, opposite Kadiak island; left Kuskoquim river on April 10th, dropping the dog team which they had used on the trail from Nome, to allow a thorough survey of the country.

Katmai was reached May 8th, and in bidarkas, a variety of canoe in use by the coast Indians, the two took the open water to Kadiak, thence by steamer Bertha.

Mr. Smith says: "People on the outside can not realize the extent of the valleys, beach, tundra and mountains included in the Nome district; the area of the country in which rich strikes have been made extends 70 miles back from the beach at Nome and 270 miles east and west. Gold has been found in creeks prospected north to Cape Prince of Wales. Fully 3000 men spent the entire winter in prospecting and locating claims.

"A strike on Ungalaltolik going 80 cents to the pan was reported in February. This is east of the Norton bay country. The two creeks which have been opened so as to give a fair idea of their real character are Bryan and McKinley, between Golovin bay and Norton bay. Other strikes and locations have been made in the Anaconda district.

"Old Russian workings have been found in the Golden Gate district. Quartz has been found on the Kusrikne, a tributary of the Ammain river, flowing into Graneley harbor, in the Port Clarence district.

"To the north among strikes may be mentioned discoveries on Mint and Grouse creeks in the Arctic district, back of Port Safety. Just before I left lots in the town were selling for $2000. It is expected that Port Safety will be the salt-water entrance into the Cape Nome country. Last year there was a great amount of goods lost or destroyed through lightering it ashore to the beach at Nome; it is a tiresome and costly job.

"A peculiar feature of the platting of the Nome townsite occurred this spring. The Anvil district had already organized as a municipality and a regular board of trustees was appointed to look after the little town's affairs. The surveyors who were platting the Nome townsite took in all of Anvil, two square miles, and labeled it as a part of Nome. Anvil had already platted streets, located and disposed of town lots, had town officials at work, but is now what could virtually be called a prisoner within the limits of Nome. It is all called Nome, but there are perhaps yet two sets of city officials, one looking after the affairs of Nome and the other after the interests of what they yet term Anvil.

"Lumber when I left Nome was selling at $500 per M., and even at that figure there was a great demand for the article. The MINING AND SCIENTIFIC PRESS sells at $1 per copy.

"Interest is shown in the Penny River district. The old mouth of Anvil river is said to have formerly made its way to the sea, and is thought to lie somewhere near where the Penny river makes its way through the tundra; and if such is the case, rich diggings will be found there.

"The ruby sand along the beaches has been found to contain gold. The clay deposits also contain gold, and in places the strata are from 4 to 5 feet in width.

"Quartz strikes have been made all the way from Norton bay to Cape Prince of Wales.

"Developments on Tundra this spring have shown that that section will eventually produce gold; that the tundra has been built up by the action of the ice. The dirt and silt which forms that section has been worked away from the mountains and foothills to the beach, where it has been gradually packed and worked back by the action of the ice floes, which enclose Bering sea from the outside world during the long winter. The action which eroded the dirt from its original resting place in the mountains has also worked out with quantities of gold, and this is the gold found in the tundra at the present day."

The weather conditions at Nome since the last advices were unusually favorable. During February the thermometer averaged from 7° to 34° above zero; March 12th it was 10° below.

The Alaska bill makes no change in the mining laws as regards location by power of attorney. The United States mining laws are extended to the district of Alaska. The beach between low water and the tundra is made subject to regulation by the miners themselves, provided such rules and regulations do not conflict with the general mining laws. The Secretary of War has jurisdiction below the low water line, but may not grant an exclusive franchise for dredging to any one party or corporation.

The conferees on the Alaska code bill this week reached a complete agreement, the mining provisions being so adjusted that miners may continue to mine between high and low tide and to dredge under the bed of the ocean according to rules to be provided by the Secretary of War and on condition that they are citizens or have declared their intention of becoming citizens.

At 4 P. M., June 6, a message from the Senate announcing the passage without amendment of the House bill to extend the gold land laws of the United States to the District of Alaska was greeted with applause.

H. I. Willey, formerly Surveyor-General of California, has gone to Cape Nome, with an outfit of machinery and supplies, to be used in working 360 acres of placer ground owned by the Emanepac M. Co., of New York.

The current monthly report from the Alaska-Treadwell, on Douglas island, shows 46,419 tons ore worked by the two mills, the one of 300 stamps running twenty-nine and three-fourths days and the one of 240 stamps eight and one-third days. The ore yielded $95,237. There were 839 tons sulphurets served, valued at $35,116, making the gross earnings for the month $130,353. The expenses were $31,500, making net proceeds $98,853. The ore averaged $2.95 per ton.

ARIZONA.

COCHISE COUNTY.

The body of copper ore in the Spray mine, one of the Copper Queen group at Bisbee, is asserted to be the richest that company has ever found on its property.

GILA COUNTY.

C. F. Lucas, at Ray mines, has the contract to do all the work on the company's mines, and will put on sixty men. The Ray Co. will start their mill this week.

The Black Warrior Copper Co., Amalgamated, is building a reverberatory furnace in place of its ten-ton refining furnace; the new reverberatory can also be used for refining. The company has made a strike of sulphide ore on the Gold gulch property, west of Black Warrior, at the water level. The ledge is 16 feet wide; the ore is black sulphide, and pyrites of copper, the right kind for making acid. Forty men are building a road to the Gold gulch property.

MOJAVE COUNTY.

W. Mellarkey and party of miners have gone from Randsburg, Cal., to the Sheep-trail mine, 35 miles from Kingman. Mr. Mellarkey has the superintendency of the mine; the others will work there.

YAVAPAI COUNTY.

Carl Kurtz writes the Courier from Martinez: "I am running the War Eagle mine, down in the Harcouvar mountains. I am shipping ore by the carload to Eastern smelters, and have a 20-stamp mill ordered for the reduction of lower grade ores. Ores in this section carry a high percentage of copper and gold, and ledges are large. We will have a railroad through here in about a year."

Kurtz says when he first started in on these properties he paid $5 per barrel for water delivered on the ground, but within two miles he expects to be able to develop sufficient water for a 20-stamp mill at the present dry season. He says he counted sixty-three claims in that district that could produce shipping ore if the owners could get the ore out for any reasonable freightage.

The Gilbert correspondent of the Prescott Prospect says: "The Saginaw Lumber Co. is running forty tons of ore through its mill every twenty-four hours. It is the intention of the company to add fifty stamps. There is plenty of water on the property for all purposes."

Courier: Work has begun on the Gray Eagle mine, three miles from the Crowned King.—A bar of refined gold, weighing 180 ounces, from Minnehaha Flat, came from the Button mine, ore run through the Button mill.——The mill of the Penn M. Co. is running steadily, five carloads of concentrates have been shipped. There is talk of doubling the capacity of the mill.——The ore from the Tiger mine, supposed to carry only silver, plated $5 in gold when run through the Tiger mill—enough to pay all expenses. Ten more stamps will be added to the mill.

YUMA COUNTY.

Men are at work building a dredger boat for the Advance G. D. Co. of Colorado Springs, which owns a deposit of gold-bearing gravel in the Potholes district, 12 miles above Yuma, on the Colorado river. The dredger will cost $30,000.

The King of Arizona mine now employs 100 men, a steady gold producer.

CALIFORNIA.

AMADOR COUNTY.

F. Hutchins and W. A. Newcum are developing a copper proposition at Ranlett.

At the Lincoln mine ore is being taken from the 500 north drift.

A strong company has been organized to work the Toman property, adjoining the South Eureka on the east.

BUTTE COUNTY.

(Special Correspondence).—Except in the matter of dredging enterprises along the Feather river, there is a lull in mining development here. Probably this condition of affairs is temporary, as there is undoubted merit in the quartz locations which abound in the mountain region.

The Banner ledge, 4½ miles northeast of Oroville, is a slate formation. Work on the ledge in this location has been discontinued. The company is developing the Amosky quartz vein. The incline shaft is down 450 feet on the vein. Thirty men are pushing development. A tramway will be built from the mouth of the shaft to the 40-stamp mill which formerly reduced Banner ore. The mill will be started as soon as connections can be established with the Cherokee water system. About 2 miles of ditch, flume and tunnel will be put in to get this connection. The work will be completed in September. Then a larger force will be put into the mine. The Banner is an English corporation, whose interests are well attended to in Oroville by Lindsay Scrutton, superintendent. I. Trenberth is foreman of the mine.

The Gold Bank quartz mine at Forbestown employs more men at the present time than any other mining enterprise in Butte county. There are seventy-five to eighty men on the payroll of the company. The growth of the Gold Bank has been evolutionary in its character. Its beginnings were small, its accretions have been gradual, and we now see the survival of the fittest in its system of ore reduction. The buildings are on the mountain side, in deep Ford ravine. The collar of the shaft is nearly 800 feet below the surface croppings of the ledge at the crest of the hill. The shaft runs down on the ledge (at an angle of 30°) to a depth of 400 feet. Here connections have been made with an upraise from lower workings. This upraise is one of the longest in the State—1200 feet—and has few parallels in the history of mining. It was started from a crosscut tunnel, which extends from the ravine to the ledge, a distance of 1260 feet. First put through as an air shaft, this upraise is now being enlarged to a two-compartment shaft, and drifts are being run at the various stations established. When it is considered that the ledge in the Gold Bank an average thickness of 10 feet, the extent of development by means of this upraise may be realized. From the surface croppings of the ledge to the level of the tunnel 2400 feet of vein matter has been penetrated by shaft and upraise. The management is certainly warranted in enlarging the crushing capacity of its mill. Work under the superintendence of Millwright Wm. Powning of Grass Valley has been begun on a 20-stamp addition, which will make sixty stamps in all. Few additional men will be needed in the mine to supply the enlarged mill, as the ore breaks readily. The chlorination plant will be able to handle without enlargement the increased quantity of sulphurets, and as little additional help will be required in the mill the average cost per ton of reducing the ore product will be materially lessened. The motive power at hoist, mill and air compressor is water, under heads of 175, 225 and 350 feet, respectively, the compressor being located in the ravine, below the mill. Compressed air for drills in the mine is now taken through 4000 feet of pipe. Later the pipe line will extend from the mouth of the tunnel to the workings above, and can thus be shortened. Water for power purposes is supplied by the Feather Water Co., 180 miners' inches being used. There are six main and several auxiliary water wheels in different parts of the works, it being the practice of the company to run no two classes of machinery from the same wheel. After being hoisted the ore is dumped upon grizzlies and the coarser part goes through a Gates rock breaker. Then it is run 450 feet in cars over a tramway to the mill. The value is largely in concentrates. Besides sixteen Frue concentrators in the mill, the tailings are run over two sets of blankets. The chlorination plant has a capacity of four tons per day. The present mill crushes 320 tons of ore per month. A small dynamo generates current for lighting the mill and grounds by electricity. The Gold Bank was one of the first mines in the State to inaugurate this feature, having installed a lighting plant in 1892. The Gold Bank mine is owned by the Stow estate. H. P. Stow of Forbestown is manager, Vanderlyn Stow of San Francisco is secretary, L. B. Johnson assistant superintendent, L. G. Hampton foreman, Ed Martin and James Hampton shift bosses, E. W. Herrin assayer and foreman of chlorination works. At present the activities at Forbestown are almost entirely dependent upon the Gold Bank mine.

The old town of Cherokee will ere long assume an aspect of activity. The Spring Valley hydraulic mine, which was closed down through injunction proceedings several years ago, will, through permit from the Debris Commission, resume operations. Ground has been broken for a restraining dam in Dry creek, several miles below the diggings. There is here an ideal dam site. By means of a barrier 16 feet high and 1720 feet long the tailings from the mine can be spread over an immense area of the company's own land. The dam will be constructed of brush and tailings now on the ground. It will be 80 to 100 feet wide at the base, narrowing to 16 feet on top. A spillway 80 feet wide will be cut through a solid lava bank at the side of the dam. The Dennison Contracting Co. of San Francisco will construct the dam for the new Spring Valley Co., which is composed of Pittsburg, Pa., business men, the leading stockholder being A. W. Mellon of the banking firm of Mellon & Sons. The company owns an excellent water system, purchased with the mine, the water being diverted from streams at elevations of 5400 and 3400 feet above sea level. There will be a fall at the hydraulic monitors of 350 feet. That portion of the old diggings known as the Sugar Loaf will be hydraulicked. The gravel stratum under Table mountain will be worked by the drift process. The restraining dam should be completed, according to contract, the fore part of August. L. J. Hohl is present superintendent of Spring Valley, C. Helman foreman of mine, A. Hiller accountant. The Dennison Co. is to receive 15 cents per cubic yard for building the embankment; 24 cents per cubic yard for excavating spillway; extra haul, 2 cents per cubic yard for each 100 feet; paving spillway, 60 cents per square yard.

Oroville, June 5.

CALAVERAS COUNTY.

The Poorman mine, at Glencoe, is reported taking out good ore in an 8-foot vein in north level and between 5 and 6 feet in south level.

P. Deidesheimer, the mining promoter, is working the Masterson property, near San Andreas.

The Melba mine, at Chili Junction, has resumed. K. Whitfield has charge.

EL DORADO COUNTY.

At Grizzly Flat, Brown Bros. of Oleta have bought the Mt. Pleasant mine.

FRESNO COUNTY.

The Kern River Co.'s oil well No. 1 at McKittrick is now free of sand, and pumping 150 barrels per day. The oil is forced through pipe to the station, 3 miles away.

KERN COUNTY.

A new pump, operated by compressed air, is to be tried in the Kern River oil oil fields. It is claimed that the compressed air piped and let down into the oil will drive up oil, sand and all contents of the well.

LOS ANGELES COUNTY.

In the really earnest development of the petroleum resources of the Newhall district, the Pacific Coast Oil Co. in the Pico canyon section has about sixty oil wells on 160 acres. The company is reported as being assessed for 3000 acres. Its operations outside of the Pico canyon are chiefly in the Wiley canyon, 6 miles from Newhall.

At San Pedro the Dodson Oil Co. will sink a well. The Oil Era says: "The oil fever is strong along the coast, and practically the entire shore from Long Beach to Redondo is reported tied up for alleged oil prospecting purposes."

MONO COUNTY.

Bridgeport Chronicle-Union: The Jackson, Lakeview and May Lundy mines at Lundy have passed into the hands of a Colorado company, the old Supt., R. T. Pierce, being kept at the helm. Mr. Pierce has let a contract for 400 large tamarack poles for an electric line, the new company intending to run the works by electric power. The cyanide plant commenced work this week, and a new tunnel, 2700 feet in length, is to be run.

NEVADA COUNTY.

A representative of the Risdon Iron Works, San Francisco, last week visited Grass Valley and Nevada City for miners to go to Hawaii. Twelve were engaged for $3.50 per day and board and expenses to their destination.

Messrs. de Sabla, Grow, Hotaling, Martin, Pierson, Sutro and Linforth have incorporated the Bay Counties Power Co.,

capital stock $5,000,000, to buy and combine the Nevada County and the Yuba County Electric Power Cos. and supply sundry places with light and power.

Eastern men have a bond on the Work and Pay gravel mine, east of Nevada City, for $25,000. They intend to put in modern machinery and sink to the main channel.

ORANGE COUNTY.

The Union Oil Co. is reported to have struck an oil gusher in Brea canyon at a depth of 365 feet.

The Golden West Crude Oil Co. is drilling at Fillmore, in charge of A. Ward.

SAN BENITO COUNTY.

Several oil companies are operating in the Panoche district.

One hundred men are employed in the quicksilver mines at New Idria.

A quicksilver mine is being opened near Emmett.

SAN BERNARDINO COUNTY.

The foundation is being laid for the proposed new smelter at the Needles.

SAN DIEGO COUNTY.

Near Oceanside, the Copper Queen mine has been sold to an English company formed in San Diego.

SANTA BARBARA COUNTY.

The Ocean View Co., in the Casitas district, has struck oil sand at 250 feet. Prior to reaching the oil sand, 50 feet of blue clay was passed through. Before stopping 18 feet of oil sand was bored.

SHASTA COUNTY.

(Special Correspondence).—The Evening Star mine, in Old Diggings district, is shipping ore to the smelter at Keswick. There are seven men employed at this mine.

The Texas Con. mine at Hart made a five-carload shipment of ore to the Keswick smelter. Woodrow & Bush are operating this property and employ thirty-five men.

At the Black Spider mine, near Keswick, sinking the shaft and drifting continue. The former is 140 feet deep and the drift is about 120 feet long. Sixteen men are employed.

The Reed mine, in Old Diggings, has reverted from the bonders to the owners, and work is in progress. The property comprises six claims.

The Mt. Shasta mine, near Shasta, has again resumed ore shipments and sinking is in progress. The shaft is about 340 feet deep.

Adjoining the Central mine at Whitehouse, which has long been idle, the Joshua Hendy Co. are working the Old Spanish mine, which was long abandoned.

The Little Providence, near Whitehouse, at 35 feet depth, has opened a 6-foot ledge that averages $5 a ton.

The Minnesota, near Copley, and the Dry Creek Slide mine, near Keswick, operated by D. McCarthy, are both producing ore.

At the Bennington, near Iron mountain, Williams & Bunker have completed a tramway siding and ore bunkers and will soon be shipping ore over the Mountain Copper Co.'s road to Keswick. They have fifteen men employed.

Redding, June 5.

Democrat: The company that has been working the Uncle Sam mine, near Kennet, for some months past, under a bond, have ceased operations and the men that have been employed are discharged. Since the company took the bond on the Uncle Sam work has been continued in the mine and from ten to twenty stamps dropping all of the time. Good ore has been milled and new bodies of ore have from time to time been uncovered. The bond will expire on July 1st, this year, and, as the company can not secure an extension, they will consequently cease operations. The Uncle Sam profited the Sierra Buttes Co., its former owners, something over $1,500,000. They ceased operations on the property at a time when the mine showed a weakening, or did not continue to pan out such big returns. The mine never has "petered out" in the strict sense of the term, and some one will yet get hold and reclaim it as a great gold producer.

SIERRA COUNTY.

M. Barnhart is at Alleghany arranging for a 20-stamp mill on the Red Hill mine.

SISKIYOU COUNTY.

Yreka Journal: E. D. Baker, working the Cherry Hill quartz mine on Cherry creek, lately bonded for $25,000, found a body of ore with sufficient in sight to pay first installment of $10,000. He has twenty men employed.

TUOLUMNE COUNTY.

Near Quartz, the Dutch mine is running its 20-stamp mill, hoist and rock breaker with electric power.

The reorganization committee of the Santa Ysabel G. M. Co. has issued a circular to the stockholders, stating that it has been organized, under the laws of Colorado, to acquire their properties, and inviting them to surrender certificates by June 9th to its treasurer, and at the same time pay him $1 for each share.

The Arrow, north of Soulsbyville, is under bond to Chas. Fair of San Francisco, and ore is being developed.

Near Carters, the Neale, or Sugarman, in ten days of May yielded 600 ounces gold. The mine is worked by Watson Bros., and is owned by J. Neale, Sonora, Cal.

The Grand View gravel mine, near Jamestown, has resumed operations. C. E. Ayers is Supt.

Independent: A $10,000 pocket was taken out this week at J. H. Neale's mine on Bald mountain. A few weeks ago a gold seam was struck in the tunnel and several hundred dollars extracted. Work was continued and an upraise was run on the gold seam. The vein widened out and the rich bunch of gold was encountered. The tunnel has been driven in 800 feet. The present yield aggregates 550 ounces.

The Densmore Con. G. M. Co., directors A. Hayward, C. D. Lane, L. W. Shinn, C. W. Fox of San Francisco and J. P. Hopkins, capital stock $200,000, will work the Densmore mine, under superintendency of Mr. Poundstone.

COLORADO.

BOULDER COUNTY.

(Special Correspondence). — The Cold Spring G. M. & T. Co., composed of Illinois men, are driving the Craig tunnel, on the Bordeaux, to tap their properties at greater depth. They will build a mill at the mouth of the tunnel.

The Slide is at present worked mostly by leasers, who are all making wages.

The old Prussian mine, owned by Mr. Newhouse, has made a new strike.

The Nugget mine, a free gold proposition, has completed arragements to build a 10-stamp mill.

The management of the Lucky Star is sinking the main shaft and have a 2-foot streak of shipping ore.

The Golden Eagle has opened up some tellurium ore.

Gold Hill, June 4.

Manager W. B. Bailey expects that the sampling works of the Eldora chlorination mill will be ready for operation June 15.

CLEAR CREEK COUNTY.

The Republican reports that the old Senator mine at Dumont has been sold to New York men for $100,000, who have let a contract to the Colorado Iron Works for a concentrating mill, to have an initial capacity of fifty tons every twenty-four hours, operated by water power. Rolls and Bartlett tables will form the equipment. In addition, a Finlayson tramway 2300 feet long will connect the mine with the mill. The ore will be handled automatically.

DOLORES COUNTY.

"Fifty miners can secure employment in the Rico district at once," says the Rico News-Sun.

GRAND COUNTY.

In the vicinity of Red Cliff mining on Battle mountain is progressing. At the Iron Mask mine the lower sulphide streak was found again by sinking a winze at the old pump station in the incline, hundreds of feet from the original strike. The carbonate belt is getting bigger. The Newhouse tunnel is making headway. The mine is under the management of F. F. Harrington.

J. T. Hart at the Percy Chester Con. is employing twenty-five men.

Manager Porterfield at the St. Joe has the mine drained, laterals cleaned and has opened a body of sulphide in the breast.

GUNNISON COUNTY.

Near Ohio City Supt. Sinclair has eighteen men at the Chloride. The ore runs $100 per ton and the property is shipping regularly, the ore being hauled to the D. & R. G. and shipped to the Pueblo smelters.

Supt. Roe has ordered a hoist for the Cortland. A compressor is to be added.

The Pittsburg-Gunnison Co. is operating its Granite Mountain property. Manager Wilson is also working the West Point, a property which he recently bonded and leased.

Peterson & Mosely have sold their lease on the Eureka mine, on Lake hill, Gunnison mining district, to D. C. Tobin of Leadville. He will employ twenty men. He has a bond upon the property from the owner, the American Smelting Co. of Leadville, for $25,000. The mine has shipped about 2000 tons of lead carbonate ore running $30—a favorite ore, as the smelters do not charge for treating it.

The Tomichi Valley smelter at Cosden is a success and will handle nearly all the ore from the Tomichi district.

At Vulcan the hoister selected by Dr. Weiss for the Good Hope mine weighs 14,000 pounds. It is 10x15, guaranteed to sink to a depth of 1000 feet.

LAKE COUNTY.

O. C. Bartholomew, manager Sedalia mine, Leadville, reports two new strikes in the drift from the 700-foot level. The ore now being taken out runs from $6 to $12 gold, $2 to $4 silver and 7% to 10% lead, making an average of about $18 per ton.

General Manager Duvall of the Boston Gold-Copper Smelter, near Leadville, will enlarge the plant.

Manager Estey of the Rialto M. Co. will drain the Pyrenees shaft. The pump will raise 900 gallons a minute from a depth of 1000 feet.

Leadville Miner: The Banker shaft has reached the 1100-foot point, has been sunk nearly through the hard quartz porphyry and a softer gray porphyry has been encountered in which bunches and seams of sulphide ore are being found. Many of the largest bodies of gold ore in the camp are found at the junction of two different kinds of porphyry.

OURAY COUNTY.

Near Ouray the Ouray H. M. Co. has struck ore running $50 to the ton.

Work is about finished on the new mill for the American Nettie, near Ouray.

Several men are at work on the Calliope. The Chicago purchasers have $40,000 for development work.

The Hammond Tunnel Co. has sixteen men at work. The tunnel is in 1000 feet; 10 feet are worked every day.

PITKIN COUNTY.

Manager Palmer in his quarterly report on the Argentum-Juniata shows that in the mine (a low-grade proposition depending solely upon the price of silver) the milling ore produced during the quarter has averaged $1.74 per ton gross higher value than that of the last quarter, resulting in a small net profit over operating expense. The cost of mining, milling and shipping has averaged $5.05 per ton gross of milling ore, as against $5.46 for the last quarter, the lower cost being principally due to the greater tonnage mined and milled during the quarter.

SAN MIGUEL COUNTY.

C. Bullock has in Denver two gold bars from the plates of the Butterfly-Terrible mill at Ophir, weighing 166.63 ounces, valued at $2400. He employs forty-five men, turning out fifty to sixty tons a day. The vein averages 2 feet in width. The ore is stamped by the rapid drop system.

TELLER COUNTY.

The output of gold from the mines of the Cripple Creek district for May was $2,000,000.

The Consolidated Mines Co. paid $20,000 to the Alert Co. for its lease on the Diamond and Harwood claims of the Damon Co.

The Legal Tender has closed down its workings to give opportunity to enlarge the shaft, put in a bigger plant and make other improvements which shall make possible larger production.

The Times-Citizen says the Logan is to have a 24-drill compressor and a new 22x36 hoist, good for a depth of 3000 feet. ——The Longfellow is to have a hoist 16x30, good for a depth of 1500 feet.——In Poverty gulch a hoist 20x30, good for a depth of 2000 feet, and a compressor have been ordered.——The Woods shaft on the Morning Glory property is down 700 feet. From bedrock up almost to the collar of the shaft the timbering has been surrounded by a masonry wall of granite.

The Elkton, Raven and Tornado stockholders have ratified the purchase of the Raven and Tornado mines by the new Elkton Con. Co. Stockholders of the Raven Co. received 625,000 shares of the Elkton Con. stock; the Tornado stockholders received 625,000 shares of the Elkton Con. stock. The Raven and Tornado companies turn in all their assets to the new company, the Raven Co. having $40,000 and the Tornado Co. $50,000. The Elkton Co. contributes its treasury balance of $162,149, so that the new company starts out with $252,149 in its treasury. The Elkton Co. has increased its capitalization from $1,250,000 to $3,000,000.

IDAHO.

BEAR LAKE COUNTY.

The Bear Lake Copper Co., capital $1,000,000, has been incorporated in Lewiston; the property is in Bear Lake county. The ore body exposed, 25 feet in width, carries copper value of 5%; assays also show $3 in gold per ton. Owing to the proximity of the property to Salt Lake City it is figured that the ore can be delivered at the smelter in that city for $4.50 per ton.

IDAHO COUNTY.

(Special Correspondence).—The name of the Esperanza M. Co. is to be changed to the Laymance M. Co.

M. D. Hall of Stanford, H. H. Harvey of Berkeley and S. K. Bradford of San Francisco are working the Republic properties. The ore has an average value of $15; a cyanide plant will be put in.

Elk City, May 29.

G. I. Porter, Mgr. American Hill placers at Elk City, says the American Hill, Buffalo Hill and Ternan Hill placers are being operated successfully. On the American Hill the hydraulic elevator is running satisfactorily; he is running two giants and working ten men. He has opened up ground where the gravel is from 40 to 100 feet in thickness. The quartz has a greenish cast, and was first supposed to contain copper. Mgr. Hunt is reticent. A peculiarity of the May Day is that the gold and silver ores also carry a high percentage of lead, making them a desirable product.

SHOSHONE COUNTY.

In the Cœur d' Alenes the average daily prouction from ten leading producers is figured as follows:

	Tons.
Bunker Hill & Sullivan	1,000
Morning	700
Frisco	750
Standard	700
Tiger-Poorman	500
Mammoth	300
Hunter	200
Last Chance	200
Hecla	150
Silver King	60
Total	4,560

Of this 4560 tons, says the Wallace correspondent of the Spokesman-Review, but a small part is shipped in the shape it comes from the mine. The Last Chance and Silver King are the only mines where much attention is paid to crude shipments. The great majority of it goes through one of the mammoth concentrating plants of the district, and by the time it is ready for shipment the weight has been reduced to 700 or 750 tons.

The value of ore from the different mines varies so widely that it is hard to determine the average, but the net profit for each ton will probably not be far from $8. To mine, mill, haul and smelt the ore costs about as much more.

Aside from the Sixteen to One, which will soon resume operations, and an increase a little later of from 25% to 50% in the output of the Hecla, there is little likelihood of any considerable increase in the daily product this year. Several new properties will probably ship, but it will be on a small scale, affecting the aggregate but little. By the end of the year there should easily be 5000 tons mined daily, but unless there are new discoveries made it will not greatly exceed that.

WASHINGTON COUNTY.

Weiser reports 200,000 pounds of peacock copper ore freighted to the terminus of the Pacific & Idaho Northern Railway at Cambridge from the Blue Jacket mine. This ore is shipped by team over 60 miles and then by rail to New York City for treatment. The new Seven Devils Railway is completed to Cambridge, 40 miles from Weiser.

MONTANA.

FLATHEAD COUNTY.

The Choteau M. Co. has organized to operate the Choteau and Silver Standard mines on Cable creek, headquarters at Libby; W. A. Hillis, secretary and treasurer. The Choteau is an extension of the Silver Cable; the values are in gold, silver and lead.

Near Libby, at the Snowshoe mine, the main tunnel is in 2000 feet, and has yet to be driven 900 feet to get through the mountain. Shipping ore is taken from the No. 4 tunnel and men are at work in every opening.

JEFFERSON COUNTY.

The New Elkhorn M. Co., W. S. Kelley Supt., has sold its property at Elkhorn to George H. Piatt of Helena for $9000. The sale includes the four quartz claims of the company, twenty-five acres of ground located as placer, the millsite, certain lots in the town of Elkhorn, the mill and other buildings, and the water rights of Elkhorn and adjacent creeks, flumes, ditches, etc. The price is in noticeable contrast to that paid for the property when it was purchased by the English company from Holter and others in 1888, the price then being $1,000,000, of which $500,000 was in cash. It was a high-grade silver proposition and for several years it paid large dividends; in fact, it is currently stated that the mine paid for itself in the first three years of operation by the new company. In working the property the incline shaft went down 2300 feet, causing a considerable expense in handling the ore and in pumping water. The ore became less rich, silver went down in price and it was finally concluded by the company to cease working the property. This was done a few months ago. The machinery was shipped away and the mine was allowed to fill with water, which it did up to the 900-foot level.

MADISON COUNTY.

At Pony the Garnet G. M. Co.'s mill is in operation. The company contemplates a tunnel near the bottom of the incline, or will sink a shaft and put in a hoist and

pump. Mr. Wood, the resident manager, favors the former plan.

T. Lewis, foreman Madisonian mine, Sheridan, says he has begun sinking a three-compartment shaft from the 300-foot level, to go 200 feet deeper.

SILVER BOW COUNTY.

O. B. Peck, who did some costly experimenting in Nevada, has bought the Blue Bird 10-stamp battery and will experiment further on the Butte low-grade silver ores.

Last Saturday Judge Knowles of the United States Circuit Court handed down his decision in the case of the Colusa-Parrott Co., owned by W. A. Clark and the Anaconda Co., controlled by Marcus Daly. The suit hinged on the question of a union of the veins of the Colusa-Parrott and its connection between the 800 and 1000 levels of the mine with those of the Anaconda. The suit was to recover ore that the Anaconda people had extracted from the part below the alleged union. The court finds for the Anaconda Co., holding there are two distinct veins.

The Anaconda C. M. Co. has cancelled all its mining leases and will hereafter operate its own properties.

NEVADA.

EUREKA COUNTY.

The Zanoli mine at Safford, 6 miles west of Palisade, is sold to S. H. Gibson of Salt Lake City for $50,000. The mine carries silver, gold, lead and copper, and has been shipping ore for three years. The sale includes about 800 tons of ore now on the dump.

LINCOLN COUNTY.

At Searchlight, Gen. Mgr. H. R. Bacheller of the Quartette M. Co. has stopped work and gone to Mexico.

James McFarlane, manager of the Homestake and other properties at Deer Lodge, says that he will have the mill in operation within the next thirty days, and that he will handle at least 150 tons of ore daily. He expects to show an average of $20 per ton.

At Searchlight, work at the Quartette Co. mines is progressing under the direction of Supt. McReady.

NEW MEXICO.

SANTA FE COUNTY.

New Mexican: "The Edison experimental placer plant at Dolores is running continuously, but none of the employes lets his left hand know what his right hand doeth, as it were. A high fence has been erected about the works in order to bar out the curious."

SIERRA COUNTY.

The Porter mill at Hillsboro has closed down for repairs.

A pocket of 1600-ounce silver ore is found in the winze below the 100-foot level of the Log Cabin mine, Tierra Blanco.

SOCORRO COUNTY.

T. J. Fleeman has a mine at Kelly that carries 60% lead ore and thirty-five ounces silver to the ton.

The Little Fannie at Mogollon will erect a 40-stamp mill.

The Last Chance mine at Mogollon has four carloads of machinery. The company is running the tunnel an additional 100 feet.

The Silver Bar mine at Mogollon will sink its shaft another 50 feet. The monthly output will be 150 tons.

TAOS COUNTY.

At Rinconada the Copper Hill M. Co., J. K. Turner manager, has sixty-five men at work. The company—New York capitalists—has spent $200,000 on the group. The electric plant recently constructed has been started and the mine, mill and camp are illumined by electricity. Four air drills are in operation. A 6-mile pipe line of 7-inch pipe has been constructed at a cost of $30,000.

OREGON.

BAKER COUNTY.

In the Diadem mine, at Sumpter, Supt. Grimes reports a strike at a depth of 400 feet, indicating permanence of the ore body.

In Greenhorn mining district gold gravel is reported yielding $5 nuggets.

UTAH.

JUAB COUNTY.

Tintic Miner: The May Day strikes have come from practically one stope opened up to 100 feet below and 40 feet above the tunnel level. In the "gold stope," on the 100-foot level, a vein of quartz was struck last week, which has varied in size from 1 to 4 feet, which gave the following values from samples taken across the face:

No. 1—Lead, 22½%; gold, 68.46 ounces; silver, 268.5 ounces.

No. 2—Lead, 26%; gold, 69 ounces; silver, 231.2 ounces.

No. 3—Lead, 28%; gold, 91.56 ounces; silver, 1473.5 ounces.

SALT LAKE COUNTY.

Bulletin: Tallies of haulers and shippers show the output of Bingham during May was nearly 10,000 tons. Of this over 7000 tons came by wire tram from Highland Boy. The output of May is fully 2000 tons greater than that of any previous month in the history of Bingham.

TOOELE COUNTY.

The Tribune announces the consolidation of the Mercur G. M. & M. Co. and DeLamar's Mercur Mines Co. The name of the company under the reorganization will be the Con. Mercur Gold Mines Co.; capitalization, $5,000,000, in 1,000,000 shares, 200,000 shares to be held in the treasury; the proportion of interest, two-thirds for the DeLamar Co. and one-third for the Mercur Co. Capt. J. R. DeLamar is slated for the presidency and J. Dern for the vice-presidency. The DeLamar Co. puts in the Golden Gate group of twenty-one claims, 143 acres; the Brickyard group, ten claims, 101 acres; the Merritt group, three claims, 59 acres; various other groups, embracing twenty-seven claims, the Dalton property with all appurtenances, and the Golden Gate mill. The Mercur people put in the Mercur group, thirteen claims, 153 acres; the property at Manning, including the Mercur mill, water rights, claims and all appurtenances. The Golden Gate plant consists of a fire-proof mill, built throughout of steel, the leaching room of which is over one-sixth of a mile long. It contains nine straight-lined roasting furnaces 120 feet long by 12 feet wide each. The entire plant is run by electricity, and all the machinery is of the latest design and thoroughly automatic in operation. The mill is considered the largest cyanide plant in the world, of a capacity sufficient to treat 1000 tons daily. The hoisting works is run by electricity. The total surface improvements on DeLamar's Mercur mines have cost about $875,000. There will be seven directors, of which the DeLamar interest will have four and the Mercur interest three.

WASHINGTON COUNTY.

In the Dixie copper mine, 18 miles from St. George, the vein is in limestone, traced for 6000 feet on the surface, crossing a gulch and entering the granite, where it is lost. The present working is 175 feet wide. The tunnel, after passing through 200 feet of limestone, enters the vein. Assays show 8% lead, six ounces silver and 14% copper to the ton.

WASHINGTON.

OKANOGAN COUNTY.

Near the town of Silver, in the Lily mine, is reported a strike of ore at a depth of 185 feet, assaying $10.20 gold.

SNOHOMISH COUNTY.

The Everett arsenic plant, building at the smelter, has 1500 feet brick flues, through which the smoke from the arsenic and sulphur bearing ore in the roaster passes to the 120-foot brick stack.

STEVENS COUNTY.

The Northport smelter capacity is to be doubled.

WYOMING.

W. G. Emerson and associates say they will build a large matte smelter at Grand Encampment, and, as a preliminary, have deposited $100,000 in a Denver bank. The smelter is to handle the product of the Ferris-Haggerty copper mine.

FOREIGN.

BRITISH COLUMBIA.

In the Kamloops country the Iron Mask has been sold to the B. C. Exploration Syndicate.

At the annual meeting of the Payne Con. M. Co. of Slocan the manager said: "At present we are drawing our principal ore supply from the stopes between levels Nos. 3 and 4; stopes over No. 5 have not yet been opened. The ore product for the months of February and March has been lower grade than usual, mainly because it has come from the western part of the ore chute, where the silver values, per unit of lead, are lower than the average. During the coming year I believe the ore will average ninety ounces silver per ton and 15% lead. The production should exceed 1000 tons per month. The ore reserves are fully as large as when you took over the property, and are better opened up."

It was explained that the ore would net $57 per ton, or $57,000 per month, which, less $15,000 for working expenses, leaves $42,000 net profit monthly.

From October, 1896, to June, 1899, the Payne paid dividends to the amount of $1,100,000, created a surplus of over $200,000, and paid the original owners for the property.

The King Solomon M. Co., the property of the Canadian Pacific Co., is in charge of A. D. Wesbey.

At the War Eagle the ore bins destroyed by fire last week are to be built closer to the big hoist, so as to save the tramway connecting the bins with the hoist. They are to be double the capacity of those destroyed. The gravity tramway will be extended 90 feet farther up the hill. There are sixty-five men at work.

The contract system on the War Eagle and Center Star is a success and is being extended.

For the month ending May 15 the cleanup of the twenty stamps at the Cariboo, Camp McKinney, mill amounted to 1446 ounces. The concentrates run on an average about $1500 per month and are shipped to Trail for smelter treatment.

MEXICO.

Torreon men have formed a company to establish a smelter at that point. J. Schram, of the firm of Schiess & Co., is the manager.

J. M. Wilson, former manager Garduno M. Co., Puerto del Oro, Guerrero, on the State line between Guerrero and Michoacan, says that several good copper finds have recently been made in that vicinity. The Garduno Co. has a 16-stamp mill in operation.

THE KLONDIKE.

The first party from Dawson by steamer May 19 say the Klondike cleanup was well under way when they left and would reach $20,000,000. From all the creeks reports were that the cleanup would be 50% greater than last year.

Personal.

GEORGE H. EVANS has returned from Boston to Breckenridge, Colo.

WEST HOLLISTER is now superintendent President mine, Leadville, Colo.

HAMILTON SMITH is in San Francisco. He will return to London about Aug. 1.

CHAS. J. BUTLER is mine superintendent Iron-Silver mines, Leadville, Colo.

J. T. DONAHUE has resigned the superintendency of the Mammoth, Utah, mine.

CHAS. J. MOORE, of Cripple Creek and Leadville, Colo., goes to London and Paris.

A. F. WUENSCH has returned to Leadville, Colo., from a tour through California, Arizona and Mexico.

CHAS. H. MEUSEL, hydraulic engineer for the Horsefly, B. C., M. Co., has returned to Oakland, Cal.

L. F. J. WRINKLE, of Inyo county, Cal., has been chosen professor of mining and civil engineering at the Nevada State University.

OSCAR SZONTAGH, who is succeeded by A. H. Brown, has returned from the De Lamar properties, Shasta county, Cal., to Salt Lake City, Utah.

W. H. HILE, Supt. Last Chance G. M. Co., Weaverville, Cal., is in San Francisco. His company is building a 12-mile ditch and has 100 men at work.

T. A. RICKARD has the position of controlling engineer on the Independence property, Cripple Creek district, Colo. Jno. Stark is mine superintendent.

S. M. HAMILL has been elected president of the Siemens & Halske Electric Co. of America, of Chicago, which was recently acquired by the General Electric Co.

AT the Cariboo mine, Camp McKinney, B. C., J. P. Keane, for the past two years Supt., has resigned. P. Cunningham, former Supt., succeeds him. The former goes to Wardner, Idaho, where he has a contract for running a long tunnel.

Recently Declared Mining Dividends.

Mammoth M. Co., Utah, 5 cents per share, $20,000	June 7
Empire State, Idaho, M. & D. Co., 3%	June 15

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DUPLEX PUMPING ENGINES.—H. Kessler, San Francisco, Cal. No. 650,509. Dated May 29, 1900. This invention relates to improvements in pumping engines of that class known as duplex engines, in which the movement of the piston of one of the engines is utilized to actuate the valve of the other. It consists in a mechanism by which the effect of the steam may be compounded in engines of this class which have no shaft or flywheel, and comprises the combination of high and low pressure cylinders, and steam distribution valves therefor, with means whereby the high pressure valve is controlled by the movement of the low pressure valve and vice versa. Passages connecting the exhaust of the high pressure cylinder with the steam chest of the low pressure cylinder, together with an equalizer controlling the pressure between the high and low pressure steam chests, and steam connections between the equalizer and said chests.

STEEL WATER GATES.—J. Bouse, San Francisco, Cal. No. 650,502. Dated May 29, 1900. This invention relates to improvements in gates of that class which are designed to control the flow of water under pressure or otherwise, and the object of the invention is to provide for an improved and lighter construction, with means for dismounting the parts to reduce the weight for transportation. It consists in forming the upper and lower members of angle or channel iron with means for uniting the meeting edges of the members, and sides formed of sheet metal and riveted to the members. These separable sheet metal sections have openings and flanged tubular extensions whereby the casing may be secured in a line of conducting pipe, an annular valve seat surrounding the opening upon one side, and a valve adapted to close against the seat, a screw shank or stem extending through a stuffing box in the casing having one end connected with the valve and the other passing through a turnable nut whereby the stem is reciprocated to open or close the valve to reduce the friction and make the parts movable as freely as possible under pressure. Roller bearings are fitted between the nut and flanges against which it is turnable, the rollers being retained in position by a ring.

Latest Market Reports.

SAN FRANCISCO, June 7, 1900.

SILVER—Per oz., Troy: London, 27⅝d (standard ounce, 925 fine); New York, bar silver, 60c (1000 fine); San Francisco, 60⅛c; Mexican dollars, 49⅛c.

COPPER.—New York: Lake, 1 to 3 casks, 16.85 cash; carload lots, 16.50; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.35; Casting, 1 to 3 casks, 16.50; carload lots, 16.25. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.00; Salt Lake City, 3.90; St. Louis, $3.95; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7, sheet 8, bar 6c. London, £17=3.70c per lb.

The schedule of prices issued by the American Smelting & Refining Co. is as follows:

Delivered.	Desilverized.	Corroding.
St. Louis	$3 95	$4 05
Chicago	3 95	4 05
Cincinnati	4 00	4 10
Pittsburg	4 05	4 15
Philadelphia	4 05	4 15
New York	4 00	4 15
Boston	4 07½	4 17½

SPELTER. — New York, $4.45; St. Louis, $4.55; San Francisco, ton lots, 6c; 100-lb lots, 6c.

ANTIMONY. — New York, 10c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON. — Pittsburg, pig, No. 2, foundry, $20.00; gray forge, $18.50; San Francisco, bar, per lb., 3c.

STEEL. — Billets, Pittsburg, $28.00; sheet bars, $32; San Francisco, bar, 11c to 18c per lb.

QUICKSILVER. — New York, $51.00; London, £9 10s; San Francisco, local, $49.50 ℔ flask of 76½ lbs. Export rates withdrawn. Dealers predict sudden advance.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

MAGNESIUM.—New York, $3.00 ℔ lb.; San Francisco, $4.00.

ZINC.—San Francisco, 6c; slab, 6½c; bar, 8c.

SOLDER. — Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17c.

SITUATIONS WANTED.

SITUATION WANTED,
By Mine Superintendent.
Long experience. Best of reference. Address F. A. WALTER, 2929 Lafayette St., Denver, Colo.

COMPETENT CYANIDE MAN AND ASSAYER open for engagement. Best of references. Also an experienced AMALGAMATOR. Address "South," care Mining and Scientific Press.

WANTED—POSITION AS SUPERINTENDENT HYDRAULIC MINING PROPERTY. Thoroughly qualified in all its branches. Over twenty years' experience. References. Address "Mining Superintendent," care this office.

Situation Wanted by a Millman.
Twenty-two years' experience in California, Mexico, and Central America. Best of references. Address W. S., this office.

Quicksilver
For Sale in Lots to Suit.
REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

A Large Hydraulic Mining Property For Sale,
Comprising 274 acres and having water rights, ditches, reservoirs, etc. Ground has averaged for thousands of cubic yards of gravel over 22 cents per cubic yard. The property is offered for sale on favorable terms, for the closing of partnership affairs, and in consequence of the death of principal owners. There are no complications; U. S. patents for title. Facilities for restraining dams good; U. S. Debris Commission rights for dams granted. Every facility given for thorough investigation. For further particulars apply to ALMARIN B. PAUL, Agent for Eastern owners, 27 Crocker Building, San Francisco.

ALVIN PHILLIPS & CO.,
Chemists, Mining and Metallurgical Engineers,
1761 MARKET STREET,
DENVER, - COLO.
Complete Ore-Testing Works — capacity ten pounds to two tons. Modern Methods of Lixiviation, Cyanide and Chlorination. Concentration on Bartlett Table. Assaying and Bullion Refining. Chemical Analyses of Oils, Coal, Water, and all solutions. WRITE FOR PRICES.

BENJAMIN T. LLOYD,
STOCKS, BONDS AND MINES.
Have immediate customers for well-developed Gold and Copper Properties.
P. O. Box 608, **SALT LAKE CITY, UTAH.**

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.
A. M. DONALDSON & CO.,
ASSAYERS AND WASTE PRODUCT SMELTERS,
1661 Larimer St., Denver, Colo.
Write for Donaldson's Assayers' Slag Hammer

Mill Plans, Cyanide, Concentration, Smelting, sampling.
F. D. BAKER,
Mechanical Engineer,
420 Boston Building.....DENVER, COLO.

FRED C. MILES,
CISCO, PLACER CO., CAL.
COPPER AND GOLD PROSPECTS.
A GOING GOLD PROPERTY.

WANTED.

Wanted—Diamond Drill Runner.
Wages, $3 60 per day. Address THE MOUNTAIN COPPER COMPANY, LIMITED, Keswick, Shasta Co., Cal.

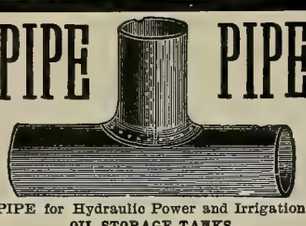
RICH DRIFT MINE
IN PLACER COUNTY.
Wanted, parties with capital to purchase an interest in a large rich gold mine, or to work on percentage. Address H. H., Mining and Scientific Press.

Wanted,
Reliable parties to join other reliable parties in a fine quartz prospect. References exchanged. Address A. F., this office.

WANTED,
A Developed Copper Property.
A specialty made of developed properties in Mexico and the Southwest. Good mines and prospects are wanted. Bona fide correspondence of mine owners, capitalists and investors solicited.
H. E. RUNKLE, Mining Broker, El Paso, Texas.

REFRACTORY ORES WANTED.
1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.
C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

Atlin Gold Fields,
British Columbia. Of particular interest to HYDRAULIC OPERATORS and experienced QUARTZ PROSPECTORS. American miners can pre-empt claims. For further particulars write BROWNLEE & LOWRY, Civil and Hydraulic Engineers and Land Surveyors, Atlin, British Columbia.



M. S. HAUSER,
Room 38, 12 Front St., San Francisco, Cal.
Will act as purchasing agent for mining companies.
Will use the benefit of his wide experience in getting the best articles at the lowest prices, securing low freight rates, and prompt delivery.
Will submit estimates on all kinds of supplies.
Will work for either a small salary or a commission, and show a saving greatly in excess of charges.

THE LITTLE ALASKA GOLD WASHER.
Price $6. Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time*, *labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

PIPE PIPE

PIPE for Hydraulic Power and Irrigation.
OIL STORAGE TANKS.
GENERAL SHEET IRON WORK.
Lacy Manufacturing Co.,
LOS ANGELES.

FOR SALE.

For Sale---One 25 H. P. Hercules Gas Engine.
In first-class order. For particulars, apply by mail to JERRY J. SULLIVAN, Supt. Pioneer Gold Mining Company, Towle, Placer Co., Cal.

Group of Gold and Silver Mines for Sale.
For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery. For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

FOR SALE.
FILTER PRESS.
Johnson, 24-chamber, acid proof, washing Filter Press, 24-in. square plates. Nearly new.
THE S. H. SUPPLY CO.
WRITE FOR CATALOGUE OF MINING MACHINERY AND SUPPLIES.
22nd and Larimer Sts., DENVER, COLO.

Hydraulic Pipe FOR SALE.
1500 feet 11-inch Casing weighing 27 lbs. to the foot, with Flanges, or Screws and Sockets; in lots to suit. Correspondence solicited.
C. J. TALLON,
308 Market Street, San Francisco, Cal.

FOR SALE.
The following Machinery:

150 H. P. Compound Ball Engine, 12-inch and 20-inch Cylinder, 18-inch Stroke, complete with Fly Wheels, Steam Pipes, Shafting, etc.
150 H. P. Heine Boiler.
7 H. P. Gasoline Hoist.
Burleigh Steam Power Duplex Air Compressor, 15-inch Steam Cylinder and 14-inch Air Cylinder, 18-inch Stroke.
Triplex Knowles Pump, operated by Electric Motor, 6¼ inch Plungers, 7-inch Stroke.
8 Electric Motors and Generators, 500 volts, from 10 to 75 H. P.
5000 feet 12-pound T Rails.

For further particulars and prices, apply to
R. W. Smith,
OROVILLE, - - CALIFORNIA.

QUARTZ MILL FOR SALE.

10-Stamp Quartz Mill.
1 Rock Breaker.
2 Ore Feeders.
1 Engine.
2 Water Wheels.
4 Frue Vanners.
6 Canvas Tables.
1 Boiler.
1 Endless Chain.
1 Electrical Plant.
Belts, Pipe, Pulleys and Bolts in profusion.

Mill been used but little. Situated on Dog creek, by wagon road six miles from Delta station, Shasta county, on California & Oregon branch of Southern Pacific Railroad. Will sell at a sacrifice, as owner has no use for it.

Address
C. C. BUSH, Agent,
Redding, = = California.

WHITEWASHING —AND— TREE SPRAYING **PUMPS.**
Prices from $4 to $60. Nozzles from 75 cts. to $1.00. Catalogues WM. WAINWRIGHT, 1411 Jackson St., San Francisco. Telephone Hyde 2986.

WANTED.
A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.
Address: **EDWARD N. BREITUNG,**
MARQUETTE, MICH.

RISDON IRON WORKS,

SAN FRANCISCO, CALIFORNIA.

Cable: "Risdon's." Code: A. B. C. & Leiber's.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build GOLD DREDGES COMPLETE IN RUNNING ORDER to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 30 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

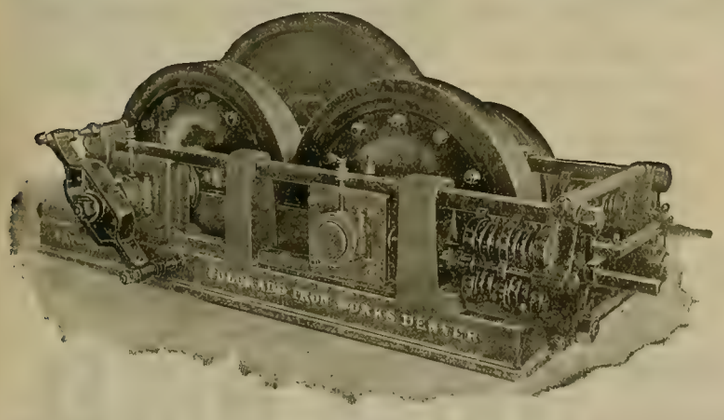
We publish sixteen catalogues. Write for one in the line you are interested in.

RIVETED STEEL WATER PIPE

RISDON IRON WORKS MANUFACTURERS

BEALE & HOWARD STS. SAN FRANCISCO, CAL.

All sizes of Steel Water Pipe for City and Town Supply, Placer, Hydraulic and Quartz Mining. Cut, punched and rolled to be riveted at destination or made up complete.



We make a specialty of all kinds of Heavy Sheet Iron and Steel Work. Plans and Estimates furnished.

THE COLORADO IRON WORKS CO.,

DENVER, COLORADO.

Manufacturers of HIGH CLASS

Ore Milling Equipments.

WE ARE THE ORIGINATORS

—OF THE—

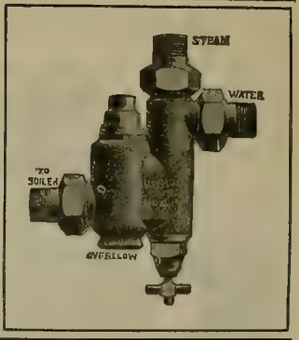
Narrow Face, Large Diameter, High Speed

CRUSHING ROLLS.

FRANCIS SMITH & CO.,

—MANUFACTURERS OF—

SHEET IRON & STEEL PIPE



FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

46 FREMONT STREET, - - - - SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipe with Asphaltum.

THE U.S. INJECTOR

USED BY THE UNITED STATES GOVERNMENT

THE AMERICAN INJECTOR CO.

DETROIT·MICHIGAN

SMOOTH-ON CASTINGS.

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MESSRS. MADISON, BRUCE & SELLERS,

34-36 STEUART ST., SAN FRANCISCO, CAL.....AGENTS FOR PACIFIC COAST.

PUMPS FOR ALL PURPOSES.

THE

Pelton Water Wheel Company

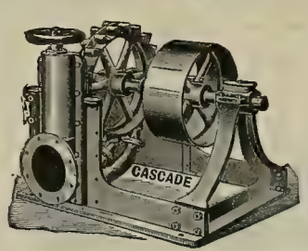
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.



The Pelton Water Wheel Company,

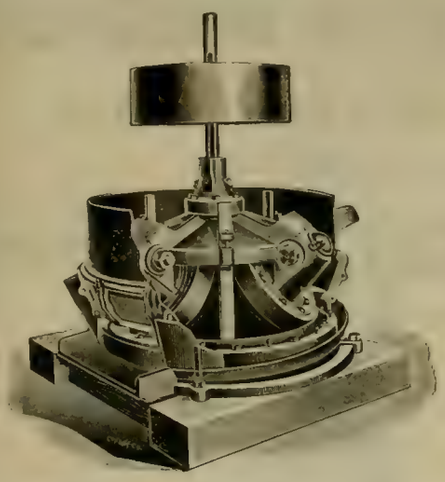
121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.

Our experience of **38 YEARS** building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.



State your Head and requirements. Send for pamphlet.

Dewey, Strong & Co., Patent Agents.

330 Market St., San Francisco, Cal.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

For Laboratory Use and Fine Chemical Work.
PURITY GUARANTEED.
Also COMMERCIAL ACIDS.

A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

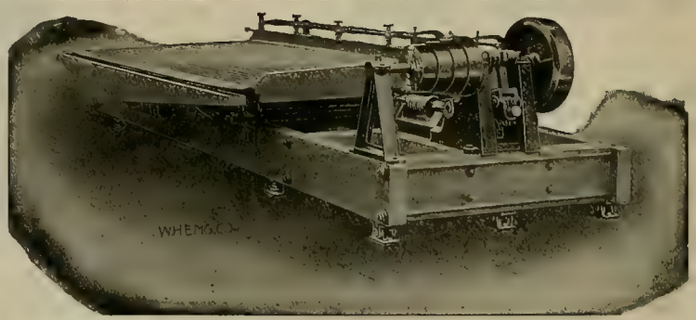
Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.



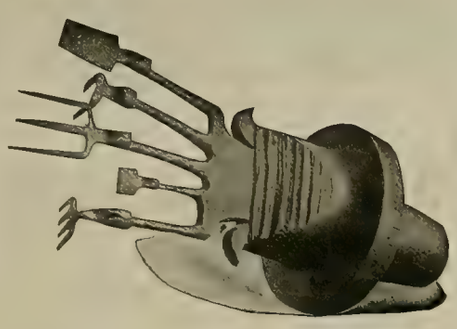
(SEE PAGE 649.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

30th and Blake Streets, - - - - DENVER, COLORADO.

SHOES and DIES of **SUPERIOR** quality and at prices 20 to 30% lower than any other maker. FURNISHED BY ARTHUR KOPPEL, 66 Broad St., N. Y. City. WRITE FOR PARTICULARS.

Contracting Engineers and Millwrights,

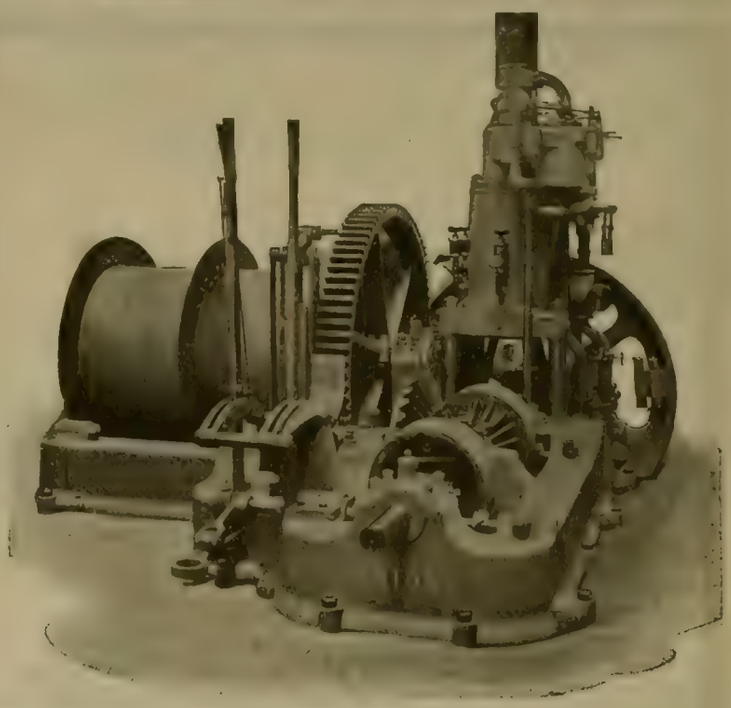
OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.



Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These Machines are Kept in Stock Ready for Immediate Shipment.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

THE WM. HAMILTON MANUFACTURING CO.,

LIMITED,

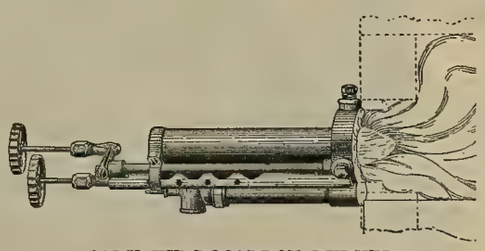
MINING MACHINERY,

PETERBOROUGH, ONTARIO,

CANADA.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.



Price of Improved Bone Ash, $60.00 per ton; $3 50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

CUMMINGS & SWEARS, Sole Mfrs.,

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

GATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

A Money Maker in Nicaragua.

MURRA GOLD MINING COMPANY, NICARAGUA, C. A.
NICARAGUA, June 20, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

After an experience covering a period of three years with both the first and improved "Tremain Steam Stamp Mill," in every particular I have found it perfection—a money maker, and just the thing for a small capital, while companies organized on a large scale would do well to look into its merits.

I find no difficulty in crushing eight tons of ore per day and running on hard ore. This mill should be a winner.

Very truly yours,

[SIGNED] L. W. ADAMS,
General Manager Murra Gold Mining Co.

Eight Years in Operation Without a Cent for Repairs.

GOLDEN P. O., JOSEPHINE CO., COLO., December 23, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

Our Tremain Mill is giving us good results, and although being in operation since 1892 has not cost us $1 for repairs, and to-day is making 180 drops per minute with 95 lbs. steam pressure.

The ore we are working at present is soft and we mill in 24 hours, using No. 10 slot screen, 15 tons.

Yours truly,

M. C. DAVIS,
Superintendent Sarah Belle Mines.

Running Under Compressed Air in West Australia.

293 ST. GEORGE'S TERRACE, PERTH, W. A., February 6, 1900.

F. R. PERROT, ESQ., AGENT OF GATES IRON WORKS, PERTH, WEST AUSTRALIA.

DEAR SIR: In reply to your enquiry as to the working of the Tremain Mill on the Burbanks Grand Junction, I would state that at the start we worked this from the boiler supplied by the Gates Iron Works Company, but owing to certain irregularities of the running, which were in a measure due to the intermittent supply of ore and the short time that we were able to run it per day, I finally laid on air piping from my air compressor, a quarter of a mile distant, and used the boiler as an air receiver, with the result that I got an absolutely constant run, which, I believe, averaged about 105 drops per minute, and this was kept up with great regularity and showed a much better return in the treatment of the ore. The usual air pressure in this case was 85 lbs., whereas under steam we were not so satisfied with the result as worked at 100 lbs. By this we were also saved in cost the charges of stoker, fuel and water, and it was worked with much greater cleanliness, and during the whole time the mill was running—which was several months—it never froze up on us or showed any signs of trouble in that direction.

The mill is now temporarily stopped, but when it is again started I shall most decidedly continue the use of compressed air.

Yours faithfully,

[SIGNED] GEO. HEWER.

And in accordance with law, and an order from the Board of Directors, made on the 2nd day of April, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 217 Sacramento street, San Francisco, California, on MONDAY, the 28th day of May, 1900, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

POSTPONEMENT.

The day of sale of the above delinquent stock has been postponed to WEDNESDAY, June 27th, 1900, at the same hour and place. By order of the Board of Directors. CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

—EASTERN PRICES BEATEN.—

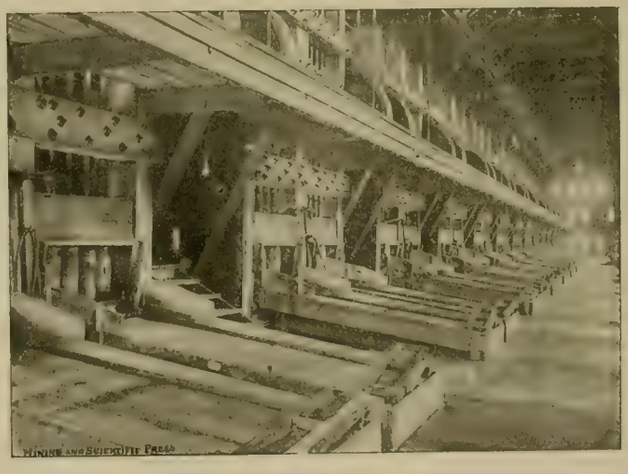
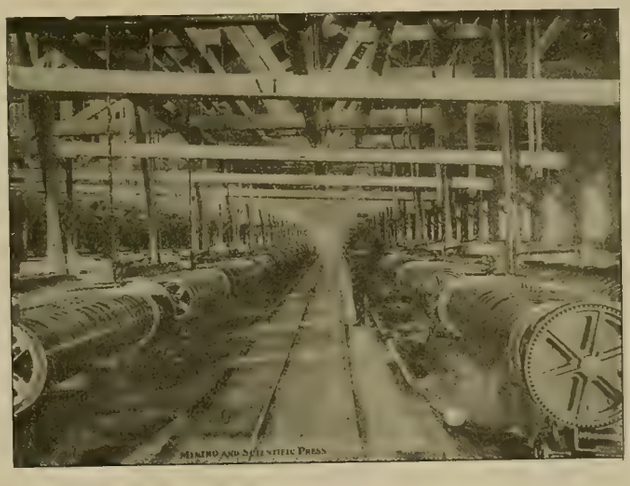
Affinity and What It Signifies.



Affinity or chemical attraction is the force which causes the particles of dissimilar kinds of matter to combine so as to form new matter. This definition indicates the differences between affinity and cohesion, which is another modification of molecular attraction. Cohesion merely binds similar particles into a mass; affinity brings about the combination of heterogeneous particles and causes them to lose their individual properties. The change of characters which follows the action of affinity is noticeable. For example, the inflammable metal sodium unites with the suffocating gas chlorine, and the compound thus produced is chloride of sodium, or common salt, a substance which does not bear the slightest resemblance to either of its components. Chemical combinations do not take place indifferently, but in accordance with certain strict rules or laws. One substance will unite with another in preference to a third, or in some cases in preference to any other. This preference is denoted by the term elective affinity. By means of this discriminating action of affinity some combinations may be decomposed. If, for instance, there be a substance (x) composed of two elementary bodies (a and b) which have a slighter affinity for each other than one of them (a) has for a third element (c), then if we bring this third body into connection with them under the requisite conditions, the one (a) which has the greatest affinity for it will leave the other (b) and unite with it to form another compound (y). The decomposition of water by redhot iron illustrates such a case; for if water, which is composed of the elements oxygen and hydrogen, be passed through a tube containing iron filings heated to redness, its oxygen will unite with the iron to form a kind of rust, and its hydrogen will be set free. In every case where one constituent is expelled by a new body, and thus liberated, the decomposition is said to be the result of single elective affinity; but when two substances, each consisting of two constituents, act reciprocally upon each other so as to produce two new compounds, the decomposition is referred to double elective affinity. This double reaction takes place when chloride of phosphorus is thrown into water. The chlorine leaves the phosphorus and unites with the hydrogen of the water to form hydrochloric acid, while the remaining elements, phosphorus and oxygen, enter into combination and produce phosphoric acid. An idea formerly prevailed that the affinity between any two substances never varied, and great labor was bestowed on the preparation of tables exhibiting the precedence of affinities. Modern chemists, however, do not regard affinity as a fixed and regular force, and the tables alluded to are now considered of no use. The attraction of one body for another is greatly modified by the circumstances under which the two bodies are brought together. Alteration of temperature is one of the causes which influence the force of chemical attraction. When metallic mercury is heated nearly to its boiling point, and exposed in this condition to the air for a lengthened period, it absorbs oxygen and becomes converted into a dark-red crystalline powder. But the same oxide of mercury, when raised to a still higher temperature, parts with its oxygen, which leaves the mercury in its original metallic state. Insolubility and the power of vaporization are potent disturbing influences. They interfere in almost every reaction and frequently turn the scale when the opposing affinities are nicely balanced. Thus when a solution of lime in hydrochloric acid is mixed with a solution of carbonate of ammonia, a double reaction ensues; carbonate of lime and chloride of ammonium being generated. This result is brought about mainly by the insolubility of the carbonate of lime. Again, a mixture of dry carbonate of lime and chloride of ammonium, when heated in a retort, gives a sublimate of carbonate of ammonia, while chloride of lime remains behind. In this instance the great volatility of the new ammoniacal salt determines the nature of the decomposition.

What is called the nascent state is one very favorable to chemical combination. Thus, carbon and nitrogen refuse to combine with hydrogen under ordinary circumstances; but when these gases are nascent or newly evolved, as when they are simultaneously liberated from some previous combination, they unite readily. Some remarkable decompositions are referred to a peculiar modification of chemical force, to which the term disposing affinity has been applied. The preparation of hydrogen from zinc affords a familiar example of such decompositions. A piece of polished zinc put into pure water remains perfectly bright for any length of time and manifests no power of decomposing the liquid. On the addition, however, of a little sulphuric acid the metal becomes oxidized and hydrogen is freely disengaged. The acid dissolves the oxide as fast as it is produced, and thus keeps the surface of the metal exposed to the action of the water. This function of the acid is perfectly intelligible; but its decomposing influence, under which the oxide is first formed, is not entirely understood.



Affinity is generally much stronger between bodies which are very unlike each other than between bodies which are closely allied. Thus, potassium and sodium tend strongly to unite with chlorine and iodine, but the bodies of each pair do not attract one another with sufficient force to enter into combination. The discoveries of Faraday and others have established the fact that whenever two substances unite to form a compound, they are in opposite electrical conditions, one being electronegative, the other electropositive. This and other facts go to prove that chemical affinity is a particular modification of electrical attraction.

THE Cape Nome hegira has taken machinists as well as miners. Cripple Creek, Colo., reports difficulty in securing machinists, and the same story comes from Calaveras and other California counties.

A NOTED phase of scientific progress is observable in the commercial changes in the great enterprises that have so served to annihilate time and distance. The business of the Western Union Telegraph Co. has been so cut into and absorbed by the long-distance telephone service, that the former concern has appropriated $20,000,000 to engage in the telephone business on a large scale, and thus recoup some of its recent loss of old time profits. The device that twenty-five years ago was dubbed "a toy," has now over one thousand million dollars invested in its development, and has revolutionized the system of national communication.

AS SHOWN ELSEWHERE, Utah lead producers are organizing to sustain the price of that product. One way proposed there is to ship away the surplus lead. If statistics are trustworthy, the United States' annual lead consumption is 6000 tons more than its production. If imported lead makes such a slump in the market as the recent one, it looks like "seething the kid in its mother's milk" to expect the ore producers to go to the expense of sending it out of the country. Some Utah ore producers are holding their higher grade lead ore in expectation of a rise, which would seem to be more in accord with the law of supply and demand.

AS IN other departments, the tendency in mining appliances is steadily toward automatic working—the replacement of human labor by mechanical devices. The idea is to use a machine for anything that can be done without thinking, and so set men free to work the best part of them—the brain—and to get a higher price for their work thereby. This idea and this inevitable tendency is opposed by many men, who look upon a machine as a rival, and view an automatic device as something calculated to make them "lose their job;" but a broader view of the matter shows that every automatic appliance enabling the American worker to emancipate himself from drudgery done better by a machine, gives him a better chance to develop into a better wage earner.

Head Gear for Mines.

On page 674 is some reference in our special Colorado correspondence to a gallows-frame over the Wolfe Tone shaft at Leadville. A picture of the frame or head gear is given on page 669. On the same page appear pictures of other typical head gear for shaft hoists in different localities. The subject is of practical interest.

It will be noted in the description on page 674 of the Leadville head gear that it is built of redwood, is 82 feet high, and the main timbers are not mortised, being held together by heavy iron bolts. In striking contrast is the head frame of the High Ore mine at Butte, Montana, built of steel, which is superseding timber for such purpose, not rapidly, for miners are conservative and respect tradition and ancient usage; but economy, safety and due regard for engineering requirements militate in favor of the progress of the use of steel in mining operations and the gradual disuse of timber.

Montana mines are replacing wooden frames of massive 24x36-inch timber with such steel head gear structures as that illustrated. The height of that frame is 100 feet to the center of the sheaves; the base is 38x65 feet. The weight of each of the frames complete is 310,000 pounds, which does not include the cast-iron bases or the anchor bolts. In these bases is provided a vertical adjustment by which the alignment of the frame can be preserved in case the ground should settle. The Anaconda Co. state that the head gear mentioned, and illustrated on page 669, is satisfactory in its operation.

Were a picture procurable of some of the simple hoisting equipments of years ago at Leadville they would contrast strangely with the frame illustrated and referred to, now building in the same locality, at the Wolfe Tone mine. On Fryer hill, Leadville, in earlier days, good ore producers were rigged out with simply equipped hoisting works, consisting, so far as the frame was concerned, of a tripod, three poles lashed together, tied at the top, and a sheave wheel at the point of joining. Of course, as depth was attained, those primitive devices disappeared, giving way to more elaborate modern mechanism, made necessary by deep mining.

The engraving of the gallows-frame at the Malvina-Potosi shaft of the Merced Gold Mining Co., near Coulterville, Cal., represents a common type of wooden head frame in Montana, less frequent in California. (The Merced Co. is a Montana organization.) This type of gallows-frame, while not up to the most approved modern idea, is simple and easy to frame and erect. It usually gives satisfaction where prospecting, and later where cages or even self-dumping skips are run. Some miners consider this style of frame to be superior to the four-post frame over vertical shafts, so commonly found in California, for the reason that, ordinarily, the four-post frame has two useless members, being therefore unnecessarily expensive and cumbersome. If the angle brace be set a little to the rear of the line of greatest strain, a line dividing the angle midway between the reel of the hoist and the cable in the shaft would give the desired result. As this is the main compression member, the upright posts need not be as strong as they are usually made; but a factor for safety generally costs but little more than a structure built strictly on theoretical lines, and therefore the miner is willing to pay the slightly greater cost and be on the safe side. The old-time four-post frame still has the call in California, and the traveler through the State will find them building in almost every district. The only innovation in the four-post frame coming to our notice recently is that at the Fremont shaft, near Amador City, Amador Co., Cal., where a frame of 12-inch timbers has been built, minus angle braces—something new.

The illustration of the two-post gallows-frame at Cripple Creek, Colorado, typifies the style of head gear in use there, the side braces attached to give it greater rigidity and the iron rods tieing it to prevent side swaying.

Coming back to California frames, the one depicted as in use at the Oneida mine, Amador Co., deserves commendation, as also the one at Pennsylvania hill, Grass Valley. The Oneida gear is not cumbered with any superfluous material and is jointed with intent to distribute and equalize the strain inevitable on head frames over a shaft in which heavy loads are rapidly hoisted from a considerable depth.

In this, as in all mine methods, there are varying requirements that must be met. The incline, the vertical shaft, the three-compartment affair over productive mines, the more modest needs of the mine that has gone from windlass and bucket to whim, and so to head gear for greater depth, all have their special requirements, and the doctrine of expediency prevails. Yet there are certain general features of construction and evolutionary ideas that take into account safety and economy. It makes little difference how a headgear is constructed if it satisfactorily fills local needs, and it is necessary to pay less attention to symmetry or appearance than to strain. The main compression members need to be placed in the line of the resultant of the strains on the rope, with due regard to the power and direction of the force applied.

THE world owes a debt to pure science that is not always recognized. The supreme test of anything in the commercial world is, "Will it pay?" and, with that result as the criterion, science certainly does "pay." Advance in all practical work is uniformly based on established scientific data. The lack of such accurate data often determines the difference between success and failure. Recently, in southern California, a firm contracting for the construction of a breakwater at San Pedro lost money, and ultimately had to give up the contract for lack of a little scientific knowledge of the rock in that locality. Because of acting in ignorance or defiance of scientific rules, the builders of a dam at Austin, Texas, occasioned the loss of a million dollars. When scornful question is made as to the use of all this science, it may well be asked what in mining, metallurgy or engineering could to-day be successfully done by the old rule of thumb.

FROM the Dewey mine, at Stuart, near Lewiston, Idaho, is reported ore as a "gold sulphide." All the metals without exception combine with sulphur in more than one proportion; what is true of the metals in relation to sulphur is equally true as regards chlorine, bromine and iodine. Sulphides, chlorides and bromides of the different metals are not uncommon. It has been considered, however, by some metallurgists that, though gold is sometimes found in the sulphides of the metals, doubt arises as to its having been present in chemical combination with the other constituents of the ores, the inference being that its presence is more mechanical than chemical. While the free gold found in many places has manifestly resulted from the oxidization of iron pyrites, the process of separation seems rather to have been due to the unclothing of the particles of imbedded gold.

TO THE scattered mine employes of the Transvaal telegrams from mine owners have been flying since the recent British advance, calling them from all parts of the earth to renewed duty at Johannesburg, where it is expected will be active resumption of work. The good salaries proffered induce acceptance. H. C. Behr, who left California last week, is credited with a proffer of $15,000 per annum and expenses. Allen Kinkead, foreman of the Best & Belcher and Gould & Curry, of Virginia City, Nevada, is locally credited with receipt of a cablegram requesting him to report at the earliest date possible at Johannesburg, at a salary of $6000 per annum. It is the publication of such announcements as these that so stimulate attendance at the mining schools, and make ambitious young men desirous of taking up the study of mining.

"AMERICAN INVESTMENTS," published at Buffalo, N. Y., claims to have figured it all out, and declares that "80% of the estates in this country either partially or wholly sink out of view because of waste, defalcations and wildcat speculations of trustees," and that "60% of all the life insurance money that comes to beneficiaries is wasted and fails to accomplish the purposes for which it was originally intended." If these statements are correct, it is in order for some statistician to show by comparison how much safer mining investments are, and how greatly larger a percentage of the money invested in mining results in satisfactory profit than in the risk and recklessness of the lines cited.

Concentrates.

TRINIDAD LAKE ASPHALT contains 4.33 parts sulphur; California, 7.51.

THE ordinary alloy used in casting in bronze is 90% copper, 8% tin, 2% zinc.

THE barometric reading on the summit of Mt. Everest—29,000 feet—is 9¼ inches.

FREIGHT on shoes and dies from San Francisco to Colorado points is $1.55 per 100 pounds.

IT will take twenty-nine pounds water at 180° F. to condense one pound of steam at 213° F.

A PRIMARY COLOR is a hue which is incapable of being produced by the mixture of any other two hues.

NITRATE OF GOLD is a doubtful quantity; at best an unstable compound immediately reducible to oxide of gold or metallic gold.

THE manager of the Canadian Copper Co., Cleveland, Ohio, can furnish the desired information as to electrolytic refining of nickel.

THE subject of the treatment of slimes was treated technically at length in the issues of July 22, 1899, July 1, 1899, and October 15, 1898.

ONE HUNDRED AND TWENTY-ONE stakes can be driven into a space 15 feet square, no two stakes to be nearer together than 18 inches.

A TON of Atlantic ocean water evaporated yields 81 lbs. salt; a ton of Pacific water, 79 lbs.; a ton of water from the Great Salt Lake, Utah, 175 lbs.

DILUTE SULPHURIC ACID, or aqua regia—one part nitric and three parts hydrochloric acid—will etch on steel. The steel surface should be clean and free from grease.

TO LIGHT fifteen 16-candle power incandescent lamps would require twenty-eight cells of seven plates, each 7¾x7¾ inches. These will discharge eight hours at the rate of 15 amperes.

THERE is a scale of hardness, but no "unit" of hardness. The scale would run downward as follows: Diamond, sapphire, topaz, quartz, orthoclase, apatite, fluorspar, calcite, gypsum, talc.

NOTIFICATION is received that the Congress of Miners at Paris, France, will be in session the 19th–23rd inst., instead of the 23rd–27th prox., as originally announced by the Exposition authorities.

IN California kaolin is found in various parts, notably in San Diego county. It is used by makers of pottery in Ohio and New Jersey, and is worth from $5 to $15 per ton, according to quality and condition.

THE "standard candle" is a candle made of spermaceti, and burning 120 grains of spermaceti per hour; it serves as the standard of gaslight, the gas burning from a jet at the rate of 5 cubic feet per hour.

TO DRILL a hole in a piece of hardened steel, use a new drill; sharpen it; then heat it to a low red and plunge it into a solution of zinc chloride; if the drill requires sharpening, always reharden after sharpening.

FINE nickel is produced electrolytically at Newark, N. J., in plates ⅝-inch thick; the Canadian Copper Co. have also erected a large experimental electrolytic plant at Cleveland, O., for the treatment of Bessemer nickel matte.

TO FIND THE AREA of a section of a ditch with sloping sides, add together the width at top and bottom in inches; multiply the sum by the depth in inches; divide the product by 2; the quotient divided by 144 is the area in square feet.

MOLYBDENUM will color a blowpipe flame a yellowish green. Its compounds before the blowpipe on charcoal yield a coating which is yellowish while hot and white when cold. The white coating takes on an azure tint when touched with an intermittent reducing flame.

WITH two boilers 48x24 inches, with twelve 6-inch flues each, if a single feed-pump be required, one having a steam cylinder 4½ inches, water cylinder 2¾ inches, and a 6-inch stroke, would do. For a duplex pump the steam cylinder should be 4½ inches, the water cylinder 2¾ inches, and the stroke 4 inches.

AT Butte, Montana, and in the Cœur d'Alenes, Idaho, miners' hours are ten; wages $3.50 per day. The Butte Miners' Union has made a demand on the mining companies of the district for a reduction in the hours of labor from ten to eight, which has been conceded by Clark and Heinze, beginning with the 15th inst.

AMONG the advantages of liquid fuel are that it can be run into bunkers or tanks by gravity, thus dispensing with tedious and costly loading by hand; it can be automatically brought to and into the furnaces, with similar economy in labor; it produces no ashes. A ton of oil contains twice as much heating power as a ton of coal.

IT would be possible to use pure aluminum for many of the parts of a 1 H. P. gasoline engine. An alloy of 90 parts aluminum, 9 parts silver, 1 part copper—by weight—would make a hard, serviceable, light metal, suitable for cylinder, piston and valves. The cylinder could be covered with a thin sheet-metal water jacket, and make a light and handsome engine.

A WELL-CONSTRUCTED asphalt pavement should last fifteen years. There is a piece of pavement on Front street, San Francisco, under the old MINING AND SCIENTIFIC PRESS office, upon which has been heavy and constant traffic for twelve years, and it is yet in excellent condition. Rectangular granite blocks laid on a formation of hydraulic cement concrete make the most durable street pavement, but the noise wears out the nervous dwellers, and, where human life is counted, the noiseless asphalt is much cheaper.

TELEGRAPH WIRES always run over a tunnel, instead of through it, because if they passed through they would require special wall brackets or overhead supports, involving considerable cost; the vibration of passing trains would tend to loosen the wire fastenings; the smoke, steam, carbon, acids and water deposits would tend to deteriorate the service.

AN electric motor may be reversed by putting a pole-changing switch in the armature circuit. If both circuits are reversed, the direction of rotation is the same as before. If the brushes are of copper, bearing flat on the circumference of the commutator, they must be reversed; if they bear endwise directly toward the center of the axle, they will not need changing.

ANIMAL OIL has no place around a gas engine. The best mineral oil gives best results. If the exhaust valve sticks and does not close, the valve should be reground and the valve stem cleaned. Irregular pressure of gas makes irregular motion. A larger gas-bag may obviate this difficulty. A gas engine won't stand overloading any better than any other power device.

IRON is the only substance of which the core of an armature can be made, since it alone can allow the magnetic lines to flow through it with sufficient ease. The shaft may be made of aluminum, for there strength is the only consideration, though aluminum is not good material for wear. To temper steel for a magnet, heat the ends of the steel to a red heat, and plunge it endwise into cold water.

THE base of all hydraulic mortars is lime, or oxide of metal calcium. Quicklime contains 44 parts by weight of carbon dioxide and 56 parts oxide of calcium. In slaking, 18 parts by weight of water unite with 56 parts quicklime, making 74 parts calcic hydrate. The process of slaking is greatly facilitated by the heat that is generated. Hydraulic lime contains 10% to 25% alumina. It differs from quicklime in that it hardens in water. It is either argillaceous or siliceous.

THE Federal Government has nothing more to do with title to mining lands after it gives a U. S. patent. The title vests in the patentee, absolutely, to the extent of the property granted. When the patentee gets his deed from the Government the land it describes becomes his private property. That property then becomes subject to the same rules of State law as any other real property within any State. (This answers the question of "Mountaineer," Ogden, Utah.; "S. S. G.," Boise, Idaho; "D. R. T.," Deer Lodge, Mont., and "F. G. C.," Shasta, Cal.)

THE MacArthur process of white lead manufacture consists in boiling a solution of soda tartrate or potash, or a mixture of these—a solution of Rochelle salt—in which lead oxide is dissolved; the solution after filtration is treated with carbonic acid while the solution is still boiling. The best result is obtained by the use of a quantity of ammonia slightly in excess of the chemical equivalent of the lead dissolved. When ammonia is present the temperature of the liquid need not approach boiling point, satisfactory precipitation being obtained with a temperature of 180° F.

THE principal engineering value of electricity lies in its adaptation to the transmission of power from some locality where power is cheap to others where it is dear. A steel rope, by its bodily motion, can transmit with appreciable friction and depreciation some hundreds of killowatts to a distance of some thousands of feet. A bare quiescent copper rope, ½-inch in diameter, and supported on poles, can, by maintaining an effective potential of 10,000 volts by the motion of electric waves over its surface, transmit 2500 killowatts with an energy loss of ⅔% per mile, and with practically no depreciation, except that of the poles and supports.

WATER with an 8-foot fall flowing 30 cubic feet per minute would, theoretically, give $\frac{5}{11}$ H. P., practically, about 80% of that, or $\frac{4}{11}$ H. P. Knowing the pressure in pounds per square foot—styled P—and the volume displaced in cubic feet per minute—styled V—the theoretical horse power may always be found by the formula H. P.$=\frac{P \times V}{33000}$. In the case specified P=62.5×8=500 lbs. per square foot, so H$=\frac{500 \times 30}{33000}$, or $\frac{15000}{33000}$, or $\frac{5}{11}$ H. P. The actual horse power would depend upon the efficiency of the motor.

A GOOD automatic, non-condensing engine requires from 3 to 4 lbs. of coal per horse power per hour, according to the quality of the coal. An automatic condensing engine requires from 2¼ to 3½ lbs. per horse power per hour. A steam-jacketed compound condensing engine of the most improved construction may reduce the consumption of coal as low as 1¾ to 2 lbs. per horse power per hour. The average amount of feed water required for a good, economical engine is 30 lbs. per indicated horse power per hour; engines of high economy will use less than this amount, and those more wasteful will use more. A high piston speed, together with a high rotative speed, is desirable; great power may thus be obtained from moderate sized engines. A good condenser increases the economical efficiency of an engine from 25 to 40 per centum, and the amount of injection water required is about twenty-five times the quantity fed into the boilers.

THE most serious form of corrosion in boilers is that which attacks the plates along the water level, forming a continuous line of weakness. This is due to the acids in the feed water, and can only be remedied by improving the supply. External grooving is often due to leaky calking, and is often caused by the use of a split calking tool having broken the skin of the metal. Buckled sheets usually result from neglect in keeping the boiler clean. Soft deposits are permitted to accumulate over the fire and become hard, allowing the plates to become overheated and to be pushed down with the pressure. In iron boilers this has been attended by ruptures, while in steel boilers the buckled part grooves thinner at its lowest point until a small hole causes a leak.

TO PREPARE proof silver, take any fine silver as free from gold as possible, dissolve in nitric acid, dilute copiously with distilled water, allow to stand several days, that any trace of gold present may settle, decant this solution carefully and filter. Then precipitate the silver with muriatic acid, stirring rapidly as the precipitation is taking place, so that the silver chloride may be well broken up. Then wash with distilled water, after which place a piece of commercial aluminum in the silver chloride and add a small amount of muriatic acid, which soon becomes converted into metallic silver. The silver is then washed; then add muriatic acid and heat to dissolve any aluminum contained. After washing thoroughly to remove all acid and aluminum chloride, dry and melt the silver, which will be 1000 fine.

IN the case of a running stream of water 6 feet deep, 8 feet wide and a surface velocity of 5 feet per second, the horse power—theoretical—can be determined as follows: The surface velocity being 5 feet, the average velocity is ⅘ of that, or 4 feet per second; then the head—theoretical—is 4 squared multiplied by .0155, or .248 foot. Then, multiplying together the number of cubic feet of water per minute, the vertical height in feet, and the weight of 1 cubic foot of water, the horse power is the quotient of the product divided by 33,000, thus: $\frac{(6 \times 8 \times 4 \times 60 \text{ (seconds)}) \times .248 \times 62.5}{33{,}000} = 5.41$ H. P. This, it must be understood, is the theoretical horse power. Upon the kind of motor depends how much of it can be utilized.

THE subway waters near the sea flow into it and are influenced by the rise and fall of the tide, in the same manner that sluggish rivers rise and fall with the tide, although their waters may constantly flow seaward. The rise in the tide increases the underground resistance to the constant flow of water toward the ocean. The waters of artesian wells near the sea have their natural outlet at various distances from the shore, according to the depth and formation of the water-bearing strata. Variations of pressure by tidal action over the outlets of such subterraneous waterways will react upon artesian well flow for a considerable distance from the ocean. Ordinary surface wells near the ocean are influenced by the same causes, and are found to vary their water level with the rise and fall of the tides.

NO FIXED rule can be given for mill practice, supply of quicksilver, etc., as such things are largely determined by the character of the ore. As to the grade from the battery of the copper or silver plates leading to the concentrator, it may be: For the full width plates, 1¾-inch fall to the foot; 16-inch width plates, 1$\frac{5}{8}$-inch fall to the foot; 4-inch sluice boxes, ¾-inch fall to the foot; single row of machines, 7 feet, total fall from mortar lip; double row of machines, 9 feet, total fall from mortar lip; the floor on which concentrators stand to be 7 feet below lip of mortar for single row of machines; but, if crowded for fall, the concentration box can be sunk or lowered 18 inches. If, however, the two usual rows of concentrators be used, the floor to be 9 feet below lip of mortar, to bring sluices above attendant's head when standing between the two rows.

STEEL BARRELS are made in London, Eng. The difficulty of giving the steel sheet the ordinary barrel shape is overcome by easing the curved rolls at the ends, so that they bear only in the middle, thus stretching the metal at the center and forming the barrel body complete, with the exception of shearing the ends straight in a special machine and welding the seam. The welding is done by electrically melting pieces of steel over the opening and hammering them down; the heads are cut in a circular shearing machine, corrugated and dished in a 400-ton hydraulic press, and secured in place by a ring of metal which is welded both to the end of the barrel and the head; the bung bosses are also welded on—no skilled labor being required for the process, and but moderate power is needed to supply the current.

FROM a water wheel of 500 H. P. capacity running a dynamo, the dynamo to operate motor 3 miles away, about 375 H. P. can be secured if modern machines are used and line properly constructed. Using the three-phase system for transmission, with a loss of 5% in the line, one would require three wires each number 0 0 0 0 B. & S. Particular conditions may slightly change the size of a wire. Generate the current at a potential of 1000 volts two-phase, step-up to 3000 volts by means of transformers and transmit by three-phase to save copper. If energy is to be used for both light and power, it can be transformed at the receiving end to 120 volts two-phase. This gives the advantage of the three-phase for transmission and that of the two-phase for generating and distribution; alternating.

The Evolution of the 300-Stamp Mill on Douglas Island, Alaska.*

Written for the MINING AND SCIENTIFIC PRESS by HENRY WATSON.

In this far-away corner of God's earth we read in technical journals of the great strides made in the industrial and mechanical centers of the busy world, of the building of huge steamships, giant locomotives, immense steel rolling mills and vast plants for the generating of electric light and power. Still, in one important branch of the mining industry we are in the van—as in the aggregation of 300 stamps under one roof, for the saving of gold by the amalgamating process, we lead the world.

Besides the big 300-stamp mill, there are four more stamp mills, all of them massed a mile along the easterly shore of Douglas Island, belonging to three corporations, all five under one general manager, built just above tidewater, crushing quartz from the mass of ore mainly of feldspathic nature, slightly impregnated with gold, which lies near, dips under the bay and runs parallel with the shore. The ore will average less than $3 per ton; yet it is worked from each claim at a profit.

Of the several factors which enter into the successful extraction and milling of such low-grade ore, nature has supplied three, viz: location, tide water and excessive rainfall; man has supplied capital, engineering and mechanical skill. The steady and gradual development of the latter factor on the milling question on the island is immense, as there are now 880 stamps on the lode. The first mill built on the Treadwell was five stamps. This was superseded by one of 120 stamps; another 120 stamps was added to it, and last year the 300-stamp mill was finished; so that at the present time the Treadwell has 540 stamps dropping on ore. The experience of the company with 240 stamps under one roof was of great value to them when deciding to build another large mill, that would give the greatest crushing capacity with the least increase of labor to run it.

To show the economy in labor in the simplest form, a table with the number of stamps and employes in the different mills on the lode is given:

Mill.	Stamps.	Employes.
1	100	11
1	120	11
1	120	11
1	240	22
1	300	23

The 100-stamp mill has the same number of employes as either of the 120-stamp mills; the 240-stamp mill, under one roof, has the same number of employes as the two 120-stamp mills, whereas the 300-stamp mill has only one more employe than the 240-stamp mill.

The crew in the 300-stamp mill is as follows: One foreman, four amalgamators, eight feeders, two oilers, one concentrator repairer, four concentrator men, two sulphuret pullers, one man handling kicker; total, twenty-three men. The crew is divided into two shifts, the requisite number for the day being thirteen and for the night ten.

The engraving of the 300-stamp mill shows two buildings, side by side, but 10 feet apart. The upper one is the battery room; the floor space is 72x300 feet; the batteries stand in two tiers and have a solid foundation on bedrock of cement and iron. The block of iron weighs seven tons; four anchor rods, 2 inches in diameter, secured in the bedrock, pass up through the cement, iron and battery mortars; the bolts are tightened from time to time, till the whole mass works solid. A layer of rubber ½-inch thick is placed between the iron and battery mortars to lessen the jar on the cement. The mill is driven by water power, about 700 inches being used. With a fall of 560 feet a pressure of 225 pounds to the square inch is secured. There is a main shaft for each tier of batteries. A Pelton wheel, 17 feet in diameter, is attached to each shaft, driving them direct, and the power is transmitted by two pulleys and belting to the cam shafts. There is a cam shaft for every battery of five stamps.

The mine hoists, with rock breakers on top floor, are distant from the mill about 1800 feet. A locomotive with six cars attached, of a capacity of two tons each, hauls the ore. The cars enter the upper building just under the comb of the roof; they are furnished with a false bottom, and, by a turn of a crank, are emptied into the ore bin, which has a capacity of 3000 tons. Sixty self-feeders supply the batteries with ore. A stamp weighs 1080 pounds and drops 101 times a minute with a fall of 7 to 9 inches; the stamps drop in the battery in the rotation of 1, 5, 2, 4, 3. An amalgamator is in charge of each tier of 150 stamps, with two feeders as assistants. The tiers are named respectively A and B, with each battery numbered from 1 to 30. A record of the time of all stoppages must be kept, with number of battery and cause.

The amount of water supplied to the batteries is very liberal and is regulated a good deal by the concentrating machines, which are liable to be flooded if the pulp from the batteries gets over a certain amount and causes a loss of concentrates. Screens of 30 and 35 mesh are used and a copper plate is placed inside each battery. The apron plate is 4 feet 6 inches by 10 feet, with a grade of 2 inches to the foot. The plates are coated with a solution of quicksilver and kept clean with a solution of cyanide, and the amalgamators aim to keep the plates hard. The amalgam is cleaned off the plates only once a month—always on the day shift—five batteries per day, so that it takes twelve days every month to clean up.

When cleaning up, the apron plate is steamed, and, while the amalgam is soft and plastic, the plates are scraped with sharp chisels; meanwhile the battery plate and pulp around the dies are put on a car and run into the cleaning room, which is situated in the center of the concentrating building, up under the roof. This arrangement brings the cleaning room floor just on a level with the battery floor. The machinery and furnishings of the cleaning room are up-to-date and labor-saving, consisting of revolving barrel, amalgamating pan and quicksilver squeezer. As the pulp leaves the apron plate 4-inch iron pipes carry it to the concentrating room, entering just under the eaves. Here, against the inner wall, quicksilver traps are placed for the pulp to run over; there are sixty of them—one for each battery. As the pulp reaches the concentrating machine, it passes over the distributor, upon which an amalgamating plate. 18 inches by 6 feet, is placed. These plates are cleaned simultaneously with their respective batteries above.

Two concentrators, with belts 6 feet wide, handle the pulp from each battery. The vanners are driven by two water motors, 30 inches in diameter and placed just under the comb of the roof. This arrangement admits of two tanks being placed under the motors and saves the discharge; it is piped by gravity to all the machines. The vanners are in four tiers of thirty machines each. The building is 80x300 feet, allowing a floor space of 200 feet for each machine. It is in this room that the extra man in the 300-stamp crew is employed. He is hired to run the kicker. In the 240-stamp mill the vanner men handle the kicker, as the concentrating machines there are only 4 feet wide. The kicker is light and is attached temporarily to and driven by the motor of the vanner machine. The kicker used in the 300-stamp mill is a local invention; it is placed across the aisle, tapping two boxes at once; it is driven by compressed air, and is used to expel water enough from the sulphurets so they can be handled without waste. There are two aisles in the building, one of which is shown in the engraving. A man is employed in each to regulate its sixty machines and see that they do their work properly. Nothwithstanding the large number under each man's care, the machines look bright and clean. As the mill was originally planned the vanner room was to form two wings, with sixty machines on each side of the battery building; but the plan was changed to the present one to save further excavating into the hill. This change of plan makes it very pleasant in the concentrating room, separating it from the deafening roar of the batteries. A track is laid in each aisle, cars run in and are loaded with sulpherets; a locomotive is attached and pulls the cars up a trestle built over the wharf, when the sulphurets are dumped into the hold of a coal hulk and shipped as return cargo to the smelter at Tacoma.

The mill is crushing daily 1300 tons of ore, which yields almost 2% of concentrates, as the mill is now producing twenty-five tons per day. The assay of mill tailings on the island will surprise a great many California mill men, as it runs usually from 10 to 15 cents per ton, though a great many assays show only a trace. The low rate of loss is due, I have no doubt, to the uniform distribution of the sulphurets in the mass of ore. The mill is well lighted throughout, requiring 480 incandescent lights. The electricity is supplied by a dynamo situated in the compressor room at the mine hoist.

We will now compare the crushing capacity of the new mill with the company's old 240-stamp mill, taking it for granted that the old mill was up-to-date when built fifteen years ago.

A stamp of the new mill weighs 1080 pounds, falls 7 inches 101 times per minute. Reduced to 9544.5 foot tons.

A stamp in the 240-stamp mill weighs 850 pounds, drops 6 inches ninety-eight times a minute. Reduced to 4998 foot tons.

The crushing capacity of the new mill seems more comprehensive when we say that 32,724,000 pounds of metal drops 7 inches on the ore every minute, and that this great force is used to extract a metal invisible to the naked eye; that one minute's dropping of so many million pounds of iron produces one-seventh of an ounce of gold, and even then one-third of this value is in the concentrates, requiring roasting and smelting, besides a transportation of 800 miles to the smelter.

The crushing capacity of the new mill is 90% greater than the old one. The additional drop and rate of speed is accounted for in the style and shape of the cams, those of the new mill being longer and straighter. A great many mill men favor the old-style cam, with light stamp, claiming it requires a less percentage of power to drive it, and that this idea is adopted generally in California now in building new mills. The 240-stamp mill was built to be run by both steam and water—the new one by water only—and was shut down from the end of December to March 21st last winter.

In southeastern Alaska, where the rain is always on tap, so to speak, the country mountainous, suitable for ditching purposes and securing water power at high pressure, the new style of mill has come to stay.

The late Captain Thomas Mein was consulting engineer for the Treadwell Co. when the new mill was planned and was superintendent here before going to South Africa; he was, therefore, well acquainted with all the details of the milling question on Douglas Island, and the new mill stands as his last work of a long, busy life, whereby he secured a maximum of crushing capacity with a minimum of labor—a parallel of which will be hard to find. Angus McKay was superintendent of construction, and G. W. Hewitt is now foreman of the mill.

* See illustrations front page.

Issuance of U. S. Patent.

TO THE EDITOR:—In your issue of May 26th you state in "Concentrates" that application for patent does not relieve from assessment work.

This statement is of interest to us; we hold a receiver's receipt from the Land Office for a patent to a quartz claim, for one year and nine months, and the patent has not been issued yet. Do you think it is necessary to do assessment work on a claim after the money for the patent has been paid into the Land Office and the applicant holds a receipt for such patent?

What can we do to hurry the issuing of the patent?

Bourne, Or., June 1.

The "Concentrate" referred to was in answer to an Idaho subscriber who asked if mere application for a patent absolved him from any further necessity for annual assessment work. The Bourne, Or., matter is entirely different. In this case the inquirer states that he has filled all the requirements and gone clear through with all expected from him. The delay in issuance of the patent is merely a clerical one, and not chargeable in any way to dilatoriness or neglect on the part of the miner. He has done all that is required, and to all intents and purposes is presumably in possession of patented ground. The mere receipt of the patent itself is incidental. Nothing can be done to hasten its issuance. In the fullness of time it will be sent from Washington, D. C.

PREVIOUS to 1882 an average of 80% of all the copper produced in the United States came from the mines bordering Lake Superior. In the following year—1883—the Lake Superior region produced 51.6%, Arizona 27% and Butte, Mont., 21.4% of the domestic copper. The percentage of the Butte output continued to increase steadily, and in 1887 it became greater than the yield from the Lake Superior mines. This lead has ever since been advanced until in 1898, when 60% of all the world's copper was supplied by the United States, Butte furnishing 41%, Lake Superior 30% and Arizona 21% of all the domestic production. Thus Butte practically furnishes a quarter of the copper product of the world, nearly one-half of which is the output of a single company—the Anaconda.

Pinal Consolidated Mine Tram and House, Near Florence, Arizona. (See page 675.)

T. K. ROSE has conducted a series of experiments on the electrolytic recovery of gold from cyanide solutions in which mercury and amalgamated copper plates were used for receiving and retaining the deposited gold. It was found that the electric current had to be of very low density, about 0.01 ampere per square foot of receiving service, to obtain complete amalgamation of the gold removed from the solution, since stronger currents threw down a portion of it in the form of a black powder, which would neither amalgamate nor wash off the surface of the mercury without brushing or wiping. The proportion of black powder increased rapidly with denser currents until most of it was deposited in this form. Consequently for the adequate recovery of the gold by electricity and amalgamation a low density of current was essential, and this necessitated a large cathode or receiving service. Owing to the high cost of mercury and also to the outlay in providing large copper plate services, the author arrives at the conclusion that the lead cathode at present in use is not likely to be superseded by a mercurial or amalgamating one. Furthermore, it was found that the amalgamated copper plate cathode was attacked, in spite of the electric current, by the cyanide solution, to the detriment and waste of the latter. This would further militate against the practical use of these plates.

THE hardened end of a steel bit or chisel broke off in a bore-hole 165 fathoms deep, put down near Ostroppa by the Upper Silesia Deep Boring Co., Zoellner & Co., and this obstruction effectually prevented further boring of the hole, because all diamond crowns wore away. After the most varied attempts had failed to remove the piece of steel, the following plan, says the Colliery Guardian, was hit upon by Engineer Degenhardt of Gleiwitz. A soft steel bar, 5 feet in length and 2.7 inches diameter, was covered by a single winding of india-rubber tape and magnetized by the current of a small dynamo driven by the portable engine employed for the work of boring, and the current was kept constant at about 30 amperes by means of a simple resistance coil. The steel bar was let down into the hole magnetized, and when it reached the bottom the current was switched through the conductor enclosed in the rope for letting down and drawing up. On the first day that this method was employed the piece of steel was drawn up to the surface, so that boring could be resumed.

A CHICAGO stock brokerage firm has leased a private telegraph wire from Chicago to San Francisco. They already have a private wire from New York to Chicago, so that they now control for their own exclusive use a wire service of 3000 miles from ocean to ocean. The 1000-mile section of wire from New York to Chicago costs $18,000 annually.

The Use of Aluminum Line Wire and Some Constants for Transmission Lines.*

NUMBER II.—CONCLUDED.

By F. A. C. PERRINE and F. G. BAUM.

The wire used was intended to be equal to No. 3 B & S copper wire in its electrical resistance, and the manufacturers were required to furnish this conductivity in a wire not weighing more than 420 pounds per mile. All the wire supplied was carefully inspected by A. E. Kennelly, and his reports give the following averages for the total quantity:

Diameter	293.9 mils
Weight per mile	419.4 pounds
Resistance per mil foot	17.6 ohms at 25° C.
Resistance per mile at 25° C	1.00773 ohms
Conductivity compared with copper	59.9% by dimension
Tensile strength of wire	1549 pounds
No. of twists in 6 inches for fracture	17.9
Tensile strength per square inch	32898

Comparing this with copper, it is seen that this wire is approximately the same as copper in the following sizes:

Size of aluminum wire = No. 1 B & S copper
Resistance of aluminum wire = No. 3 B & S copper
Tensile strength of aluminum wire = No. 5 B & S copper
Weight of aluminum wire = No. 6 B & S copper

Therefore, on the basis of the same conductivity, the aluminum compares with copper as follows:

Diameter for the same conductivity	1.27 times copper
Area for the same conductivity	1.64 times copper
Tensile strength for same conductivity	.629 time copper
Weight for same conductivity	.501 time copper

The mechanical properties of this wire present some well marked characteristics. In the first place, the number of twists necessary for fracture varies considerably, although the ductility test of wrapping six times around its own diameter, unwrapping and wrapping again is well sustained. This irregularity in the twisting test is generally a mark of impurity in wire, but we know so little as yet of the exact characteristics of aluminum in particular, and the twisting test is in general so unreliable that it is unsafe to base any exact statement on this one test, particularly as the same after erection proved reliable. In carefully performing the test for tensile strength no exact point could be assigned for the elastic limit, as the metal seemed to take a permanent set almost from the first, but, at a stress of from 14,500 pounds to 17,000 pounds per square inch, there is a marked increase in the permanent set which indicates that the safe working load lies somewhere in this region. In this the characteristics of the aluminum do not differ materially from those of copper or other similar metals, and while this is a disadvantage it is not a singularity.

The fact that the wire will permanently elongate if seriously strained makes it necessary to use the utmost care in the erection of lines, and also the known high coefficient of expansion with temperature changes taken in conjunction with this property renders care in line stringing especially important and difficult.

Instructions to line foreman in stringing wires:

1. All spans are to be strung with deflections and tensions as specified.

2. Up and down hill spans to be sprung to correspond with level spans. In case level spans cannot be used, then employ dynamometer, and ease all wires over cross-arms.

3. All ties are to be made at one time by signal.

4. All ties are to be made crossing wires around insulator serving three times around wire, and twisting behind insulators; the ends of the tie-wires are not to be cut but bent back toward insulators.

5. All the wires on the outside of the insulators, except at corners where all are to be tied so that the strain is against the insulator.

6. Joints are to be made by means of sleeves twisted two and a half times, the ends of the wires being given one turn by hand around the wire; no tools being used, except in twisting the sleeves, and cutting of the ends of the wires. Before inserting the wire in the sleeve, the ends of the wire must be roughened by draw-filing.

7. Barb wire is to be laid along the roof of the pole and held by three staples driven in tightly, but without kinking the wire. Ground wires are to be soldered to the barb wire, and at the bottom of the pole to the wire leading from the ground plate. All soldering acids must be carefully washed away after the soldering is done.

8. Beginning between poles one and two, all wires are to be barreled by shifting one pin, and same to be repeated between poles 21 and 22, and 41 and 42, and so on. Barreling always in the same direction of twist every twenty poles. A record must be kept of the location of every wire and every pole.

GENERAL CAUTION.—The greatest care must at all times be taken against kinking or scarring the wire; wherever the wire is accidentally kinked or scarred it must be cut and spliced.

The targets consisted of light sheet iron strips about 2 feet long and 2 inches wide, with aluminum hoop bent into an eye at the top, by means of which they could be hung from the line wire. These targets were painted in three or four colors, with bands 1 inch wide. In use the captain of the linemen would hang his target on the wire to which a man on the next pole had also hung a target; then, as the wire was being pulled into place, he would sight from a band on his target to the same band on the adjacent target, and when the wire came into line with these two bands the signal would be given for all the linemen to tie at once. As a result of this method of stringing, an exceedingly uniform line, and one strong in accordance with the temperature was obtained.

One of most serious problems in connection with the use of aluminum is in the choice of a proper joint. This metal is so highly electro-positive that it is unsafe to expose it to the elements in contact with any other material, as electrolytic corrosion is almost sure to follow such construction. Many of the failures which have been reported of this metal have been due to a neglect of this fact, as notably in cases of the plates on the yacht Defender, where the plates have been corroded at the contact with the bronze rivets used in fastening them to the frame. Whenever this metal is soldered or used in contact with any other metal, the joint should be thoroughly waterproof to prevent such action. After discussing many joints, it was finally determined to abandon any attempt to solder or clamp the wire in any manner, and the joints were made by slipping the ends of the wire into an oval aluminum tube about 9 inches long, which was then twisted with a pair of clamps similar to those employed in twisting the McIntire connector. After twisting the tube a turn was taken by hand of the loose ends, and the wire cut off close. The joint produced proved practically equal to the original wire in both tensile strength and electrical conductivity.

This wire was erected during the winter 1898-99, which was an unusually open winter over the whole State of California, allowing practically continuous construction work, though the temperature varied all the way from about 30° F. to 80° F. at times when the wire was being strung. After it was finally erected it remained about three months on the poles before the machinery was delivered and put in place. During the first month of that time three breaks occurred which were all apparently due to flaws in the material, but after these breaks were repaired the line wire gave absolutely no trouble whatever, various accidents occurred to other parts of the construction. Many insulators were shot at and broken, bale wire and bale rope were thrown over the line, a twig short-circuited one phase and fell down burned, a large bird was killed by contact with the wires, and finally several porcelain insulators with porcelain pins were broken off and hung suspended by the wire. In January and February of the present year this whole line was taken down to give place to a much heavier one of the same material, an opportunity for an entire change having been found after the total destruction of the power house by fire last November.

During the past two years other lines of aluminum wire have been erected on the Pacfic coast, all but one of which have given a considerable amount of trouble from causes that are not entirely apparent.

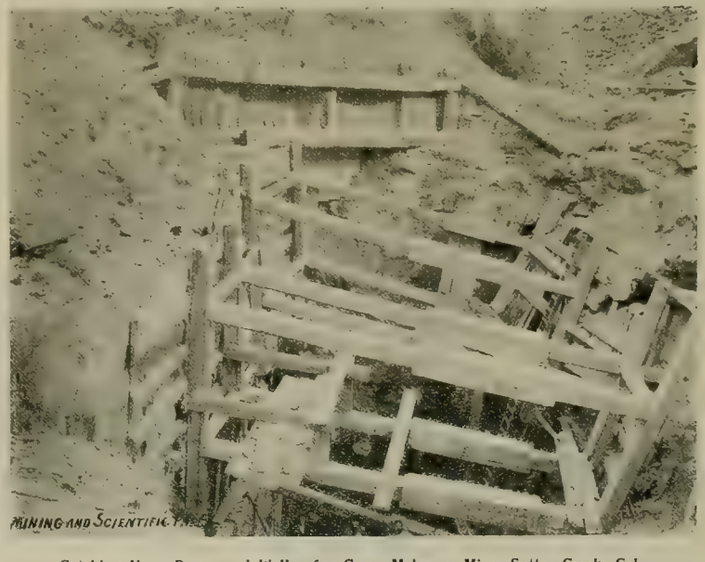
One line in Nevada county, erected at about the same time as that we have been describing, and for which the wire was of practically the same lot, has given no trouble whatever.

The power transmission lines of aluminum wire about Seattle have broken a few times but have not given serious trouble. The breaks in this line, so far as the writers have been informed, seem to have been due to not allowing enough sag at the higher temperatures, and a consequent overstraining of the wire to cold weather.

The most serious difficulties have been encountered by the telephone company in Washington and Oregon, and by the Yuba Power Company. In all of these cases it seemed almost impossible to keep the wires on the poles in certain sections, and in these portions the lines have been finally taken down and replaced by other wire of either copper or aluminum. The writers have examined many breaks from these lines, and would judge, from the appearance of the fracture, that the cause, whatever it may be, was similar. In those breaks there are many small flaws, but by far the greatest majority are clear, sharp fractures, with but a slight reduction of area, and that entirely on one side, a break very characteristic of improperly mixed and brittle alloys. Partially from the appearance of the fracture, and partially from the facts the breaks occur only in certain sections of the line, the writers are of the opinion that this trouble is due to the presence of impurities in the material. This view is strengthened by the fact when measurements were made on the line of Yuba Power Company, the resistance of the whole line was found to be 10% greater than it should have been if it were made of the quality of material described in the earlier part of this paper.

As general conclusion, it is the opinion of the writers that aluminum can be safely used in place of copper where the proper precautions are taken in inspecting the wire before it is erected, and in erecting it with due consideration of its perculiar properties of low and indefinite elastic limit, high coefficient of temperature expansion and active electrolytic power.

Indicating our faith in this opinion, it may be noted that for the new line soon to be erected an aluminum strand ⅜ inch in diameter has been ordered. This strand will be spliced with aluminum sleeves.



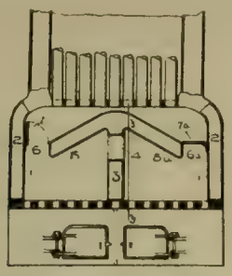
* Abstract of paper read at the seventeenth general meeting of the American Institute of Electrical Engineers, Philadelphia, May 16, 1900.

Mining on the California Gold Belt.

NUMBER IV.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS, Assistant State Examiner of Mines.

The accompanying engraving, from a photo taken specially, illustrates more clearly than words the manner of catching up a dump and the crumbling walls of a cave in the open cut of the Mahoney mine of the Wildman Co. at Sutter Creek, Cal. Many years ago the former operators excavated large stopes between the 200 level and the surface of this mine, and a great quantity of ore was also taken from open cuts. Last January the ground standing between the roof of one of these old stopes and the open cut suddenly caved. No one was injured, as the ground was recognized as being particularly bad and no men were employed there. The cave was at first about 4 feet square, but in a few hours had enlarged to four times this area. A large dump at the end of the cut threatened to slump into the hole, which was hourly growing larger. It was determined to make an effort to catch the dump and also, if possible, to stop the further caving of the ground. Mgr. John Ross and his foreman, Stephen Thomas, devised a plan which was executed with dispatch. Twelve to twenty men were employed for several days, and the ground was all secured and hundreds of tons of good ore was recovered and sent to mill. The first work consisted in placing the two heavy spliced timbers and three posts seen in the background. The horizontal members of this set were about 30 feet long and 18x20 inches thick, with splices 20x12 inches, 16 feet long, bolted at the center. These were placed fearlessly while the ground was actually caving under the feet of the workmen, but desperate situations demand desperate measures. The main members were placed in position and secured by old mine cables to "dead men" located in solid ground some distance away. The spiling was driven behind the set and the dump was secured from running down into the mine. The remaining members of the sets were then placed in position piece by piece, the hole being constantly enlarged by caving and being broken down, the cave proceeding toward the standpoint from which the picture was taken. The ore passed down into the old stopes below, with much waste, which, under the circumstances, was unavoidable, of course, and this was drawn off through chutes, sorted and sent to mill. The entire operation was ingeniously handled and assisted by lack of rain, which at that particular time would have probably caused a disastrous run of the surface ground.



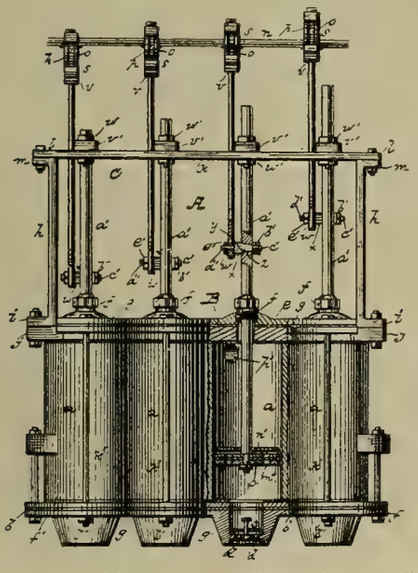
Catching Up a Dump and Walls of a Cave, Mahoney Mine, Sutter Creek, Cal.

Mining and Metallurgical Patents.

Patents Issued June 5, 1900.

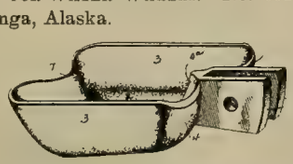
Specially Reported for the MINING AND SCIENTIFIC PRESS.

FURNACE.—No. 650,821; C. M. Bump, Bay City, Mich.



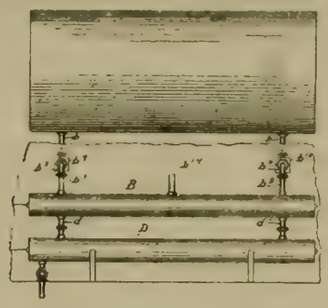
In a water-heating furnace combination with grate of vertical water-containing partition dividing grate surface into two parts; gas passage through partition; water-containing top for partition extending laterally over fire; dampers for regulating gas exit between laterally extending top and furnace wall.

PICK.—No. 650,882; W. F. Walker, Charlestown, W. Va.



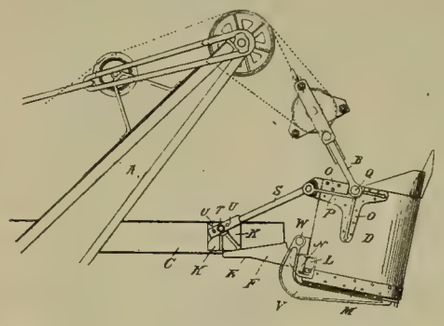
In a miner's pick, combination with handle, of clip having socket in which handle is engaged, oppositely extending shoulders at sides of clip having threaded perforations, set screws engaged with perforations, parallel lugs extending longitudinally from outer end of clip and separated by interspace, lugs having alining perforations formed therein, head between lugs and having perforation registering with perforations of lugs, and pin engaging alining perforations, pin having lesser diameter than perforations and head lying in path of outward movement of set screws, whereby head may be moved outwardly to engage and move pin outwardly and cramp it against outer walls of perforations of lugs to prevent its displacement and to hold head upon handle.

PUMP.—No. 650,896; J. M. Green, Mill Creek, Utah.



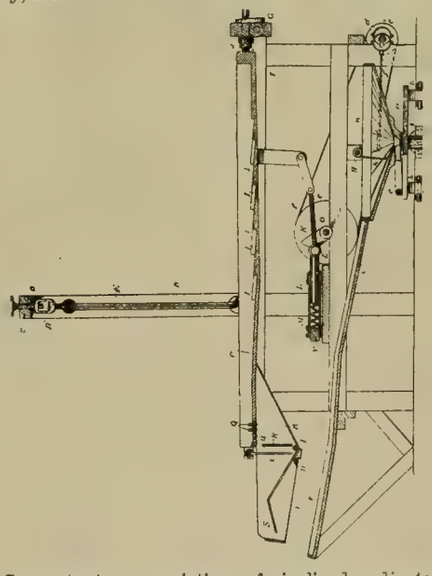
Pump, comprising series of cylinders, having offset and formed of single piece, lower plate provided with perforated cups and valves c, plates b, B, top plate e, pistons, having perforations and formed of two parts, having packing, and valve n′; reservoir mounted upon offset communicating with cylinders by channels p′, and valves t′, arranged above channels and within reservoir; piston rods, having openings z, wedge-shaped blocks or arms y, pitmen and frame, composed of end standards, side bars and cross-bars v′, and eccentrics, mounted on shaft n.

BUCKET FOR WATER-WHEELS.—No. 651,101; F. R. Brown, Unga, Alaska.



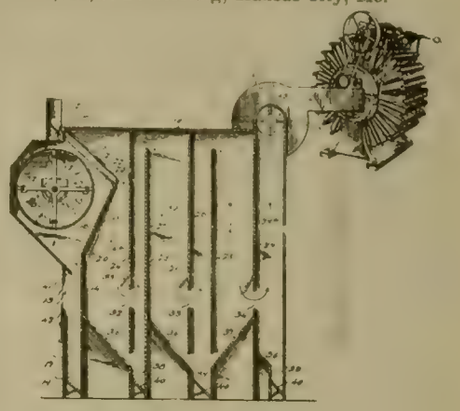
A bucket for water-wheels, comprising cup-shaped casting having perfectly flat bottom and outwardly flaring divergent sides, inner and outer ends of bucket each having two outwardly flaring curved or bulging portions separated by inwardly projecting rib curved in cross section and gradually merging at its lower end into flat bottom of bucket.

ATTACHMENT FOR PREVENTING BOILER INCRUSTATION.—No. 650,916; W. A. Sheets, Lexington, Ky.



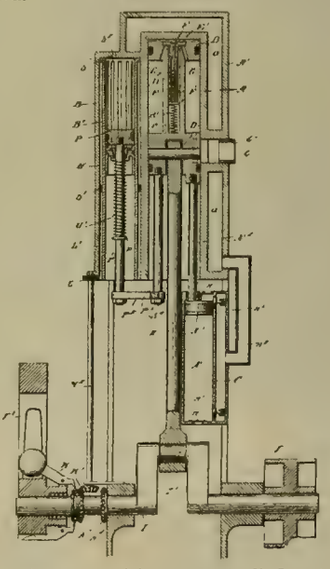
Attachment for preventing boiler incrustation, combination of cylinders located one above the other on outside of furnace wall communicating with each other by pipes at their opposite ends, pipes at opposite ends of upper of cylinders passing through furnace wall and communicating with boiler or boilers at under side whereby water is caused to circulate through cylinders, sediment collected therein and purified water returned to boilers, and blow-out pipe connected to lower of cylinders for discharging sediment from them.

DIPPER ATTACHMENT FOR DREDGERS.—No. 650,991; A. W. Robinson, Milwaukee, Wis.



Combination, in dredger dipper, of arm or handle, plate having flanges which embrace end of handle, lugs on plate, plate extending across lower rear side of dipper overlapping bottom lap streak thereof and having lugs thereon which with those on arm plate form hinge, and means to confine upper edge of dipper in proper position.

CONCENTRATOR.—No. 651,006; S. T. Curtis, Virginia City, Nev.



Concentrator consisting of inclined adjustably suspended and supported table, with bottom composed of steps or offsets, and mechanism by which table is given longitudinal and concussive movement, subdivided trough carried by lower end of the table, with means for discharging material reaching that point upon opposite sides of partition of trough, fixed arms projecting into trough whereby material therein is agitated and loosened, discharge pipe or pipes upon bottom of trough, overflow from outer edge of trough, screen into which overflow is received, with passages by which material arrested thereon is delivered from either side, fixed apron upon which material passing through screen is received, chute delivering material into vertically journaled pan, means by which pan is oscillated about its shaft, supporting plate beneath pan and rollers upon which plate rests, central discharge pipe from pan, and stationary fingers projecting into pan to agitate contents.

APPARATUS FOR SEPARATING GOLD FROM SAND.—No. 651,022; J. P. Sterling, Kansas City, Mo.

Pneumatic apparatus for separating gold from sand, primary passage having pocket at lower end, air inlet port above pocket and outlet port in upper side, in combination with screen mechanism in upper portion of primary passage and series of alternating drop passages and uptake passages, one of former communicating with outlet port of primary passage, uptake passages having pockets at lower ends communicating therewith and with lower sides of drop passages, uptake passages communicating with drop passages at upper ends, further provided with intermediate ports above pockets communicating respectively with drop passages, baffles in drop passages above ports and means for creating current of air through primary, drop, and uptake passages.

GAS ENGINE.—No. 651,216; F. W. Toedt, Bamburg, Iowa.

A gas engine, comprising power cylinder, two connected pistons therein forming an exhaust chamber between them, cylinder having exhaust ports uncovered by inner or power piston when in its outermost position, power piston having exhaust ports extending through it, valve plate carried by power piston and adapted to be held closed by pressure in cylinder, spring acting to hold valve open, stop engaging plate to close exhaust ports just before ignition, and means for introducing and igniting charges of gas within engine.

PROCESS OF MAKING METALLIC SULPHATES.—No. 650,980; O. Meurer, Cologne, Germany.

Process for manufacturing sulphates of metals, free from iron, from metallic sulphides containing sulphide of iron consisting in mixing ores when containing too high amounts of sulphide of iron with minerals free from sulphide of iron and sulphur, heating mixture with polysulphides of alkalies, cooling mass and causing it to crumble after addition of water, drying mass and subjecting crumbled dried mass to spontaneous oxidation at air, while heating to 400° Fahrenheit and lixiviating afterward oxidized mass with water, whereupon obtained solutions of sulphates are separated from undissolved remains.

ANTIFRICTION ALLOY.—No. 650,911; W. N. Rumely, La Porte, Ind.

Antifriction alloy formed of lead about seventy-two parts, antimony twelve parts, phosphorus .0175 part and tin about 15.9825 parts.

Outlines of Structural Geology.

Written for the MINING AND SCIENTIFIC PRESS by J. A. EDMAN.

The science of geology of the present day in teaching us the structure of the earth and the mode of upbuilding of its crust gathers its evidence from the accumulated observations and experiences of centuries, and from all parts of the globe, and the general laws it presents apply, therefore, not to one country alone but to all. In briefly tracing the geological history of the Sierra Nevada we, therefore, review the general sequence in the upbuilding of continents, while inquiring into the special conditions that have contributed to give their distinctive characters to the gold-bearing rocks of the Sierra.

The forces instrumental in forming the outer crust of the earth and in maintaining, modifying and altering the same are either igneous or aqueous, the one representing the action of heat, the other that of water and watery vapor. It is generally conceded that the primary rocks of the globe were of igneous origin, and that they contained practically all the elements from which subsequent rock formations have been derived.

Whatever these primary rocks were, from them and from subsequently erupted matter were derived all of the material of the various sedimentary formations now found on the earth, and from the first appearance of land at the surface the formation of new strata has been proceeding in ever widening cycles and under general and immutable laws.

In geological development the igneous forces seem to represent intensity, the aqueous quantity, and the latter, being the most widespread and predominant, will here be first considered. The phenomena of sedimentation deal not alone with inorganic matter, but organic life has everywhere been an active factor in the formation of sedimentary rocks, in their accumulation, consolidation and decay, and this as exemplified in the older geologic systems has a special bearing upon the genesis of the ore deposits of the Sierra Nevada.

Starting, then, from the primary crystalline rocks rising out of a primeval ocean, the air and water represent the ever active elements which in constantly increasing progression have formed new deposits from the ruins of pre-existing rocks. Such deposits may form upon the surface of the land, in the ocean, in enclosed seas, in bays, estuaries or inland lakes, the matter deposited being either in larger fragments, as rocks, pebbles and sand, suspended in the water as sediments, or dissolved in a body of water, either salt or fresh. Of the latter condition, the salt of the sea is the most prominent illustration, as it resulted from the gradual solution of the soda minerals of the rocks. The solid matter thus derived from the erosion and degradation of pre-existing rocks gave rise to the first sedimentary deposits, and these being again acted upon by the aqueous forces originated later deposits of fragmentary material, the rocks of the Carboniferous and later eras chiefly represented in the Sierra Nevada being made up from the fragments of Archæan, Cambrian, Silurian and Devonian formations, of which, however, only a part have been clearly defined on this coast. They must of necessity represent all the substances contained in these rocks not dissolved out of them by the great upbuilding and disintegrating element of the world, water and watery vapor.

It is conceded that the original or Archæan rocks contained all the chemical elements we know of as original constituents of the earth's crust, inclusive of the metallic elements, and as a consequence the gold, silver, copper, lead, iron, manganese, etc., which we now find in mineral deposits must have been present in the former seas of all periods. It is, however, to be noted that whereas the erosion of the primary period affected only the original rocks, that of later eras also acted upon the older sedimentary formations, which in their turn furnished material for new deposits.

During all these ages the waters of the globe, besides their eroding and transporting capacity, also dissolved certain and often large percentages of the elements of the rocks with which they came in contact, and chemistry has taught us that nearly all of these elements are now found in solution in the waters of rivers and lakes, but chiefly in the ocean. The most abundant are lime, magnesia, alumina, potash, soda and silica, combined with carbonic acid, chlorine and sulphuric acid, and, of the metals, iron, manganese, lead and copper, and in less quantity silver and gold. In the waters of lakes and rivers many of these elements are found in stronger solutions.

It is evident that if the solvent power of the water has been constantly exerted a time would certainly come when the waters of the sea would become saturated with mineral matter, and consequently unable to support life, and nature, therefore, wisely provided for processes of precipitation and separation, by which means the elimination has kept pace with the solution, and the precipitated matter has been added to the sands and sediments, and has formed an integral part of all our formations.

The elimination processes were partly chemical, such as the crystallization of salt and the formation of sulphides by the reducing action of organic matter in suspension in the water, and partly organic, such as the secretion of lime by the myriads of coral and shell-forming organisms and the separation of silica by diatoms and other infusoriæ, by which two processes alone vast beds thousands of feet in depth and hundreds of miles in extent have been formed.

The latter processes of deposition from solution, being contemporaneous with the deposit of sediments in suspension, have in the course of ages furnished us with the sedimentary formations of the globe, and these must of necessity contain all the materials and elements of the rocks preceding each formation, in most instances pretty evenly distributed through the various beds.

To bring about concentration, nature, however, provided a plan to enrich even the sediments, which was chiefly by constant oscillations of the surface of the land, by which deep seas and bays became shallow and finally land-locked, and a concentration of solutions and consequently more active chemical and organic precipitation became possible over limited areas, which is exemplified by the growth of coral reefs and the formation of salt beds. In most instances these special deposits again subsided beneath the sea and were covered by new strata.

Had nature rested then, we should have had nearly horizontal sedimentary strata, with an occasional concentration of special minerals at or near the junction of two beds, as was the original condition of various deposits in California.

But an allwise Providence had ordained that still greater concentration of useful minerals should take place before the earth should be occupied by the last and most advanced of the animal creation, to enable man to fulfill his destiny on earth, to which end the igneous forces of the globe were called into co-operation with the aqueous already referred to. Evidences of these forces are found even among the oldest sedimentary beds in the vast sheets of effusive rocks poured forth originally as lavas from active volcanoes, or the often equally large masses intruded between strata from subterranean outlets, and these flows of volcanic rocks were supplemented by great accumulations of fragmental matter from subaerial volcanic vents, as bombs, lapilli and ashes, as well as mud flows, all of which are often found superimposed upon distinctly sedimentary rocks and forming a special feature among the metamorphic rocks of the Sierra Nevada. It is to be noted that many of these igneous deposits mark periods of oscillation of the surface and a change from a deep sea to a shallower, from a shallow sea to dry land. It should also be remembered that great changes in the physical character of the sea occurred during the inflow or deposit of volcanic material, in the temperature and chemical constituents of the sea water and its capacity for solution and deposition.

(TO BE CONTINUED).

Tellurium and Its Compounds.

Tellurides are compounds of the metal tellurium, with other metals. The varieties include many ores valueless to the gold miner, such as the tellurides of mercury, lead, bismuth and nickel. Men sometimes speak of tellurium when they intend to refer not to that element itself, but to its compounds with gold and silver. Tellurium is a metal; it occurs native, in a free state, as gold and silver do. It is tin-white in color, soft, but brittle, and usually occurs in a granular massive condition. Its commercial value is $4.00 per ounce, but the demand for it in the arts is very slight, and a few shipments quickly demoralize the market, as is the case with most of the rare metals. In Boulder county, Colo., native tellurium often occurs in gold ores, and a mass of twenty-five pounds was once found in the John Jay mine, near Jimtown.

All the tellurides have a rich metallic luster, most of them are steel-gray to iron-black in color, and they are all heavy, ranging in specific gravity from 7 to 9. If a mineral is suspected of belonging to this class remove a small bit of it with the point of a knife and put it in a porcelain dish or white saucer. Then add a couple of drops of strong sulphuric acid and heat it over a lamp. Should tellurium enter into the composition of the suspected mineral you will quickly see a beautiful purple suffuse the colorless acid. The miner's time-honored test is to put the specimen in the fire of a blacksmith's forge, where it is roasted. Tellurium fuses at a low temperature, and becomes volatilized, passing off in white fumes of telluric oxide. If there be gold present it remains in globules. If more precious telluride be hidden in cracks within the specimen the gold will be exuded in a yellowish perspiration. The experienced miner has learned that all telluride ore is not rich from the disappointing returns of many a shipment to the smelter, and while he does not know whether the delusive mineral be native tellurium or a compound of one of the baser metals, he does know that gold may be absent and that a rough test, such as roasting, is of assistance. Some miners are apt to call everything native tellurium that does not stand this test, but it should be pointed out that the experiment would fail to distinguish the telluride of mercury, because mercury volatilizes easily and passes off in fume. The telluride of mercury is called Coloradoite, because it was first found in that State, in the Mountain Lion mine at Magnolia. A simple test is to roast a particle in a glass tube, when the mercury liberated at the hot end will pass off in fumes which will condense into metallic globules at the upper or cooler end of the tube.

Coloradoite is grayish-black, and has a rich luster. The most valuable ore of tellurium is Calaverite, the tellurium of gold. It is named after the county of Calaveras, in California, and was first determined by Professor Genth from specimens furnished by the Stanislaus mine. Cripple Creek, Colorado, ores contain Calaverite, and it occurs in those of Boulder county, especially in the Horsfall mine, at Gold hill. The typical mineral contains 44.5% gold and 55.5% tellurium, but the ordinary varieties carry about 3% of silver, replacing some of the gold. The purest varieties have a bronze-yellow color. Calaverite is difficult to distinguish from iron pyrites, as the difference in color is slight, the streak of the former is yellow-gray and of the latter brownish-black. The easiest mode of distinguishing between them is by their hardness, Calaverite being two and one-half (or easily cut with a knife), while iron pyrites is slightly over five (or cut with difficulty by a knife). The cubic crystalline habit of pyrites will help to make it known, for Calaverite rarely occurs in any but a massive form.

Calaverite is the telluride of gold; hessite is the telluride of silver. Hessite resembles argentite, sulphide of silver, often called "silver glance" by miners. The former contains 62.8% of silver and 37.2% tellurium; the latter is composed of 87.1% silver and 12.9% sulphur. Both are sectile—that is, can be cut by a knife, like wax, and both are steel-gray to iron-black in color, the silver sulphide being decidedly darker than the corresponding telluride. Fine specimens of hessite have been found in Boulder county. At the Golden Fleece, in Hinsdale county, Colo., hessite occurs associated with petzite, and in the Shoofly mine, in the La Plata mountains, Colorado, it accompanies sylvanite.

Hessite is frequently impure—that is, gold enters into its composition, so that it finally gradates into petzite, which contains 41.86% silver and 25.60% gold, combined with 32.54% tellurium. Petzite, although darker, is also steel-gray to iron-black in color, but it is far more brittle than hessite. The Village Belle mine, at Eldora, Colorado, yields a massive variety, and the Golden Fleece ore contains petzite and hessite so intimately associated as to make it difficult to distinguish them. Petzite, like all the tellurides, has a rich luster suggestive of a mineral containing the precious metals, and though it is usually common wherever tellurides occur, it is not common in the Cripple Creek district.

Sylvanite is another double telluride of gold and silver, containing a little more gold than petzite and less silver, its composition being 28.5% gold, 15.7% silver and 55.8% tellurium. The two minerals are, however, easily distinguished, sylvanite being steel-gray to silver-white, and a brilliant, beautiful mineral having a characteristic crystalline structure, to which it owes its name of graphic tellurium, the arrangement of the crystals resembling Arabic lettering. It is much softer than petzite. Fine specimens of it occur plentifully at Cripple Creek, Colorado, especially in the Independence, Portland, Moon-Anchor and other properties. It is also a characteristic ore of Boulder, especially in the Salina district. Sylvanite loses its silvery sheen when it undergoes decomposition, the tellurium becomes oxidized and the gold which finally remains often retains the crystalline form of the original mineral—that is, it is pseudomorphic, after sylvanite. Specimens of gold having this structure are frequent in the Cripple Creek ores.

The above are the chief ores of tellurium containing the precious metals. The telluride of lead, called altaite, often carries gold and silver as an impurity. It is a tin-white mineral and soft. Nagyagite is a variety containing 9% gold and 54% lead. Silver and copper also usually enter into its composition. This mineral is very soft; it is black to lead-gray in color, and has a foliated structure which renders it peculiar among tellurides. Both these last-mentioned minerals occur in Boulder county, Colo., especially in the Jimtown district.

The telluride of bismuth, tetradymite, and that of nickel, melonite, are very rare. The accompanying list may prove useful for purposes of reference:

Calaverite, tellurium, 56%; gold, 44%; hardness, 2½; color, bronze-yellow.

Hessite, tellurium, 37%; silver, 63%; hardness, 2½ to 3; color, steel-gray.

Coloradoite, tellurium, 38%; mercury, 62%; hardness, 3; color, iron-black.

Tetradymite, tellurium, 48%; bismuth, 52%; hardness, 1½ to 2; color, pale steel-gray.

Melonite, tellurium, 76%; nickel, 24%; hardness, 3; color, reddish-white.

Sylvanite, tellurium, 56%; gold, 28%; silver, 16%; hardness, 1½ to 2; color, silver-white.

Petzite, tellurium, 33%; gold, 25%; silver, 42%; hardness, 2½ to 3; color, iron-gray.

Altaite, tellurium, 38%; lead, 62%; hardness, 3; color, tin-white.

Nagyagite, tellurium, 32%; lead, 54%; gold, 9%; hardness, 1 to 1½; color, lead-gray.

A mineral scratched by a finger nail has a hardness of about 2; one which is cut by a knife is about 5½ in the scale of hardness. The composition of all these minerals varies according to the locality, producing varieties which the mineralogists recognize, often under special names which complicate the study of the subject.

A Contract System.

There are two ways, says the Rossland, B. C., Miner, in which contract work is usually undertaken in a mine: the one is the method of paying for each foot of advance and the other per ton extracted. The first is open to the objection that untrained men will not break away as much rock at each lift as men who are better skilled. Sometimes an excessive quantity of dynamite is used, and sometimes the holes are not broken out to their full extent. The loss partly falls upon the miner, as he gets paid only by results, but also upon the mine owner, who loses much important time in getting his work forward. The loss falling on the men will too often occasion them to form the opinion that the remuneration received for the work done is not commensurate with the exertion applied. Moreover, the waste of dynamite is frequently considerable. Again, this kind of contract, though readily applicable to straight driving or sinking, can not easily be used in stoping. For in this latter case the excavation, instead of being regular, follows the shape of the deposit, which, lying often in curves, convexities and concavities, has a breadth extremely variable. Hence it can not readily be calculated.

On the other hand, the method of payment per ton extracted is open to the same objections, and has another superadded. This is the cumbersome nature of the necessary details and the expense entailing thereunto in order to keep each man's output separate from that of his fellow worker. There is also another objection, which is equally applicable to either of these systems, and that is that both are insufficiently elastic. For should it be requisite in the economical working of the mine to set an extra number of drills going at any one particular part of the backs, faces or headings for a short period, fresh contracts have to be laboriously entered upon with a consequent loss of time, which is itself the very essence of the reason of the temporary change desired.

At the War Eagle Supt. Davis has hit upon a third method, which, while retaining all the advantages of contract work, takes upon itself the mobility of day labor. Instead of paying contractors per ton or per foot excavated, they are being paid per foot drilled. A contract is made with each separate machine. Two shifts, each of eight hours, are employed instead of three. One round of holes each of so many feet depth, usually five, is drilled during these two shifts. Nor is the whereabouts and direction of the holes so drilled left to the individual will of the men with the machine. On the contrary, the foreman, a thoroughly competent miner, marks before the beginning of the work the place and the direction of the hole that has to be drilled. Two men at the expiration of the work go round to every heading and charge the face prepared.

It will at once be seen that this being done during the third, or late night shift, prevents time being wasted. The air also is sweet and wholesome by the time the contractors are again ready to proceed. Natural ventilation where existent alone will clear the atmosphere of the generated gases. Thus there is less call upon the blowers or suckers to create an artificial draught so as to render the air fit to breathe within a short period. Even with these artificial appliances, under the old system the air was seldom purified under thirty to forty-five minutes. Here again a saving is effected. In the quantity of dynamite used restriction is necessarily employed, for where it would be hard to detect waste among 400 or 500 employes, it is easy to detect the culprit where only two or three responsible persons are employed for this portion of the work. Further, the system has the great advantage of mobility; the machines can be moved from one part of the mine to another. The only account necessary to be kept is the miners' place of working from day to day, and the rate per foot which is obtaining at the various headings, or backs, at which they are employed.

So much for the theory. Supt. Davis informs a representative of the Miner that it has worked so far exceedingly well in practice. Taking some hypothetical figures, and remembering that 70 feet of drifting was supposed to be a good month's work in such mines as the War Eagle or Iron Mask, the following results are obtained: Seventy feet used to cost the labor of three shifts of two men upon each. In other words, the work of six men for one month represented 70 feet. It is now found that four men under the new system will accomplish 100 to 125 feet. To effect this latter amount under the old system fifty to sixty days would be required at an average payment per man of $3.50. Now this same work is done by four men, who obtain a considerable higher wage. A saving of 40% is thus effected. More than this there is less misdirection of energy, less waste of skill, time and material, which together will bring the economical working of the mine under the present system in vogue to an even smaller percentage on the older method.

Nor must it be considered that this saving is made from out of the vital reserves of the miner. He is only working eight hours a day, and he can do, and maintains that he is able to do, as much in those eight hours as in ten with less fatigue. Fewer men are employed at any one heading, but this is fully made up by the greater amount of back undercut on which other machines can be employed. Further, as this method reduces the cost of mining, bodies of low-grade ore formerly untouchable, as they would not pay the expense of working, are now brought into the mining practicabilities, and men will soon be stoping out deposits that formerly had to be left alone.

Thus, from either point of view, from that of the worker or from that of the operator, system is a great success. It employs more men at a higher wage, and yet does more economical work.

New Mexico Artesian Well.

Herewith is an engraving from a special photograph of an artesian well drilled in the Pecos valley, New Mexico, with a big Keystone driller. A local account says:

"The flowing stream came boiling out of the 5½-inch casing and stands 24 inches above the top of the casing. The flow is estimated at from 1400 to 1800 gallons per minute. The rule heretofore has been to allow 100 gallons for every inch the flow stood above the casing of that size, but the Register has calculated the flow at 75 gallons per inch per minute, which is believed to be accurate. When confined in an additional joint of casing it stood 12 feet 4 inches above the ground.

"The manner in which Elza White and his crew of workmen have done this work calls attention to the fact that they have attained most satisfactory results with the Keystone driller. They work day and night, having two shifts, and usually finish a well in four, five or six days. The machine is powerful and is equipped with heavy drills that go through anything."

R. S. Hamilton Well, Roswell, New Mexico; drilled with the Keystone Machine 349 Feet in Ten Days by Elza White.

The water in these wells is found in a layer of sand and gravel from 200 to 600 feet below the surface. As soon as the pipe is driven into this stratum the water rises. A number of wells have been put in, and, with only a few exceptions, they all flow. This water is believed to come from the melting snow on the mountains and percolates through the porous gravel until it finds a vent. The gravel is overlaid with a blanket of blue clay and putty-like alluvium. What is being done along the Pecos and Hondo rivers can be done in many other parts of New Mexico and western Texas, as well as other parts.

In making these wells, it is essential that the piping be carefully put in in such a way that the flow of water will be conducted to the surface. Unless this is done, the water may rise a certain distance and flow away through open crevices or dry strata of sand without appearing at the surface at all. These wells now being made in eastern New Mexico are being used not only for watering stock, but for irrigation, and form one of the cheapest known methods for getting water for this purpose. The amount of water to be obtained seems to be limited only to the number of holes put down, and wells have been put down within a few hundred feet of each other without seeming to lessen the amount of water discharged.

THE 700th anniversary of the first mining operations in Germany will be duly celebrated this month in the Hartz mountains, where silver and copper have been steadily mined since 1200. The Emperor will grace the occasion with his presence. The event is of note as illustrating the permanence of the metal mining industry. The celebration will be at Hettstedt in Saxony, where the first mine is said to have been opened.

Partial Programme of the International Mining Congress at Paris.

The following is a partial programme of the International Congress of Mining and Metallurgy, which meets in Paris in connection with the Exposition, June 18 to 23, as furnished by the General Secretary of the Congress, M. Griener, 55 Rue de Chateaudun, Paris, France:

MINING.

1. "Use of Explosives in Mines," by M. Delaford, Inspector-General of Mines, France; M. Denoel, mining engineer, Belgium; M. V. Watteyne, director of mines for the Ministry of Industry of Belgium; M. H. Le Chatelier, professor at the College of France.

2. Use of Electricity in Mines.—Reports by M. Wendeling, chief engineer for Siemens & Halske, Berlin; and M. J. Lebert, chief engineer of the mines of Namur, in Belgium.

3. Conditions of Mine Working at Great Depths.—Reports by M. Hrabak of Germany; M. Stassard, of Mons, Belgium; M. Poussigne, director of the coal mines of Rosschamp. Also M. Petit, chief engineer of the Compagnie des Houllieres de St. Etienne, France, a paper on the working of the thirteenth level at the Villiers shaft.

4. Means for Reducing the Manual Labor Required in Mines.—"Substitution of Machines for Hand Labor in the Mines of the United States," by M. Bachellerie; "Tests of Machine Drills in France," by M. Paul Fayol, director of the mines of Brassac; "Mine Drills in the United States," by M. Chodzko, mining engineer, San Francisco, Cal.

5. Mechanical Preparation of Coal for Market.—Report by M. Buisson, director of the mines of Commentry, France.

6. Studies on the Development of the Mineral Industry and on Statistical Questions.—"The Mineral Production of the United States, and the Production of Gold in the World," by R. P. Rothwell; "The Iron Ores of South Russia," by M. Syzmanowski; "Uniformity in Mineral and Metallurgical Statistics," by M. de Dittmar, chief of the Statistical Bureau of the Miners' Association of south Russia.

METALLURGY.

1. Progress in the Metallurgy of Iron and Steel Since 1889.—"The Present Condition of the Manufacture of Thomas (basic) Steel, and its Effect on Wrought Iron Manufacture," by M. Rocour, manager of the Forges et Acienes du Nord et del Pest, France; "The Manufacture of Special Steels," by M. Babu, professor at the School of Mines, St. Etienne, France; "Phenomena Accompanying the Deformation of Metals," by M. Hartmann, Puteaux, France; "Direct Utilization of Blast Furnace Gases," by M. Hubert, Liege, Belgium; "Present Condition of the Manufacture of Steel," by M. Tissot, chief engineer of the Societe des Aciers Robert.

2. Applications of Electricity to Metallurgy.—"Aluminum at a Low Price," by M. Heroult, engineer of the Societe Electro-Metallurgique of Froges, France; "Magnetic Separation of Ores and Minerals," by Dr. H. Wedding of Berlin, Germany; "The Wetherill Process of Separation," by M. Sneits of Dusseldorf, Germany.

3. Progress in the Metallurgy of Gold.—"The Cyanidation of Gold-Bearing Ores in the Transvaal," by M. Bousquet.

MINING SUMMARY.

ARIZONA.

COCHISE COUNTY.

W. H. McKittrick and Ryan Bros. have bonded a group in Turquois, making a preliminary $10,000 payment. The mine is regarded as a copper property.

GILA COUNTY.

Globe Times: Supt. Calder of the Pinto Creek M. & M. Co. says that work on the tunnel on the Yo Tambien mine is being carried forward.

MOJAVE COUNTY.

Near Chloride, at the Elkhart mine, E. Hilty has been engaged as foreman; work will shortly be resumed. F. W. Theis is manager.

On the Schuylkill mine, south of the Elkhart, work begins upon the arrival of machinery.

The new steam plant at the Silver Age mine has been up and running for several days past, and both day and night shifts are at work in the mine. The ore body now being sunk upon is of good size and quality; and when the 200-foot point is reached, crosscuts north and south will be commenced and prosecuted a distance of 200 feet both ways, when the work of stoping will be inaugurated. This mine joins the Connor-Minnesota on the north and the Silver Knight and Johnny Bull mines on the south, and the fine and high-grade quality of the ore now coming out has caused arrangements to be made to open up and work the two latter.

The Mollie Gibson, owned by H. L. Frank of Butte, Mont., is still idle.

The turquoise mine of Braun & Coolidge, near the Colorado river, has been bonded to J. C. Stewart of Denver for $12,000.

Rich silver ore is reported in the Little Wallapai mountains, 20 miles southeast of Kingman, by T. Tyrell. C. Metcalf of Kingman is putting up money for development.

The Yucca Cyanide M. & M. Co. has decided to close down its work at the San Francisco mine for the present. The owners are said to have disagreed.

PIMA COUNTY.

Dr. Lennox tells the Tucson Star that the Helvetia mines are producing 110 tons of ore daily. The strike in the Isle Royal on the 180-foot level continues to grow. The crosscut shows the ore body 24 feet wide, averaging 15% copper.

J. A. Copeland at the Mammoth mine is in charge of the improvements, which include twenty additional stamps to the 50-stamp mill.

PINAL COUNTY.

(Special Correspondence).—The El Pinal Consolidated Silver and Lead mine in this county is 18 miles from Florence. It has been idle for several years. It has recently been purchased by W. H. Norway of Santa Barbara, Cal., together with the Lena and Martinez, the latter carrying copper. The new owner will resume operations. The property is 45 miles from the S. P. R. R. At Casa Grande a branch road is projected to the Bay mine. This will bring this property within 6 miles of the railroad. This is one of the mines that in recent years would not pay with the depreciation of silver, but with better facilities can be worked at a profit.

Florence, Ariz., June 5.

The main shaft on the Mammoth mine is being sunk to a depth of 1000 feet.

C. Meyers has sold his copper property, 25 miles from Casa Grande, to H. L. House of Denver.

CALIFORNIA.

AMADOR COUNTY.

The Sargent mine, south of Jackson, is to be developed.

At Volcano, Supt. Dickerman will sink the shaft of the Altaite mine 150 feet deeper.

The Central Eureka at Sutter Creek is to have a 20-stamp instead of a 10-stamp mill.

Supt. Joyce of the Defender mine, Volcano, is in San Francisco. He projects a new 10-stamp mill.

At the Bunker Hill mine, near Amador City, the water has been lowered 500 feet, and the shaft is retimbered.

Work in the tunnel at the Butte Mountain mine has stopped.

At the Newton copper mine, between Jackson and Ione, the smelter will begin July 15th.

In the Amador Queen No. 2 mine the shaft is 1235 feet. Crosscuts west will be run at the 800 and 1200 foot levels.

CALAVERAS COUNTY.

Near West Point the Lone Star Co. will sink the shaft to a depth of 500 feet below the bed of the Mokelumne river.

The Lockwood mine is unwatered, and sinking has begun.

In the French Hill tunnel at Mokelumne Hill, Burton & Co. have struck sulphuret ore 18 feet in width.

HUMBOLDT COUNTY.

Trinity river is falling and promises to go lower by September than it has done in many years. Then there is likely to be a good deal of bar mining until the winter rise comes.

KERN COUNTY.

Bakersfield reports that E. M. Roberts has sold 120 acres of land adjoining the Kern river oil district for $48,000.

Bakersfield Californian: The California Standard has all its tanks full; 1450 barrels on hand. The oil is between 20 and 21 gravity; a car is filled in thirty-one minutes.——The Hercules Oil & Producing Co. of Los Angeles is reported to stand ready to put in a $30,000 refinery here if a suitable site is donated. The products to be turned out, if the enterprise is established, are asphaltum, paints, lubricants and gas engine distillates.

MARIPOSA COUNTY.

The Barcroft mine at Hornitos is reported sold for $13,000.

C. S. Baxter, who piloted a party of mining men from New York in a special car with their Supt., T. P. Bisland, interested in the Nameless mine, 5 miles from Coulterville, says that the company will spend half a million dollars in development work. "The Merced river will be dammed, an electric plant put in and the company will erect a 40-stamp mill."

Mariposan: The Mariposa C. & M. Co., at the Mariposa, has the vein at the 275-foot level and a ledge 2½ feet thick is being followed.——At the Princeton the shaft is down 630 feet. At 750 feet a station will be cut. The 10-stamp mill will be running next month.——At the Josephine the shaft is down 275 feet below the tunnel. A station will be cut at 300 feet and drifts run. ——The shaft at the Pine Tree is below the tunnel 350 feet. A station will be cut and drifts run at 400 feet.

MONO COUNTY.

Bridgeport Chronicle-Union: S. G. Lines of Antelope Valley is at Benton, and has arranged to open the copper property, consisting of forty claims, near Benton.

NEVADA COUNTY.

Union: Supt. Dulmaine has fifteen men employed at the Golden Treasure, developing the property.

ORANGE COUNTY.

At Santa Ana it is estimated that $300,000 has been invested within the county this year in oil development. A small stratum of oil is reported struck in the first well of the Orange County Oil Co., indicating that the oil formation continues south.

PLACER COUNTY.

The Michigan Bluff M. Co.'s tunnel is in 660 feet; about 150 feet more reaches the channel next month. The main tunnel cut through an old upraise with figures showing that work had been abandoned on it in 1860.

At a recent Boston meeting of stockholders of the Pioneer G. M. Co., the management voted on 53,000 shares; the opposition voted on 12,000 shares—a total of 65,000 out of the whole capital of 100,000 shares.

The majority vote authorized the directors to incur an indebtedness for the development of the property; to mortgage the property to secure the indebtedness; to dispose of the property at public or private sale, and to form a new company and to exchange the shares of the old company for shares in the new company upon a basis to be decided upon by the directors.

Colfax Sentinel: In the Hidden Treasure mine at Centerville, the main tunnel is in 8500 feet. The company have been breasting the channel to the width of 600 feet. They will extend No. 5 gangway, crosscutting the channel 1100 feet; thence north up the channel 1000 feet, in order to work a portion of the upper lead where the main tunnel is too high to work it. A room has been cut in the cement 20x30x12 feet, on the right of the main tunnel at a point 5000 feet in. Here an electric hoist and pump is used to develop the blue channel 32 feet lower. A drift of 350 feet has been run on the channel, and crosscuts are being made which have developed 150 feet width of channel. Supt. Akers reports 175 men on the payroll. Twenty trains drawn by an electric motor bring out 350 cars daily. The Hidden Treasure drift mine is operated upon the most extensive scale of any drift mine in the State. The mine is paying regular dividends and never looked better.——Work will be resumed at the Pioneer quartz mine, near Towle.——R. Jones, Supt. Canada Hill mine, is working twenty men. A tunnel 900 feet in length has struck gravel.——D. Lovelace, in Humbug canyon, below Red Point, will erect a 5-stamp mill.——The Bald Mountain gravel mine is being worked through a shaft. Number of men employed, 15; W. H. Bell, Supt.——Over $200,000 has been spent on the Big Channel, Rough & Ready and Peckham Hill gravel mines in an effort to discover the outlet of the deep channel on the lower Forest Hill divide. The tunnels were all too high. It is believed that the tunnel now started in Snyder canyon at an elevation of 2100 feet will be low enough to tap the channel.

PLUMAS COUNTY.

Work on the Little Onion Valley quartz mine has been resumed under the management of Plumas Turner.

Mining operations are to be resumed at the Red Slide and in a gravel mine at the head of Poormans creek.

SAN BERNARDINO COUNTY.

(Special Correspondence.)—The Bagdad mine, 7 miles south of here, is preparing for development. Buildings are being constructed and a 25 H. P. gasoline engine is in place. The assay value of the pay ore body in shaft and levels is said to be considerable. Porphyry constitutes the country rock in the vicinity. C. Grant is resident superintendent.

Ludlow, June 12.

SAN DIEGO COUNTY.

The reduction works at National City were burned last Sunday evening. Recently S. H. Lucas established a cyanide plant at the works and operated it with power from the engine room. With this exception, the plant had been idle for several years.

D. C. Collier Jr., at Julian, is trying to effect a consolidation of the Kentuck S. and Cincinnati Belle mines. They are adjoining properties; a tunnel driven into the Kentuck S. unwatered both mines and it would be economical to work the two together. The tunnel is 938 feet long. The Kentuck S. shaft will have to be sunk 190 feet to meet the tunnel, and the Belle shaft 225 feet.

SHASTA COUNTY.

(Special Correspondence.)—It is reported that ochre ore assaying $700 per ton has been met with in a raise in the Summit mine, 7 miles north of here. The extent is not known so far, but good-sized kidneys of similar ore have been extracted from the same mine. The country rock is tough diabase. The Marina Marsicano M. Co. are the owners.

Ono, June 13.

The Spread Eagle copper claims are bonded at $125,000 by C. D. Galvin to the Scottish-American Development Co.—a payment of $62,500 to be made before July 1, 1901, the remaining $62,500 on or before July 1, 1902, and the further consideration of 20% of the capital stock of the company.

SIERRA COUNTY.

P. M. Keefe has a bond on the Saddle Buttes mine, above Sierra City.

In the Alaska mine, Pike City, Supt. Dunlap will tap the old shaft with a tunnel. The 20-stamp mill will start crushing ore.

SISKIYOU COUNTY.

The dredger at Hawkinsville, Yreka creek, has started up. It is claimed that it will move 3000 cubic yards of gravel every twenty-four hours.

The O. & C. mine, about 4 miles from Hornbrook, bonded and leased by C. W. Tyrer & Son, is in ore 30 inches wide, showing free gold.

The new town of Carman has been located near the Dewey mine; a smelter is projected. The ore runs $15 per ton. The company is shipping to the smelter at Keswick; working fifty men.

TEHAMA COUNTY.

The directors of the Tehama County Oil Co. have let a contract to sink a well 1200 feet.

TRINITY COUNTY.

(Special Correspondence).—Owing to the destruction of the Lewiston bridge and the deep fords of the Trinity river, the rotary gravel mill, to be operated here by G. E. Bailey, will not be ready to run till about June 25th.

Lewiston, June 9.

A large pumping engine is to be put in by the Altoona Q. M. Co.

The Trinity G. P. M. Co. has incorporated; W. Maitland, D. J. Noyes, G. W. Baker, H. L. Baker, F. Nettlefold, F. G. Steuart, M. W. C. Wemyss; capital stock, $50,000.

TUOLUMNE COUNTY.

Supt. Roberts this week starts work on the Little Wonder, near Carters. Supt. Graham has begun work on the McKinley mine, in the same locality. The Slap Jack, near Groveland, will resume about July 1. J. Hamilton of Sonora has taken charge of the Hazel Dell mine. Near Groveland, A. Zeets, at the Rhode Island, is putting up a 52-foot gallows-frame; an 85 H. P. boiler will be put in.

Near Jamestown the Harvard mine has its new 60-stamp mill in operation. The ore is hoisted at No. 2 shaft, run to a rock-breaker over a 600-foot tramway; the crushers are operated by a 75 H. P. electric motor; the stamps weigh 1100 pounds each. Six plates 3x6 feet and two splash plates 6x36 inches are used to each battery, all of copper, plated with two ounces silver per square foot. Power for the mill is supplied by two independent 75 H. P. motors, set in line with the back of the batteries, and at each end of the mill; a smaller 30 H. P. motor operates the concentrators. The electric power, from the Tuolumne County Water Co.'s plant above Phœnix lake, is delivered at 15,000 volts, three-phase, to two transformers, which in turn deliver the current at 440 volts, two-phase, at 8000 alternations per minute.

COLORADO.

BOULDER COUNTY.

Near Gold Hill the Prussian mine shaft has been sunk through a 200-foot cap of spar. When the cap was broken through an ore streak 3 feet wide was found, going from ten to twenty ounces gold.

The Cash mine is being unwatered.

The Slide mine is shipping. The mine is worked altogether by leasers, twenty-five or thirty men finding employment.

CLEAR CREEK COUNTY.

The new mill at the Stanley mine is to have 100 tons daily capacity.

W. E. Renshaw at Idaho Springs is leasing and bonding the Mattie mine.

FREMONT COUNTY.

The new $500,000 chlorination mill of the U. G. Ex. Co. at Florence will be in operation Sept. 15th. Present capacity 400 tons, maximum capacity 600 tons.

HINSDALE COUNTY.

Manager Farrell of the Lellie mine, near Lake City, will erect a mill and install machinery, the mill to have a capacity of sixty tons daily.

At the Czar mine, at Capital City, T. Tonge has three tunnels started.

LAKE COUNTY.

(Special Correspondence.)—The Home M. Co. will soon have its new hoist ready for operating, when the Penrose shaft will be sunk 100 feet deeper. It is not believed that the proposition to consolidate the Home Co. with the New Leadville Co. will be acceptable. The properties of the latter company are up California gulch, near the Yak tunnel, and comprise five claims, making about sixty acres.

The Adams, Maid & Wolfe Tone lease, in charge of S. D. Nicholson, will soon be in position to produce a large tonnage through the Wolfe Tone shaft. The underground workings of the three named are all connected and a connection with the Mab can be made with little difficulty. The latter is opened through a shaft about 1800 feet southeast of the Wolfe Tone shaft and is also under Mr. Nicholson's management. The new gallows-frame over the Wolfe Tone shaft is constructed of redwood and stands 82 feet above the ground and 60 feet above the ore landing. The main timbers are 16x16 inches and are put up without any mortising, being held together by heavy iron bolts. The shaft is three compartment and well timbered. Within the last thirty days the water in the shaft has been lowered 200 feet by a triple expansion pump set at the 750-foot station. This pump handles 1000 gallons per minute, has 20-inch high pressure, 30-inch intermediate and 44-inch low pressure cylinders, with 36-inch stroke. Later on, when the shaft has been sunk to the 1300-foot level, a second pump will be set at that station. A first-motion hoist, having 20x42-inch drums, has been ordered and will soon be in place. At present an old-style hoist answers the purpose. Seven boilers of 100 H. P. each supply steam for the necessary power.

In sinking on this group of mines from the surface to the 1300-foot level four distinct contacts have been pierced. The first was a carbonate ledge at about 660 feet depth; the second, at about 720 feet depth, was composed of a lead-zinc sulphide; the third, at 970 feet, was an iron sulphide; the fourth, at 1200 to 1300 feet, is a clean iron sulphide with some copper. By this it will be readily seen the Maid of Erin, Wolfe Tone and Adams have been producers of ores having a diversity of grade and character. The leasing company now in control, and which has put a large sum of money into new equipment, expect to reap their reward, in the main, from the great sulphide stratum, comprising the fourth contact.

The Silver Cord M. & L. Co., under the management of W. L. Cooper, are shipping fifty tons per day from the Silver Cord mine on Iron hill. Within thirty days the tonnage is expected to reach 150 tons per day. The present tonnage comes from the 400-foot level. The shaft cuts through two contacts, the first being an oxidized silver, lead and iron ore, the second a silver, lead and zinc sulphide ledge. A 247-foot upraise is being made from the Yak tunnel to the Silver Cord grounds at a point 600 feet south of the Silver Cord incline.

The Yak tunnel has advanced about 9000 feet from its entrance in California gulch to a point under the summit of Breece hill. About seventy tons of ore

per day are shipped through this tunnel.

The Morning Star Con. group, comprising some sixteen shafts on Carbonate hill, maintains a shipment of about 100 tons per day of manganese ore and iron fluxes, all produced by lessees under the general directions of the company.

The Arthur lease on the Catalpa is shipping about twenty-five tons per day of iron oxides from the 500-foot shaft.

The Yankee Doodle mine, on Carbonate, is being operated by the Leadville M. Co., lessees, who are making small shipments. They are running a new level at 400 feet depth. The ores carry iron, silver and manganese.

The Modoc, on Carbonate, is reported as shipping fifty tons per day of manganese ore.

The Ruby mine, on Iron hill, operated by the Ruby Leasing Co., or Maxwell, Horrigan & Goodwill, have shipped a considerable tonnage from the carbonate contact, at about 500 feet depth, comprising lead carbonates, sulphides and some horn silver. They are now sinking 80 feet lower to cut the second contact, wherein they expect to find the same rich body of lead sulphides as was found in the Louisville, several hundred feet to the north.

The Louisville is reported to be preparing to install a hoist at the head of the incline, 645 feet below the surface, to enable them to operate a skip to handle a quantity of iron ore on the lower levels.

The Mike & Star, on the southwestern slope of Breece, is operated by the Buena-vista Smelting Co., who are shipping therefrom about forty tons per day of iron sulphide ores.

The Stevens shaft of the Iron-Silver M. Co., on the south side of California gulch, has been unwatered and a new 100 H. P. boiler and air compressor are being put in. The old hoist is in good condition and will be used. The shaft, now 560 feet deep, will be sunk deeper and other development prosecuted.

Of the 2700 tons of ore per day sent to the smelters from Leadville district only about 300 tons belong strictly to the class of lead carbonates, which originally made the camp famous.

The Resurrection is the heaviest producer of lead oxides, while the Ibex is the principal producer of siliceous and sulphide ores. The Leadville gold ores come mainly from the Breece and Little Ellen hill section. The iron and zinc-lead sulphides comprise the larger proportion of the camp's tonnage.

The Nil Desperandum, on Rock hill, has opened a ledge of manganese ore, with some silver values.

The Nisi Prius, on same hill, is doing a good deal of work and shipping a small tonnage of lead and iron oxides. They are sinking a new shaft.

On the south part of Rock hill are the Revenue shafts, and farther to the northwest, near the Union smelter, is the Valentine, being developed by Maj. Bohn and associates. Their work is of a prospecting nature, to determine as to the continuity of the carbonate ore shoots of the downtown mines southwesterly through Rock hill.

About 150 tons per day of siliceous, sulphide ore are being shipped from Sugar Loaf mountain, which lies just west of town, beyond the Arkansas valley. The shipping mines there are the Gunnison, Red Hook, Dinero, President, Black Iron and Tiger.

The Ballard, on Breece, is shipping thirty tons per day from the 450-foot level. The ores are a dry siliceous material, running well in gold.

The Ibex is shipping about 200 tons per day, all of which is being hoisted from shafts Nos. 2, 3 and 4, which are 700, 900 and 1100 feet deep, respectively. From fifteen to eighteen air drills are being operated. The upper levels of the Ibex produce an iron oxide, carrying gold, much of which is free, and good values in silver and some copper. These oxides also carry a small percentage of lead in places. In the sulphide ledge, at greater depth, the values, consisting of gold and copper, are found in a clean iron sulphide.

At the Sedalia the 700-foot shaft is being sunk deeper. When the 790-foot depth shall be reached, a station will be cut at that point to enable them to drift into the body of lead-carbonate and gold ore, which Manager Bartholomew is certain exists at that level, as a ledge of this character has been mined on the same level on the Resurrection, which adjoins the Sedalia. The workings in Resurrection, Sedalia and Fortune are connected.

The magnitude of leasing operations in Leadville are perhaps not fully appreciated. The great majority of the properties of the district are operated by individual lessees and leasing companies. Among the larger operations of this character are the Home group, Midas, Adams, Maid & Wolfe Tone, R. A. M., Mab, A. Y. & Minnie, Penn group, President, Big Six, Small Hopes, Midland, Silver Cord, Humboldt, Seneca Reserve, Valentine, Chippewa, as well as small leases which reach into hundreds. The term of the average Leadville lease is such as to warrant the lessee in thoroughly preparing for business. There are cases wherein leases run ten years and there are few which run less than three years. This, however, does not apply to the system adopted on a few properties where the owner company takes charge and lets specified blocks of ground to persons on the tribute plan, the company furnishing all material and doing the hoisting and hauling. Where the long-time lease is taken, the lessee furnishes everything required, and, as in such cases as the A. M. & W., often spends thousands of dollars for machinery. The royalties paid by lessees, of course, vary considerably, but in most cases they are doubtless between 5% and 25%.

The Ibex, Greenback, Dolly B., Diamond, Fortune, Iron-Silver, Louisville, Sixth Street and Welden are the principal mines whose operations are managed by the owners direct. WASCOTT.

Leadville, June 2.

Post: At Leadville bismuth ore is still coming out of the Ballard, but the production is by no means as large as it might be. There is a ring of English and German speculators who control the market, and it is to their advantage to keep the production at a minimum. They have the absolute control of both the sources of production and the agencies of consumption, and should a rival start in the business they are prepared to freeze him out. Leadville could, probably, produce enough bismuth to supply the world.

Leadville is daily shipping 300 tons zinc to Europe via Galveston, Texas. The Maid and Henrietta mines have contracts with foreign zinc firms for large quantities.

TELLER COUNTY.

The Tenderfoot Hill Con. M. Co. will spend $50,000 in development work, and has let a contract for 400 feet of sinking on the Altamont group. A similar amount will be spent on the Deadwood group.

The Gazette reports bromide of silver in the Santa Rita mine in the granite formation, half a mile away from the eruptive rock. At a depth of 500 feet the ore runs eighty-five ounces gold and 200 ounces silver, smelter returns.

The management of Stratton's Independence have asked for rates on a production of 4000 tons a month for four years. During May the Independence sent 150 tons of mill ore daily to the plants of the Colorado-Philadelphia Co., averaging $30 a ton.

The Detroit mill of Independence has started. The ore is run through a set of rolls that reduce it to a third mesh, sampled and dried, then goes to a second set of rolls, where it is reduced to eight mesh. Thence it goes through a third set of rolls that grind it to thirty mesh, after which it goes through a pulverizer. During its journey through the pulverizer a dry chemical is mixed with the ore, and it leaves the pulverizer ground to 100 mesh and finer. There is no roasting. After leaving the pulverizer the pulp is sent down into the first four vats. The solution in the vats is at boiling point and in them the ore is prepared for the second set of vats. In the first set of vats the ore, in solution, is agitated for two hours, after which it goes to the second set and is treated for an hour. In this set of vats mercury is introduced. After leaving the second set of vats the pulp goes into settling tanks, thence over concentrating tables, a mechanical system of amalgamation. The pulp, after leaving the pulverizer, all passes through an iron cylinder 10 feet in diameter.

Victor Record: The Union Co. has decided to do its own work hereafter, O'Malley & Co.'s contract being the last to expire. Most of the upper ore measures have been exhausted, so it has been decided to explore greater depths.——Manager Frankenberg of the Modoc has shipped a car of ore that contained twenty-five tons, valued at $1000 per ton. It went to Pueblo, effectually guarded by workmen and officers.

IDAHO.

ADA COUNTY.

Boise World: The final negotiation in connection with the deal for the Atlanta group has been made. There are five claims. The purchasers have, aside from the purchase price, money for development and equipment. This will include the erection of a stamp mill and a cyanide plant. The Idaho Midland has agreed to build a spur 7 miles long to the property.

SHOSHONE COUNTY.

The Alice group, Ready gulch, near Wallace, has been bonded by Finch & Campbell of Spokane for $50,000.

WASHINGTON COUNTY.

Gold dredging on the Snake is active. Last week, 12 miles above where the Boise empties into the Snake, a new dredger was put in. The sand is brought from the bar to the dredger by buckets on a chain, and there dumped into the sluices after passing over a set of grizzlies. The sluice is horseshoe-shaped, extending completely around the inside of the boat. At intervals along the sluice are slides on which the water is so diverted as to deposit the black sand and finer gold, while the coarse material is caught as ordinarily. At the back end of the boat is an old-time Spanish arrastra, and into this is scraped the material collected upon the slides. The arrastra is similar to those in the early days, excepting that a larger quantity of quicksilver is used.

MONTANA.

BEAVERHEAD COUNTY.

The Gold Dredge M. Co. has 3 miles of placer ground on Grasshopper creek, near Bannack. L. C. Bonney, manager, and M. McDonald, superintendent, to a Standard reporter say they have two boats, costing about $50,000 each, working about a mile apart, one operated by water and electricity, the other by steam. Each boat is 102 feet by 36 feet; the machinery on each weighs 300 tons. The booms from which the dredge buckets or scoops work have a sweep of about 300 feet, the width of the paystreak along the creek. The grade is 1%. A small dam is sufficient to hold water in check to float the boats and they make their own channel and construct their own dam. Each boat handles 2100 cubic yards of earth a day; the pay averages 25 cents a yard. It costs $200 a day to run the dredges.

DEER LODGE COUNTY.

Toole & Twohy have contracts aggregating $250,000 for work in connection with the erection of the new smelting plant southeast of Anaconda, one for the excavation for and construction of the foundation walls of the new works; about 100,000 yards of earth and rock will be excavated for the foundation; the walls aggregate about 25,000 cubic yards stone. The other contract is for about ten miles railway track for the new works, connecting with the B., A. & P.

MADISON COUNTY.

W. Dickinson is Supt. German Bar M. Co., near Laurin.

Work at the Pole Creek placers, near Red Bluff, has been suspended temporarily, says the Pony Sentinel. This was not due to any fault of the mines, but owing to the inexperience of B. Ryan, who was sent out there from Toronto, Canada, to manage them. Mr. Tanner negotiated a deal for the sale of the Pole Creek placers several months ago, the purchase price being $80,000. The Toronto man, Bernard Ryan, a son of one of the capitalists, was sent out there to operate the mines, and with the usual success of inexperienced men he made a failure of it. The company expended $20,000 in preliminary work. They have 2000 inches of water with two hydraulic giants and a fall of 260 feet. A. W. Tanner will resume work on the properties.

SILVER BOW COUNTY.

At the annual meeting of the stockholders of the Parrot Silver & Copper Co., in Butte, General Manager Gallway submitted the following report to the stockholders for the year ending April 30, 1900:

ASSETS.

Permanent investment	$ 732,168 56
Mine property	891,978 63
Bridgeport Copper Co. stock	498,500 00
Treasury stock	1,500 00
New works investment	721,050 75
Copper and silver on hand at Bridgeport	13,381 88
Cash	8,030 90
Bridgeport Copper Co	71,268 98
C. D. Burrage, treasurer	651,747 20
Sundry accounts receivable	168,407 64
Supplies on hand at Butte	9,524 00
Total	$3,767,558 54

LIABILITIES.

Capital stock	$2,300,000 00
Sundry accounts payable	63,323 52
Surplus	1,404,235 02
Total	$3,767,558 54
Surplus May 1, 1899	1,898,964 47
Net gains to April 30, 1900	884,370 55
Total	$2,783,335 02
Dividends paid year ending April 30, 1900	$1,379,100 00
Surplus April 30, 1900	$1,404,235 02

The Montana Ore Purchasing Co. has put 250 men to work on the Pennsylvania vein.

Geo. Robertson, Supt. Park Canyon M. Co., has begun work on the Homestake mine.

A Butte dispatch of the 13th inst. says: During Miners' Union Day exercises letters were read from W. A. Clark and F. A. Heinze, granting the miners in their employ their request for an eight-hour working day. In his letter Senator Clark says: "I realize the hazardous character of labor in the mines, and that it increases with depth of the working by reason of difficulty of ventilation and other reasons. I am satisfied that the demand for shortening the time for a day's work to eight hours in all underground workings is not an unreasonable one, and I have given instructions to the superintendents of all my mines to adopt the eight-hour system, beginning the 15th inst." The Heinze letter says: "It is undoubtedly a fact that no occupation is more hazardous than that of the underground miner. He assumes more risks than other laborers, and the accidents to which he is subjected are most disastrous. The profits of those engaged in mining have greatly increased in the last few years through the rise in the price of copper, but the underground miner has had no share in this prosperity. On and after to-day, the anniversary of the Butte Miners' Union, the miners in the employ of all mines in which I have a controlling voice shall receive the present scale of wages for a day's work of eight hours."

NEVADA.

ELKO COUNTY.

Salt Lake hears that the negotiations for the sale of the Dexter and Tuscarora companies, Nevada properties, are going on—the Dexter at $3 per share, or $600,000, and the Tuscarora at $250,000.

LINCOLN COUNTY.

F. Sizer of Butte has made a report on the April Fool mine of De Lamar. Six tunnels have been run in on the vein, the lowest one being known as No. 6, which is in some 3000 feet. From this tunnel a shaft has been sunk and two levels cut upon it, drifting both ways on the vein. The ore in these levels averages from one to one and one-half ounces in gold, and a large body has been blocked out.

On hearing of the recent fire at DeLamar, Capt. DeLamar cabled from Paris to his agent at DeLamar to see that every one who had lost by the fire was relieved and that there must be no suffering allowed. Work was also furnished to every one in the camp that desired it.

LYON COUNTY.

C. T. McHenry of Butte, Mont., is at Yerington, to develop the Bluestone copper location. He represents the Excelsior M. Co. of Butte.

STOREY COUNTY.

The Crown Point M. Co. will sell the hoisting and other machinery, the works to be dismantled, underground work in that mine to be prosecuted through the Yellow Jacket and Belcher shafts.

WASHOE COUNTY.

Work has begun on the Red Cloud mine, 20 miles north of Reno, where native quicksilver has been found.

WHITE PINE COUNTY.

The Ely M. & M. Co. at Ely has decided to give $10,000 for three claims adjoining their properties—the Florida, Dauntless and Quadrant claims, owned by D. E. McDonald of Ely.

Tribune: Experts are examining the Paul copper properties at West Camp in the interest of Senator Clark of Montana.

NEW MEXICO.

SANTA FE COUNTY.

T. J. McLaughlin, Supt. Santa Fe G. & C. Co. at San Pedro, has decided to make the new smelter, which this company is now building at San Pedro, of 250 tons daily capacity, and the machinery is designed to treat ores 2½% copper at a profit.

Mayo is erecting a 100-ton chlorination mill to treat the gold-copper ores on the Cullen group.

Supt. Woodworth is putting a 20-stamp mill on the Tuerto, west of Golden.

SOUTH DAKOTA.

CUSTER COUNTY.

At the Crown Hill mine, Supt. Young has begun running the new 50-ton concentrating plant at the Spokane mine, 6 miles south of Keystone. The ore is galena; concentrates 60% lead, 30% silver; value, $60 per ton. The ore is concentrated, sacked and shipped to smelter at Omaha.

At Custer, the New York mica mine is considered the largest mica proposition in the United States. The mica bearing ledge is about 800 feet long and 50 feet wide, being a vertical formation. The mine may be sold to the Chicago Mica Co.

The second payment on the 365 acres of mining ground in the Ragged Top district by the Spearfish M. Co. was made last week. The price of the property includes the 25-ton cyanide plant. The company expects to begin work on a 100-ton cyanide plant.

UTAH.

BEAVER COUNTY.

The Imperial Copper M. Co. of Frisco, is opening the mine at three points, working double shifts on each, finding ore in the three places.

JUAB COUNTY.

The Eureka Hill has resumed and sixty

of the 100 stamps are dropping. The mill is in charge of J. J. Pilgerrim. Supt. Watson has enough ore blocked out in the mine to feed the mill.

The Eureka Miner says there seems little prospect that stamps will be added to the Bullion-Beck mill in the near future. The company has about 15,000 tons of milling ore on the dump, which is being added to daily. The metallic contents are about 2% copper, 10% lead and 12 ounces silver, and with fair smelting charges the lot could be shipped at a profit.

SALT LAKE COUNTY.

Zinc-lead ore is reported in the Winnamuck mine, Bingham. J. Campbell tells the Tribune it assays 21% zinc, 17% lead, 15 ounces silver and $1 gold. He sent 500 pounds of ore to Denver; the test was made there on a Cammett concentrating table, making a separation of the zinc from the lead; the lead product assayed 48% lead, 9% zinc and 15 ounces silver; the zinc product 26% zinc, 2% lead and 3 ounces silver. The concentration was three to one. Both products carry 14% iron.

At a recent meeting of Utah lead producers in Salt Lake City, reported by the Tribune, J. L. Bamberger said that a few of the Western lead producers in Utah, Idaho and Montana had united some time ago, and by their combined effort had been able to maintain the price of lead for about three months in the neighborhood of $4.57½ per hundred. The cause of the recent slump in price was the refusal of the Missouri lead producers to share any portion of the burden, while they were unloading all the lead they could mine at the price which was being maintained by the Western producers. He stated that there was about 250,000 tons of lead produced in the United States every year. All of this product is consumed in this country, except about 10% of the total, or 25,000 tons per annum, which accumulates as a surplus. The smelting companies have to hold this surplus or export it at a loss when lead is $4.25 per hundred or over. To take care of this surplus it was proposed that each lead producer contribute so much per ton for the metallic lead contained in their ores, to be used for the purpose of protecting the loss on the 10% surplus above mentioned, which must be exported; when lead reaches $4.25 per 100 lbs. the amount contributed by the lead miners to be $1 per ton; when lead goes to $4.50 per 100 lbs. the contribution to be $2 per ton, and when it reaches $4.65 per 100 pounds or more, then the assessment to be $3 per ton for metallic lead produced by each mine, the smelter people to have nothing to do with the management of the business, the lead producers to form a national organization and direct its affairs, the only part the smelters to have in the transaction being to retain the schedule assessment out of each lot of silver-lead ore and pay it over to the proper officers of the Lead Producers' Association, this to be in accordance with a properly executed authorization by each member of the association. He stated that the difference in a beneficial way to the Utah lead producers would amount to from $50,000 to $60,000 per month, while the expense to the mine owner would be very light; only a few cents per 100 pounds on the lead produced, and that the maintenance of the price of metallic lead would not affect the price of white lead, that had remained the same regardless of the price of metallic lead during the past year or more.

On the 5th inst. local lead producers made a provisionary compact agreeing to the plan outlined above.

Meanwhile in some instances lead producers are storing their high-grade lead ores in the stopes and drifts until such time as the market will afford a profitable margin.

SUMMIT COUNTY.

Park Record: J. B. Fleming, foreman Silver King mill, will draw up specifications for the new Silver King sampler that is to be erected as soon as possible.

Following are the shipments of ore from the Mackintosh sampler for the past week:

	Pounds.
Silver King	1,085,000
Daly West	949,000
Anchor Con	342,000
Ontario	190,000
Apex	79,000
Valeo	31,000
Loring Bros.	35,000
Total	2,711,000

WASHINGTON.

KITTITAS COUNTY.

Supt. Boggs at Blewett is reported to have "invented a new cyanide process, and turning out a gold brick valued at from $1000 to $1500 every two weeks from the tailings of the stamp mill."

The Peshastin M. Co. has struck its objective lead.

At Liberty there is considerable activity in placer mining, little in rock work. Mr. Engle is the principal owner of placer ground there. The placer gold of Liberty is coarse, while the gravel is largely slate.

SNOHOMISH COUNTY.

The Wilbur mine, Index district, has been leased to T. McIntyre, vice-president and foreman of the company. He is working ten men.

STEVENS COUNTY.

The Eagle mine at Chewelah has resumed ore shipments.

FOREIGN.

AUSTRALIA.

London Mining Journal: The returns of the output of gold in the five great producing colonies for the March quarter of this year compare with those for the corresponding period as follows:

	March quarter, 1899. Crude ounces.	March quarter, 1900. Crude ounces.
Victoria	184,898	173,813
West Australia	316,753	387,617
Queensland	205,542	226,112
New South Wales	100,153	85,283
New Zealand	92,718	95,479
Totals	900,064	968,304

The increase of 68,240 ounces is entirely accounted for by West Australia, whose increase is 70,864 ounces for the quarter, Victoria having decreased 11,085 ounces.

The Mines Department of South Australia has prepared a statement of the quantity and value of minerals produced and exported from that colony during the past four years. The following figures are of general interest: In 1896 exports were valued at £237,857, and this has risen to £451,611 in 1899. The smallest gold export for the period mentioned was in 1898, when 2798 ounces, valued at £10,676, left the colony. The largest gold export for the period was in 1897, when £39,020 worth was sent outward.

BRITISH COLUMBIA.

At Sandon the Slocan Star mine is partly closed down. B. N. White, general manager, from Minneapolis gave instructions to shut the mill down and cut the force in the mine to forty men. He then left for White Horse Rapids district in Alaska. The Slocan Star mine was employing 108 men.

The Emily Edith group near Silverton is to be taken over by an English company for $275,000. The nominal capital of the new company has been placed at $375,000. J. D. Kendall, on whose report the deal is made, says: "The contour of the ground in regard to the veins is such that the latter can be readily reached by tunnels for a long time to come. The strata are soft and cheaply worked, wages are as usual in the West, timber is abundant and ample water can be obtained for both dressing and power purposes."

At Rossland the Le Roi M. Co. is calling for tenders for a third forty-drill compressor. There is now in use one forty-drill and one twelve-drill compressor and the second forty-drill machine is being installed.

In the Slocan the force on the Last Chance has been increased to seventy-five men, and a car of ore a day is being sent down the hill. The long tunnel to get the depth on the property is being driven. New buildings, when finished, will give accommodation for 150 men.

Supt. Graham of the Waterloo mine, from Camp McKinney, has a gold brick weighing 106 ounces, the result of twenty-two days' mill run for May, valued at $1480.

In the Ainsworth district the Stevenson Tunnel Co. has a water power and compressor of its own, but finds it cheaper to buy the power. The prices charged are $3 per day for each drill, $4 for pumps (No. 6 or less), and $4 for small hoists. Other mines buying this power are the Tariff, No. 1 and Star.

In the Slocan there are 100 men at work on the Payne mine. A new power drill has been put in. At the Whitewater the force is also about 100 men.

Following are the shipments from the Rossland mines for 1900 to June 1:

	Tons.
Le Roi	35,962
War Eagle	10,603
Center Star	7,617.5
Iron Mask	1,434.5
Evening Star	356
Monte Christo	273
I. X. L.	266
Iron Colt	50
Giant	42
Total	56,004

At the Le Roi 600 tons of ore a day is being extracted from the stopes. It is the intention to go down to the 1000-foot mark as soon as the shaft is completed to the 900 level. Preparations are under way to put an aerial tramway to the Black Bear flat.

A machine drill run by air direct from a column of water is being operated by Supt. Knowles at the Philadelphia mine at Ainsworth. The compressor consists of an upright pipe at the side of a hill, giving a fall of 107 feet. Under this a shaft has been sunk about 2000 feet, so that the full drop is over 300 feet. The water, in dropping, carries with it air. From the bottom of the shaft the water escapes into a vessel, where the air rises to the top and the water escapes from under it to the surface. The body of water from the vessel to the surface gives a pressure of about eight pounds to the inch to the air, which escapes to the pipes from the top of the tank. Mr. Knowles says: "The drill is 12,000 feet from the compressor, which is on Coffee creek. It is started without a hitch and with eighty-five pounds air pressure at the drill. This pressure is maintained at all times."

MEXICO.

Two Republics: H. M. Diffenback, manager Monterey smelter, controlled by the Guggenheim interest, has returned from Juarez, in Chihuahua, where he had been in consultation with Willard S. Morse, general manager of the Guggenheim interests, relative to the starting up of the Juarez smelter owned by the company, and says: "It is probable the Juarez smelter will resume operations. It closed down because the supply of lead ore from the company's mines ran short. But last month the output of the mines was 6000 tons of ore carrying an abundance of lead. We believe this output can be very materially increased and our expert is now examining the mines to report on them. While it is very likely our present plans will be carried into execution, still the matter has not been definitely settled. We are planning to add to the Juarez plant two copper matte furnaces of twenty tons daily capacity each. There is a great deal of copper ore being found in northern Mexico and a considerable quantity of it is being shipped through El Paso to Denver for treatment. We want two furnaces to handle this ore."

SOUTH AFRICA.

A special correspondent of the London Daily Mail writes that a journey along the Rand is a depressing experience. Everywhere is a strange silence, now that the thud of the battery stamps and the clatter of the hauling gear are stilled. The tailing heaps lie white as skeletons upon the track, and the gaunt headgears point bony fingers to the sky. The Golconda has become a Golgotha, in which rust and curruption are the only active agencies and decay alone is king. At long intervals a listless chimney floats a smoky pennant to the sky as a sign that there a privileged engineer is fighting the canker with his pumps. But the number of these is small and wholly inadequate to dispel the general impression of a charnel house. Wagon ways, deserted by their supports, hang fantastically festooned or draggle sluttishly across the heaps of ore. In the shafts the water has reached its level, and is noiselessly, remorselessly picking out the pit supports and obliterating the existence of crosscuts.

While such is the scene presented to the passing observer, to the mining expert little damage of a permanent character reveals itself.

The mines have been gathered into four groups:

1. The mines seized by the Government and worked by its officials.

2. Mines in which work was never stopped or was early resumed by the proprietorial companies.

3. Mines in which operations have ceased, but which have received permission to pump

4. Mines in which work has ceased and which have been refused permission to pump.

1. The mines worked by the Government are the Robinson, Bonanza, Ferreira Deep, Rose Deep and Crown Reef. All are in full working order except the Rose Deep. The Robinson is treating concentrates as well as crushing ore.

To take the place of the board of directors the Government has appointed a special commission to superintend operations. This consists of the four State officials, Messrs. Klynhaus, Munnik, Minnaar and Van Alphen, and the Uitlanders, Messrs. Wagner, Boucher and Gordon. The monthly returns, approximating as they do those obtained before the war, seem to show that these gentlemen have successfully withstood the temptation to work out only the best ore, and have taken it in its legitimate order.

Thirty per cent of the gross production of these five mines is, by law, forfeit to the Government, although the right has not been exercised.

2. Seven mines are still worked by the proprietorial companies—Ferreira, Wemmer, Village Main Reef, Worcester, Pioneer, Geldenhuis Estate and Langlaagte Deep.

The gold obtained from these mines is delivered in its entirety to the State mint, from which a receipt is obtained for the total amount, less the cost of labor advanced in money. Thirty per cent of the gross output is forfeit to the Government under the conditions already detailed.

Many mines which would have been found in this group have been prevented by the fact that their cost of production, exceeding 60%, has proved prohibitive.

To superintend operations, each of these working companies has a quorum of directors on the spot.

The Geldenhuis Estate, being short of natives, is unable to work full time, and is on the brink of shutting down.

The Langlaagte Deep, although included among the working mines, is merely engaged crushing some eighty heaps of accumulated ore and in pumping operations.

3. Thirty-one mines have received permission from the Government to pump, although actual mining has ceased. Twenty-six of these are accounted French or German mines, and have received the privilege as a compliment to their nationality. At least one-half of the total shares of a company must be in the hands of Continental investors to qualify for this concession.

The mines designated "French mines" are: Champ d'Or, French Rand, Durban Roodepoort Deep, Main Reef Consolidated, Pearl Central, Langlaagte Estate, Jumpers, Jumpers Deep, Crown Deep, Wolhuter, Henry Nourse, Treasury, New Kleinfontein, New Modderfontein and Van Ryn.

The German mines consist of: West Rand York, Lancaster West, Princess Estate, Roodepoort Central Deep, Roodepoort United, Durban Roodepoort, Meyer and Charlton, New Goch and May Consolidated.

In addition to these, five English companies have received permission to pump, since inundation of their properties would endanger neighboring mines at work for the mint.

These are: Salisbury, Jubilee, City and Suburban, New Primrose and Glencairn.

Of these mines, only a few are endeavoring to pump dry. The majority are content to confine the water to the deeper workings and to prevent its reaching the upper or oxidized zone, where crumbling is most to be feared.

Engineers are divided in their opinion as to the economy of pumping. Some hold that it will prove cheaper to exhaust at a single operation than to maintain continuous pumping; others that the cost of repair of shafts, galleries and inclines in a flooded mine will far exceed the expense of persistent pumping. One engineer says that to pump 600 feet cost him $10,000 per month and he did not consider the expenditure justified. Many mines are flooded to within 250 feet of the surface, all trucks, railways and movable plant having been hauled above water level.

It is evident that the only person competent to decide the vital question whether to pump or not to pump is he who knows every detail of the workings of the mine. He must know the friability of the upper or oxidized zone, where subsidences are more probable than in the pyritic zone; the condition of the shafts, inclines and crosscuts; and the dependence to be placed upon the woodwork and the pit props. In the majority of cases the man best able to judge is absent, and in many permission to pump has not been granted because none remained to apply for it.

The great advantage of possessing this permission is the opportunity it gives of maintaining on the spot a staff of competent men who can keep machinery bright, execute repairs and preserve the surface plant in fair working order. That privilege many sanguine managers wilfully threw away, remarking that, for the length of time they would be absent, it was not worth while making application. There are cases in which no attempt was made to leave affairs in decent order, the men throwing down their picks and drills where they stood, and abandoning the wagons with their last loads still upon them. Political precipitancy had overcome professional discretion.

SOUTH AMERICA.

From a subscriber comes the following: It is generally believed that the Guyanas, South America, are rich in gold. Such, however, is not the case. It is the old saying, "distance lends enchantment, etc.," also these far away sections afford to the man with a shoestring a better opportunity of getting in his work. Gold is found in both quartz and alluvial wash. The veins of quartz are small, and of blanket nature, and wherever uncovered and free from soil, are broken up and disin-

tegrated. From this part of the veins is derived their alluvial gravel, as they call it, which is nothing but a bed of disintegrated quartz.

The whole surface of most of these sections, or countries, for say 200 miles from the coast, is overlaid with a superficial formation, which is composed of clays, sands, gravel and boulders, principally clays. The alluvial gold-bearing wash is very shallow, from 6 to 36 inches, and clay bed. This runs on an average about $2.50 per cubic yard. The gold is very light and flakey and you save by best native methods 40%. This loss is due to several causes which cannot be overcome, first the fineness and light character of the gold, and second, the excess of clays. Most of the companies operating on a large scale that have undertaken by improved mechanical devices to discount the native saving, are still in a query. The quartz veins average probably $8. Both the quartz veins and alluvial wash contain pockets of exceptionally rich values, but these are rare instances.

The climate is not the best; it rains continuously, and before and after showers it is very hot. Malaria caused from the unhealthy exhalations from the wet lands and bad air produces fevers, agues, etc., to which every one is more or less subject. The nights are not bad and one could sleep if permitted by the mosquitos, of which there are several well developed species.

Living is very expensive; common hotel fare in Demerara (English country) is $2.50 per day. This is simply a sleeping and eating price. Then once each week or oftener you must "give up" to all the help that the proprietor rings in on you. So really you never know what it has cost you. You only know you are broke. I have figured how to beat this game, so the readers will save money by following my advice; it is simple: "Buy the hotel." In Dutch Guyana the rate is $2 per day—you help yourself to nothing. The most satisfactory way to exist here is to get a place of your own. To do this and live will cost at least $100 per month. French Guyana is not worth considering. There is no money to be made out of mines in any of these countries, and to come under contract nothing less than $500 per month (U. S. gold) is worthy of entertaining, and then only on short terms.

THE KLONDIKE.

The Dawson Daily News, copies of which came out by the latest Dawson mails, places the estimate for the season's clean-up on the Klondike at $18,553,270. There are a total of 560 dumps that are calculated to show an average of 10 cents to the pan. Over 5000 men are employed on the various creeks. Of the creeks, El Dorado leads with an output placed at $3,746,200.

The steamer A. F. Gustin left Dawson June 4th for St. Michael, carrying $2,000,000 in gold dust. She is expected to connect with the Zealandia at St. Michael for San Francisco.

FOLLOWING is a synopsis of the programme of the International Mining Congress to be held at Milwaukee, Wis., June 19th–23d: Tuesday, June 19th, 2 P. M.—Opening of convention in Exposition building; call to order; prayer by D. T. Denman; opening address by president; address by Gov. Scofield; address by Mayor Rose; response; address of president.

June 20th, 10 A. M.–2 P. M.—Permanent organization; appointment of committees. Papers to be read—Department of Mining, L. B. Prince, Santa Fe, New Mexico; Public Survey of Mineral Lands, P. Clagstone, Stehekin, Wash.; Lead and Zinc Industry in Missouri, E. M. Shepard, Springfield, Mo.; Progress and Development of Mining in Western Ontario, T. R. Deacon, Rat Portage, Ontario.

June 21st, 10 A. M.—Papers—Mining in the East, J. W. Postgate, New York; Mines and Minerals of Southern Wisconsin, R. Kennedy, Highland, Wis.; Revision of Mining Laws, C. J. Moore, Cripple Creek, Colo.; Why Women Should Interest Themselves in Mining, Mrs. E. C. Attwood, Empire, Colo.

June 23d, 10 A. M.—Papers—Treatment of Ores, L. D. Godshall, Spokane, Wash.; Mining, Mine Managers and Inspectors of Mines, H. J. Brennan, Carbondale, Pa.; election of officers; closing.

Personal.

M. HODGE is now Supt. Princess Maud mine, Republic, Wash.

R. CURTIS SR. has been appointed foreman Union mine, Nevada Co., Cal.

E. E. CHASE, E. M., Denver, Colo., recently spent some time at Kelly, N. M.

JNO. A. CHURCH of New York City is inspecting California mining property.

J. L. GRIMES is now Supt. Bellevue Con. Co., Bellevue mine, Placer Co., Cal.

DAVID KEITH has resigned as manager of the Anchor M. Co., Park City, Utah.

O. P. POSEY, of the Cochiti, N. M., G. M. Co., has gone to Boston, thence to London.

T. H. OXNAM leaves California on the 18th inst. for Paris, to be absent till Nov. 1st.

J. A. SNEDAKER of Denver, Colo., returned last week from a trip through central Nevada.

WM. MAGENAU is now connected with the cyanide plant of the Dexter G. M. Co., Tuscarora, Nev.

W. C. POTTER is appointed as special California mining representative of the Santa Fe Ry. Co.

EDWARD R. POOL has opened a sales agency for the American Steel & Wire Co. in Denver, Colo.

H. A. COHEN is inspecting Capt. De Lamar's California properties in San Bernardino and Shasta counties.

G. W. HULL AND E. D. TREADWELL have returned to Jerome, Arizona, the former from Boston, Mass., and the latter from California.

A. E. LINDROOTH, Denver representative of the Link-Belt Machinery Co., recently returned to Denver from Arizona and New Mexico.

J. N. BISSELL, general agent Mexico Mine & Smelter Supply Co. at Oaxaca, Mexico, has returned to that city from a visit to the capital.

GEORGE KISLINGBURY of Shasta, Cal., has gone to Idaho to examine mine property for J. R. DeLamar, returning thence to Baker county, Or.

W. A. KNAPP, Supt. Bellwether mine, Amador Co., Cal., is at La Grange, Mariposa Co., removing a mill and hoist to the Amador Co. property.

H. A. COHEN will probably be the general manager of the Consolidated Golden Gate & Mercur, Utah, mines. The new arrangement goes into effect July 1.

F. F. SHARPLESS goes from Dalton, Madera county, Cal., to West Chester, Penn., thence returns to California, from whence he goes to southeastern Alaska.

WARREN C. BOGUE, general manager Utah branch of the Mine & Smelter Supply Co. of Denver, Colo., has returned to Salt Lake City from Summit county, Utah.

L. C. BONNEY, general manager G. D. M. Co., Bannack, Montana, goes in August to Venezuela, S. A., where his company has concessions of placer ground to work by dredger.

MISS CAROLINE VAN BRUNT is secretary Oxford Copper Co., 99 John St., New York City, and takes personal charge of the metallurgical laboratory. Colorado, Utah, California and Arizona each furnish women mine superintendents, and in California are two young women who conduct assay offices.

W. L. WATTS, California State Mine Examiner, is at work in San Diego and Los Angeles counties; W. H. Storms, Assistant State Mine Examiner, is this week in Tuolumne Co., and goes thence to Sierra Co. S. M. Bowers is in Plumas Co.; F. M. Anderson has been assigned Shasta, Siskiyou and Trinity counties.

F. M. JOHNSON, Gen. Mgr. Albemarle, N. M., mill is in San Francisco. He plans a new 350-ton mill for the Star mine. In connection with this mill it is locally stated in the latter part of '99 the Navajo people sent notices to seven mine machinery manufacturers, inviting bids on material for their 350-ton mill. Six out of the seven firms replied that they had orders on hand that would occupy their attention for twelve months, and declined to make bids. One Chicago company agreed to take the contract for September delivery if paid a premium of $3000 on the contract price, or would forfeit $3000 if they failed. About June 1 they notified the manager that their rush orders were so far behind that they could not supply the machinery, and would pay the forfeit of $3000. The company hopes to place its contract, so that the new mill machinery may be got on the ground by the close of the century.

Catalogues Received.

No. 41 of the series issued by the M. C. Bullock Mfg. Co. of Chicago, Ill., treats of the Bravo hand-power diamond drill. The M. C. Bullock Co. style it "The Prospector's Friend." The catalogue illustrates and describes this hand-power diamond drill and will be sent to any one asking for it.

Commercial Paragraphs.

THE Dillon Iron Works, Denver, Colo., are enlarging their shop facilities.

C. S. BURT has opened an office in Denver, Colo., for the Bethlehem Steel Co., of South Bethlehem, Pa.

G. E. WOODBURY, of San Francisco, is in Colorado, where his new pattern concentrator is being introduced.

J. S. J. LALLIE has removed his surveying instrument establishment to the Arapahoe Building, Denver, Colo.

THE Risdon Iron Works of San Francisco is placing its new rolling mills in continuous operation to furnish structural steel and iron.

THE E. P. Allis Co., Milwaukee, Wis., has the contract for the new 100-ton cyanide plant at the Camp Bird mine, Ouray, Colo.

THE Sonora R. R. Co., has published an illustrated pamphlet descriptive of the country and industries along its line from Nogales to Guaymas, in Sonora, Mexico.

THE Griffin Wheel Co., of Chicago, have a plant and a branch office at Denver, Colo. Vice-president Wales, of this company, is at present in San Francisco.

THE Weigele Pipe Works, at Denver, Colo., have filled orders for about 26,000 feet of pipe for water power and placer work and have orders for six weeks work ahead.

THE Geo. E. Dow Pumping Engine Co. succeeds the Dow Steam Pump Works, 108–120 Beale St., San Francisco, with enlarged quarters and improved facilities for the manufacture of mine pumps.

THE Union Iron Works of San Francisco has bought 275 feet square, corner Second and Folsom streets, San Francisco, to establish thereon an auxiliary plant for the manufacture of mining machinery.

THE Board of Supervisors of Trinity county, Cal., want bids for furnishing the county with 5-inch pipe, No. 18 iron, 3500 feet in length; also separate bids for 5-inch (casing) pipe (dipped), 3500 feet in length; bids to be in by July 10, 1900.

THE trusts are proving a good thing for the Burt Manufacturing Co., Akron, Ohio. Among their recent shipments are Cross oil filters for the Carnegie Steel Co., American Steel Hoop Co., the American Sheet Steel Co., and their fourteenth order for the American Tin Plate Co.

F. W. BRAUN & CO., of Los Angeles, Cal., write that with the Cary burner and combination furnace it is possible to melt and cupel 144 assays in twelve hours with five gallons of gasoline. One burner operates both compartments simultaneously. They furnish catalogues giving particulars for assayers.

BAILY & MONNIG, managers of the State Ore Sampling Co., who are buyers of the rare metals, state that tungsten, brought to that market, comes mainly from near Silverton, Colo.; that uranium, in yellow oxide form, comes from the Paradox valley, Colo., the black sulphide from Gilpin county. They get considerable bismuth from Leadville.

W. H. EMANUEL, Denver, Colo., reports the following recent sales of machinery: A seven-drill Rand cross-compound steam and air compressor to the Independence Town & M. Co., at Independence, Cripple Creek district; also a 1,500,000-gallon Worthington compound packed-plunger pump to the city of Grand Junction, Colo.; and several Rand air drills of different sizes to mines in Colorado and New Mexico; also two 80 H. P. tubular boilers, with 6x4x6 Worthington boilor-feed pumps to the Gold King M. & M. Co., at Silverton, Colo.

THE Colorado Iron Works have orders in hand for the following equipment: A 200-ton copper smelter for H. H. Hoffman, Sonora, Mexico; 48 U-pipe hot-blast stove for smelter in Tennessee; a 36x51-inch silver-lead smelting furnace for Mexico; a 200-ton copper smelting plant, with Bretherton's patent hot-blast appliances, for the Kendrick & Gelder smelter at Silverton, Colo.; six double-bowl slag trucks for the Arkansas Valley smelter at Leadville; a 40-stamp crushing mill for J. H. Terry, at Silverton, Colo.; one set 42x6-inch high-speed rolls for British Columbia; a 5-stamp gold-milling plant for the B. O. B. M. & M. Co., in New Mexico; also a 5-stamp wet-crushing mill and appliances for the Lucky Strike G. M. Co., at Gunnison, Colo.

THE Daniel Best Manufacturing Co., San Leandro, Cal., has word of the arrival of the six steel freight wagons for use on the Trans-Siberian railway. The Best Manufacturing Co. meet with marked success in the manufacture of traction engines. Those thus supplied are each of 50 H. P., and will have a load of from thirty to fifty tons. The upright boilers are of 4 feet diameter, tested to 200 pounds, and have 48 square feet heating surface. To the boilers are attached wrought-iron bed plates 1x6 inches, forming the main frames of all the machinery. To these are attached twin engines 9-inch bore and 9-inch stroke, geared to the main inner cogged periphery of two large drive wheels. The height of the main drive wheels is 8 feet; the total weight of each is 13½ tons. The engines can be used stationary to furnish power at any point desired. The water tank is of 500 gallons capacity; coal, oil or wood may be used as fuel.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING JUNE 5, 1900.

650,889.—SWATH CLEANER—H. A. Abrott, Sunol, Cal.
651,289.—WATER COCK—J. P. Benton, Dalles, Or.
651,101.—WATER WHEEL BUCKET—F. R. Brown, Unga, Alaska.
651,104.—ENVELOPE—W. H. L. Corran, S. F.
651,006.—CONCENTRATOR—S. T. Curtis, Virginia, Nev.
651,106.—LADDER—I. M. Dillman, Oakland, Cal.
651,009.—WEATHER STRIP—B. Erlandson, S. F.
651,327.—WAVE MOTOR—V. Gifford, Los Angeles, Cal.
650,941.—BICYCLE SADDLE POST—H. J. Kramer, Los Angeles, Cal.

651,002.—GAS GENERATOR—G. C. Wood, Applegate, Cal.
32,795.—DESIGN—J. Simonds, Berkeley, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CARBURETORS.—No. 651,017. June 5, 1900. A. L. Navone, Calistoga, Cal. This invention is designed to generate explosive vapor from suitable hydrocarbon liquids, and to mix the same with air in appropriate proportions. It comprises a generator having a heating pipe, an exterior case surrounding and supported upon the pipe, a spiral channel coiled and fitting around the pipe, with means for supplying a hydrocarbon liquid to the upper end and withdrawing the residue below. Means are also provided for supplying air to be mixed with the vapor as produced, with an adjusting device for regulating or cutting off the supply of air to be mixed with the vapor.

RUG SEWING MACHINE.—No. 650,990. June 5, 1900. Oliver Rice, Oakland, Cal. This invention relates to a machine which is especially designed for the manufacture of rugs. It consists in a novel mechanism by which the loops of the yarn are formed and engaged by a thread carried by a reciprocating needle so that each loop is given a proper height, and is tied or fastened by the thread of the needle. The machine comprises a transversely channeled table, a frame with rollers adapted to carry and transfer the rug base, a bar movable and guided in the table channel with oppositely toothed racks and mechanism whereby the rug carrier may be transferred alternately from one side to the other. A second bar is secured on top of the first named bar and separated from the latter to provide a space for the passage of the rug base and having vertically disposed comb teeth projecting from its front. A plate is adapted to strip

the loops of the comb plates after a row of loops has been completed. The fabric is then returned across the machine and a second row of loops is in like manner formed. A vertically pivoted hook is adapted to engage the yarn, this hook lying between spurs upon the front of a transversely movable and guided carriage, and this hook withdraws the yarn to form a loop. A vertically movable thread-carrying needle is reciprocated in unison with the movements of the looper and its thread is thus engaged with the yarn loop which at the same time is drawn down upon one of the comb plates and is tied or fastened by the thread so as to make the loops which form the surface of the rug uniform in length and appearance.

AUTOMATIC WEATHER STRIP FOR DOORS.—No. 651,009. June 5, 1900. B. Erlandson, San Francisco, Cal. This invention comprises a sealing strip adapted to close against the seal or surface below the door or window, a lever by which the strip is carried, and mechanism by which it is automatically actuated to depress the strip and make a tight joint when the door is closed and allowed to rise clear of its seat when the door is opened. It comprises a sealing strip, bars upon which it is carried movable within the channel in the lower part of the door, a centrally fulcrumed lever from one end of which said bars are secured, a contact plate by which the outer end of the lever is raised and a sealing strip depressed when the door is closed. A spring is located within the carrier and presses upon the top of the outer end of the lever whereby it is tilted and the sealing strip raised as soon as the door begins to open. There is an exterior casing with adjusting and locking screw whereby the carrier and connected parts are raised or depressed and locked in place.

CONCENTRATOR.—No. 651,006. June 5, 1900. S. T. Curtis, Virginia City, Nev. This invention relates to an apparatus which is designed for the concentration of valuable sulphurets and other heavy materials. It comprises a table, means by which it is freely suspended at a point between its ends and substantially balanced, means whereby the balance and the table are regulated, horizontal guides for the upper end of the table, and means for reciprocating the latter longitudinally. One end of the table is supported upon horizontal slidable bars, and an elastic concussion head is fitted against which the head of the table is caused to strike when reciprocated. Means are provided by which the table is reciprocated longitudinally, and a floor consisting of separate steps so disposed as to form broad approximately horizontal surfaces. These steps are cut backwardly to form recesses in which the material settles, and a receiving box or trough connects with the lower end of the table into which box the discharge is received. In conjunction with these features is a subdivided trough carried by the lower end of the table with means for discharging the material reaching that point upon opposite sides of the partition of the trough, fixed arms projecting into the trough so as to agitate and loosen the material and there are discharge pipes upon the bottom; an overflow from the outer edge of the trough and a screen by which said overflow is received, with passages by which the material received thereon is delivered from either side. There is a fixed apron upon which the material which passes through the screen is received, and a chute delivering said material on a vertically journaled pan, with means by which the pan is oscillated about its shaft. A central discharge pipe and stationary fingers projecting into the pan agitate the contents.

Recently Declared Mining Dividends.

Elkton Consolidated M. & M. Co., Colorado, 3 cents per share, $75,000	June 20
Last Dollar G. M. Co., Colorado, 2 cents per share, $30,000	July 5

WANTED.

A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.

Address: **EDWARD N. BREITUNG,**
MARQUETTE, MICH.

Latest Market Reports.

SAN FRANCISCO, June 14, 1900.

SILVER—Per oz., Troy: London, 27¾d (standard ounce, 925 fine); New York, bar silver, 60c (1000 fine); San Francisco, 60½c; Mexican dollars, 49½c.

COPPER.—New York: Lake, 1 to 3 casks, 16.50 cash; carload lots, 16.25; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.25; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $3.87½; Salt Lake City, 3.85; St. Louis, $3.75; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7, sheet 8, bar 6c. London, £17 5s = 3.75c per lb.

SPELTER.—New York, $4.45; St. Louis, $4.55; San Francisco, ton lots, 5¾c; 100-lb lots, 6c.

ANTIMONY.—New York, 10c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, pig, No. 2, foundry, $20.90; gray forge, $18.25; San Francisco, bar, per lb., 3c.

STEEL.—Billets, Pittsburg, $27.50; sheet bars, $31.50; San Francisco, bar, 11c to 18c per lb.

QUICKSILVER.—New York, $51.00; London, £9 10s; San Francisco, local, $49.50 ℔ flask of 76½ lbs.; Export, $47.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

MAGNESIUM.—New York, $3.00 ℔ lb.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17c.

BABBITT METAL.—San Francisco, No. 1, 10c.

TIN.—New York, pig, $30.00; San Francisco, ton lots, 31½c; 1000 lbs., 32c; 500 lbs., 33c; less, 34c; bar tin, ℔ lb, 37c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

BISMUTH.—New York, ℔ lb., $1.70 50-lb lots; San Francisco, $2.50 to $2.75 lb lots.

NICKEL.—New York, 50@60c ℔ lb.

TUNGSTEN.—New York, ℔ lb., $1; San Francisco, $1.25.

FERRO-TUNGSTEN.—New York, 37%, 40c; San Francisco, 75c (60%).

FERRO-MANGANESE.—Pittsburg, 80%, $125.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ℔ set; 14 oz., 40s., 10½c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 33@35c ℔ lb.; carloads, 31@32c; in 10-lb. tins, 40c; sulphuric acid, 66° B, 2c ℔ lb.; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.: chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

PHOSPHORUS.—F. o. b. New York or Philadelphia, 45@50c ℔ lb.

COAL.—San Francisco coast, yard prices: Wellington, $8; Seattle, $6.00; Coos Bay, $5.50; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $9; Cannel, $11.00; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

SITUATIONS WANTED.

WANTED—SITUATION AS MANAGER OF producing or developing property. Twelve years' experience in gold mining and milling, copper mining and smelting. Address C. H., care of Mining and Scientific Press.

MINE SUPERINTENDENT, TEN YEARS' experience in Michigan, Montana and Idaho, desires engagement as Supt. or manager of developing or producing property in this country or abroad. Best of reference. Address D. C., care this office

POSITION WANTED TO MANAGE A MINE and mill. Years of experience. Thoroughly practical, pushing and energetic. Handle men with skill and economy. First class testimonials as to integrity, etc. Address SKILL, this office.

SITUATION WANTED BY EXPERIENCED ore dresser and millman. Licensed steam engineer. Familiar with both continuous and alternating current apparatus. Mexico only. Address SIZING, care this office.

WANTED.

WANTED.—Two 5-Foot Huntington Mills.
Must be in perfect condition. Address, giving prices and full particulars, A. B., care Mining and Scientific Press, San Francisco.

RICH DRIFT MINE
IN PLACER COUNTY.
Wanted, parties with capital to purchase an interest in a large rich gold mine, or to work on percentage. Address H. H., Mining and Scientific Press.

WANTED,
A Developed Copper Property.
A specialty made of developed properties in Mexico and the Southwest. Good mines and prospects are wanted. Bona fide correspondence of mine owners, capitalists and investors solicited.
H. B. RUNKLE, Mining Broker, El Paso, Texas.

REFRACTORY ORES WANTED.
1000 TONS or more which will assay $75 00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.
C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

BENJAMIN T. LLOYD,
STOCKS, BONDS AND MINES.
Have immediate customers for well-developed Gold and Copper Properties.

Quicksilver
For Sale in Lots to Suit.
REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

ALVIN PHILLIPS & CO.,
Chemists, Mining and Metallurgical Engineers,
1761 MARKET STREET,
DENVER, - COLO.
Complete Ore-Testing Works — capacity ten pounds to two tons. Modern Methods of Lixiviation, Cyanide and Chlorination. Concentration on Bartlett Table. Assaying and Bullion Refining. Chemical Analyses of Oils, Coal, Water, and all solutions. WRITE FOR PRICES.

Quicksilver
——FOR SALE BY——
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - - 320 SANSOME STREET,
SAN FRANCISCO.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.
A. M. DONALDSON & CO.,
ASSAYERS AND WASTE PRODUCT SMELTERS,
1661 Larimer St., Denver, Colo.
Write for Donaldson's Assayers' Slag Hammer.

FOR SALE.

For Sale---One 26 H. P. Hercules Gas Engine.
In first-class order. For particulars, apply by mail to JERRY J. SULLIVAN, Supt. Pioneer Gold Mining Company, Towle, Placer Co., Cal.

Group of Gold and Silver Mines for Sale.
For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery. For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

FOR SALE.
A Development Interest in a Large, Low-Grade Quarry Proposition.
Conditions favorable for working cheaply and for water power. Near good road, not far from town. Address L. M., care of Mining and Scientific Press

Hydraulic Pipe FOR SALE.
1500 feet 11-inch Casing weighing 27 lbs. to the foot, with Flanges, or Screws and Sockets; in lots to suit. Correspondence solicited.
C. J. TALLON,
308 Market Street, San Francisco, Cal.

FOR SALE.
ENGINES:
8 h. p. N. Y. Safety; 6x10 Rice Horizontal; 10x16 Hendie & Meyer; and others.
THE S. H. SUPPLY CO.
WRITE FOR CATALOGUE OF MINING MACHINERY AND SUPPLIES.
22nd and Larimer Sts., DENVER, COLO.

A Large Hydraulic Mining Property For Sale,
Comprising 274 acres and having water rights, ditches, reservoirs, etc. Ground has averaged for thousands of cubic yards of gravel over 22 cents per cubic yard. The property is offered for sale on favorable terms, for the closing of partnership affairs, and in consequence of the death of principal owners. There are no complications; U. S. patents for title. Facilities for restraining dams good; U. S. Debris Commission rights for dams granted. Every facility given for thorough investigation. For further particulars apply to ALMARIN B. PAUL, Agent for Eastern owners, 27 Crocker Building, San Francisco.

FOR SALE.
The following Machinery:
150 H. P. Compound Ball Engine, 12-inch and 20-inch Cylinder, 18-inch Stroke, complete with Fly Wheels, Steam Pipes, Shafting, etc.
150 H. P. Heine Boiler.
7 H. P. Gasoline Hoist.
Burleigh Steam Power Duplex Air Compressor, 15-inch Steam Cylinder and 14-inch Air Cylinder, 18-inch Stroke.
Triplex Knowles Pump, operated by Electric Motor, 6½ inch Plungers, 7-inch Stroke.
8 Electric Motors and Generators, 500 volts, from 10 to 75 H. P.
5000 feet 12-pound T Rails.
For further particulars and prices, apply to
R. W. Smith,
OROVILLE, - - CALIFORNIA.

QUARTZ MILL
FOR SALE.
10-Stamp Quartz Mill.
1 Rock Breaker.
2 Ore Feeders.
1 Engine.
2 Water Wheels.
4 Frue Vanners.
6 Canvas Tables.
1 Boiler.
1 Endless Chain.
1 Electrical Plant.
Belts, Pipe, Pulleys and Bolts in profusion.
Mill been used but little. Situated on Dog creek, by wagon road six miles from Delta station, Shasta county, on California & Oregon branch of Southern Pacific Railroad. Will sell at a sacrifice, as owner has no use for it.

A BORE HOLE

is the cheapest, quickest, most direct, and most effective way to test lands for minerals, oil, gas, salt, sulphur, borax, water, etc.

THE STAR DRILLING MACHINES

excel for these uses. They will drill a hole through anything to any depth from 250 to 2500 feet. The only machines made that are absolutely without annoying springs. They are simple, powerful and efficient. Easy to handle at work or on the road. Used in every State and Territory and in many foreign countries.

We also make full line of drill tool-bits, reamers, sand pumps, spuds, etc., etc. Write for illustrated free catalogue.

Ever Know an Engine Has Lungs?

The cylinder of an engine corresponds with lung action and in some ways is afflicted with lung trouble. For instance, too much moisture in the steam cylinder will cause more trouble than a damp atmosphere to a consumptive.

Vertical. Sizes 1½ to 12 in.

AUSTIN Separators

Horizontal. Sizes 1½ to 12 in.

Are the proper medicine. They eliminate all moisture and ensure the greatest efficiency to the engine. Shipped on 30 days' trial to responsible parties anywhere in the United States and freight paid both ways if not satisfactory.

SMOOTH-ON CASTINGS.

TRADE MARK

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

Patented Dec. 5, 1899; May 29, 1900.

THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

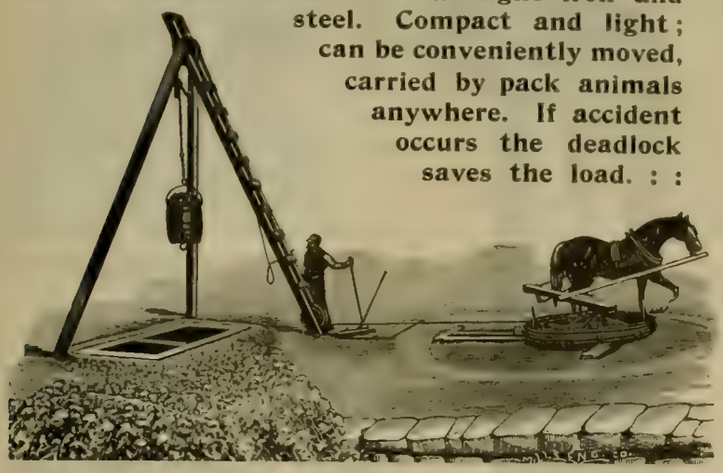
CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.



Estimates made for complete Steam Freighting Outfits. Address

WEIGHT, ONLY TEN POUNDS.

—AND THE—
PNEUMATIC SEPARATOR.
Weight, 160 lbs.; capacity, 15 to 30 tons per day.

These machines save the gold WITHOUT THE USE OF WATER, enabling the miner to thoroughly prospect on the spot and successfully work the rich benches and gulches, when water is not convenient. The separation is accomplished by graduated air current. These machines are especially adapted for saving flour and beach gold. No quicksilver being used, the iron-coated beach gold of Cape Nome, so difficult to amalgamate, is saved with these machines as easily as though the gold was clean. Send for descriptive circulars.

A MODERN COPPER SMELTER

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

THE LITTLE ALASKA GOLD WASHER.
Price $6. Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time*, *labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

Up-to-date Miners who value their lives use McINTYRE'S DRY BATTERY PORTABLE ELECTRIC SAFETY LAMP.

NO. 2 LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored, where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.
If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.
If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and, holding it in the position shown, take your readings in less time than you can place any other instrument. Send for descriptive catalogue B to

No. 044 BUTTON BALANCE. Sensibility 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

CATALOGUE ON APPLICATION.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupelling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

ASSESSMENT NOTICES.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1900, an assessment of seventeen and one-half (17½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of May, 1900, an assessment (No. 25) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 21st day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of May, 1900, an assessment (No. 3) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 310 Pine street, room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of July, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—310 Pine street, rooms 36, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1900, an assessment (No. 12) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of July, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 1st day of August, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

THE LUNKENHEIMER Regrinding Swing Check Valve

Is much superior in point of excellence of material, design and workmanship to any other valve of its class upon the market. The body is heavy and well proportioned, the seat is carefully finished and the workmanship is first-class. This valve is so designed that when the disc is raised the passage through the body is fully equal to the diameter of the connecting pipes.

By means of the regrinding feature the usefulness of the valve can be prolonged indefinitely. When worn in the seat the valve can be reground without removing valve from connecting pipes.

Made in brass, medium and extra heavy patterns, screw and flange ends ¼ to 3 inches. Iron body, brass mounted, screw and flange ends 2 to 6 inches All valves are carefully tested and warranted.

Specify "Lunkenheimer" make. Sold by dealers everywhere.

Write for Catalogue of Steam Specialties.

.·.The Two Essentials.·.

The two essentials for a successful engine are Steam and a **Detroit Lubricator.** The steam furnishes the necessary energy and the **Detroit Lubricator** insures that almost all of this energy will be converted into useful work—not wasted in overcoming friction. We make different styles of lubricators to meet the different conditions existing in the various types of engines, so that all are enabled to work at their best and waste and wear are reduced to the minimum.

Our new catalogue is just out. It describes our full line of **Sight Feed Lubricators, Glass and Brass Oil Pumps, Glass and Brass Oilers, Multiple Oilers, Oiling Devices, Valves, Etc.,** and it will be sent to any part of the world on application.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

Nitro-Glycerine and Dynamite.

Explosive nitro-glycerine was discovered by Sobrero in 1847. It is produced by slowly adding glycerine to and gently stirring it in a mixture of nitric and sulphuric acids. The resulting compound is nitro-glycerine, a cream-colored, oily fluid, insoluble in water, possessing no odor, with a sweet, pungent flavor, and very poisonous. There are various methods of manufacturing nitro-glycerine, all based upon the principle stated. In some methods apparatus of a complex nature is employed to safeguard a process constantly attended by great risk. In others the manufacture is carried on in a comparatively simple manner. Of this character is the method devised by Mr. Engels, in which the acids are placed in an iron trough, around which a stream of cold water is constantly flowing through a jacket. The glycerine runs slowly into the acid bath through two small pipes, and is nitrated by a workman pulling to and fro, in the bath, a stirrer consisting of two iron grids fixed a short distance apart on a rod carried horizontally in bearings. When the nitration of a charge has been completed, the nitro-glycerine is run into a wooden receiver containing cold water, where the acids are separated from the nitro compound, which is then well washed. Every trace of free acid has to be absolutely removed to prevent the possibility of decomposition and the chance of ultimate accident. The final washings are generally made with an alkaline solution.

The Boutmy-Faucher method of manufacturing nitro-glycerine is interesting, as it differs from all other systems. Instead of nitrating the glycerine by introducing it gradually into a bath of nitric and sulphuric acids in which it is gently agitated, Boutmy and Faucher divide their process into three stages. They first prepare a mixture of nitric and sulphuric acids, and next a mixture of sulphuric acid and glycerine. The third stage is the mixing together of the two mixtures, and thus effecting nitration. The object is to obviate the chance of accident from an undue rise of temperature, which is prevented in the process of Engels and others by surrounding the nitrating vessel with a cold water jacket. The same total amount of heat, however, is developed in the Boutmy process as in the others, but its development is distributed over several stages, at each of which the development is comparatively small, even in the actual nitrating operation.

The practical application of nitro-glycerine to blasting purposes took place in the early sixties, the late Alfred Nobel adopting it on an extensive scale in this connection in 1864. Numerous serious accidents, however, occurred, and chemists set to work to devise means for rendering this dangerous liquid safe. This was finally effected by Nobel, who, after trying various forms of silica, adopted a highly absorbent siliceous earth (technically known in Germany as "kieselguhr"), as a carrier for the nitro-glycerine. This was the original dynamite, consisting of 75% of nitro-glycerine absorbed into 25% of "kieselguhr."

There are various kinds of dynamite, but they all consist of a mixture of nitro-glycerine with substances of a more or less porous character, and which are capable not only of absorbing a very large percentage of the liquid, but of retaining it under all ordinary conditions. In some dynamites the absorbent material is also combustible, or what is known as active, the main object being to increase the power of the explosive. In the case of "kieselguhr" dynamites, however, where the carrier is incapable of increasing the disruptive force of the compound, it is classed under the head of inactive absorbents.

In making "kieselguhr" dynamite, known as dynamite No. 1, the infusorial earth, or other absorbent material, is first calcined in a reverberatory muffle furnace at a low, cherry-red heat, in order to drive off all the contained moisture and to destroy all organic matter. On removal from the furnace the "kieselguhr," or infusorial earth, is sifted and crushed to the required degree of fineness by being passed between rollers. Care is taken not to reduce it to too great a degree of fineness, lest its retentive powers be impaired, although its absorbent properties might be temporarily increased. By reducing the guhr to a greater degree of fineness than ordinary, its powers of absorption is increased by reason of the opening up of a greater number of cells or pores formed by the shells of the infusoria. But in experimenting it has been found that when too finely crushed, after standing for some twelve or fifteen hours, the nitro-glycerine has freely exuded from the "kieselguhr." The limit of its absorbent and retentive power as regards nitro-glycerine would appear to be 75%.

The nitro-glycerine and the calcined earthy matter are taken to the mixing house, where a given quantity of the absorbent material is placed in a lead-lined trough, and the requisite proportion of nitro-glycerine is poured over it. The two are then mixed together by hand, about the same as dough is mixed. Although nitro-glycerine is highly poisonous, and although absorption by the pores causes a violent headache, and sometimes acute suffering of similar character in some subjects, the workmen, as a rule, soon get over the effects of impregnation. The two ingredients having been thoroughly incorporated, the dynamite is rubbed through wire sieves to insure the even distribution of the nitro-glycerine, after which it is taken to the cartridge sheds, where it is made up into cartridges of given diameters and lengths. Two kinds of presses are used for this purpose. In one kind the quantity required for each cartridge is pressed singly into its paper casing at one stroke; these are known as intermittent machines. In the other kind of press the dynamite issues in a continuous cylindrical stream, and is cut off in suitable lengths as it leaves the machine. These are known as continuous presses. Such is dynamite No. 1, generally called "giant powder."

Turning to dynamite with active absorbents, the first on the list in the order of date is gunpowder dynamite, in which gunpowder is the active absorbent of nitro-glycerine. This is an invention of Nobel, who, in the early days of high explosives, filled cartridges of black powder with nitro-glycerine, the powder acting as the absorbent or carrier. The next step in this direction was developed simultaneously by Trauzl and Abel. In each case gun-cotton dynamite was proposed. That of Trauzl consisted of seventy-three parts of nitro-glycerine, twenty-five parts of gun cotton and two parts of charcoal. Abel's compound consisted of nitro-glycerine absorbed into gun cotton and saltpeter, and was known as glyoxiline. The dynamites so produced by Trauzl and Abel, independently of each other, were used for a time and then superseded by the gelatine dynamites.

REFERENCE to official statements on page 707 will be sufficient answer to the numerous inquiries received, elicited by statements in daily papers, about gold mining in Siberia. As before, our advice to those contemplating unauthorized visit to Siberia is to give it up. It might result in a longer sojourn there than would be pleasant or profitable.

IN the interesting article on the 300-stamp mill at Douglas Island, Alaska, in the issue of the 16th inst., the statement was made that one reason why the mill saves so closely is that the sulphurets are distributed so evenly through the mass of ore. A further adequate cause is doubtless due to the absence of galena in the Treadwell ore. Another noticeable fact in connection with this subject is that the gold, after retorting, is worth $18.40 per ounce. In the article referred to it was stated that one-seventh of an ounce was produced every minute in the 300-stamp mill. This should have read one-ninth.

THERE is a line on the 705th page that is characteristic. In the notice of the destruction of the 50-stamp mill at the Commonwealth mine, Pearce, Ariz., last Sunday, is the fact that "the man at the hoist stuck to his post in the face of the flames." Despite the fire above and around him, he held his place and did not leave till every man was out of the mine. Nothing is needed to gild or embellish so plain and heroic an action, but the bravery of that engineer deserves due meed of applause and recognition. Such courage is characteristic of the miner everywhere.

AT Kansas City, Mo., last week a decision was given in the Federal court of some interest to mining companies and mining machinery manufacturers. Judge Corland ruled that companies engaged principally in mining are not subject to the law, inasmuch as they are "not engaged principally in manufacturing, publishing or mercantile pursuits," as a section of the law provides must be the occupation of persons, companies or corporations to be subject to bankruptcy proceedings. The decision was rendered in the case of the Victoria Zinc Mining Co. of Oronogo, Mo. The company had installed a new mill costing $72,000, the machinery contractors being preferred creditors. Other creditors attempted to force the company into bankruptcy and defeat the preferred claims of the machinery men.

Eight Hour Day in Montana.

The announcement that two of the mine operators in Montana have agreed to pay the same wages to miners for eight hours' work that they formerly got for ten hours' work will again bring to the front the same question that legislators recently attempted to decide in Colorado and British Columbia. In the American State and the British province the efforts failed, as all such efforts at sumptuary legislation always fail. The relation of employe and employer is a mutual one, and either can make and keep an agreement that could not be made or kept by such an impersonal creation as a government legislature. Just how the Montana experiment will result is not to be predicated; the inevitable tendency will be to have others follow the lead of Messrs. Clark and Heinze, for with those two paying $3.50 for eight hours' work it will be difficult for other Montana mine managers to get competent men to work ten hours for the same money. It will be noticed that this time there is no discussion of the ethics of the thing, or its fairness, or the tendency to lower wages for the skilled workman, or whether a man can and will do as much in a mine in eight hours for the same money as he would in ten. Usually some of these questions are talked about a good deal. But in the Butte case last week the men asked and the managers acceded, and that is all there is to it—so far. Meanwhile the question whether ten hours' pay for eight hours' work is as fair to the employer as eight hours' pay for ten hours' work would be to the employe is no nearer solution.

From a Montana standpoint the matter may be viewed as a political or personal one. It is probable that the idea was favorably forwarded by the two named, who employ about 800 men, to influence the amalgamated companies and the Daly management, who employ about 8000.

Some time ago the Montana miners tried to have the State Legislature pass an eight hour law. Their recent move is more feasible and gives better promise of definite result, and turn to practical account the feud between the Clark–Daly interests in that State.

ATTENTION is directed by the Scientific American to some experiments of W. Roberts–Austen, of interest to chemists and others. In 1896 he asserted that if a column of lead be placed upon a column of gold, and the two metals heated below the fusing point of lead, that the gold would evaporate to the extent of showing traces in the lower part of the leaden column in twenty-four hours. It was a theory of his then that at common temperatures as well, gold gives off vapors which would penetrate a baser body, and during the last four years he had kept such super posed metals subject to the ordinary heat of 65° Fahr., with the result, as claimed by him, that at the end of that period he has found that the gold had diffused itself in the lead, and that the amount of gold thus diffused diminished as the distance between the two columns increased. If his published conclusions are correct, while he has not proved that gold evaporates without the presence of another metal, he has shown that lead and gold may be made to mingle without applying unusual heat.

ONE of the first big electrical transmission schemes of the twentieth century in the domain of mining will be, probably, the development of the Rhodesia, South Africa, gold mines by power generated at Victoria Falls, in the Zambesi river, and brought from 350 to 500 miles. Ten years ago such a statement would have seemed absurd, but California has shown what can be done in the transmission of high voltage long distances, and of all businesses that of the gold miner can best afford to pay a high price for steady, reliable power, and if the gold be in Rhodesia the rest will work out as indicated.

REGARDING the report that the Commissioner of the General Land Office intended to withdraw the men who, as special agents, have been engaged in classifying oil lands in California, the Secretary of the Interior says, that while he may have to revoke some of the orders heretofore made withdrawing from entry and sale large sections of land in southern California, those who had gone on land and actually developed oil, or those who had entered upon the land in good faith to exploit for oil, would be given full opportunity to prove that such land is mineral.

Prices of Lead, Etc.

The American Smelting & Refining Co. report another drop in lead. Colorado reports the possible absorption of the Guggenheims by the smelter trust at the latter's figure—$35,000,000 in cash, preferred stock, and an additional bonus in common stock, thus eliminating the Guggenheim competition. There is no authentic statement as to the facts, the Colorado report being in the nature of a rumor. Regarding the proposed lead producers' association mentioned last week, it is very unlikely, as then foreshadowed, that any such organization will materialize. The compact contemplated too much contradictory to commercial dictates to stand any show of formation. Another proposition is reported to have been made by the American Smelting & Refining Co., to keep the price of lead at $4.12½ till Dec. 31, 1900, on condition that the leading lead producers agree to furnish all their continually produced ore to the trust till then, the $4.12½ to be N. Y. quotations, from which would be deducted the usual charges. Utah declares that leading lead producers of that State have signed contracts to that effect, an unlikely state of affairs which, from the producers' point of view, would be more interesting than prosperous.

A St. Louis dispatch says: "The principal owners and managers of the lead-producing mines of Missouri, Colorado, Utah and Idaho are to assemble at New York City the latter part of the week to discuss the slump in the price of lead and to discuss plans looking toward securing better prices for that product. But a few months ago lead was quoted at $4.70 per 100 pounds. Now, the price here is about $3.77. At Liverpool lead is quoted at $3.60; the duty is $1.50 and cost of transportation 10 cents. It is believed a combination of the lead producers could secure an advance in the present price of the metal, when this difference is considered."

Commenting on the above, a Washington paper says: "The seriousness of the recent slump in prices of lead to the Cœur d'Alenes is readily seen. The present lead production of the district is estimated at 80,000 tons per annum. The slump from $4.70 to $3.77 per cwt. is a drop of $18.60 per ton, or a loss to the mine owners of $1,468,000 per annum. If the price could be advanced but 1 cent per pound, it would mean a difference of $1,600,000 in their favor."

The Tribune, published at Salt Lake City, Utah, says: "The settling price that will rule this market through the week receded to $3.66½ per 100 pounds. This is the lowest figure at which the metal has ruled since December, 1898, when it advanced from $3.60 to $3.67½, and early in 1899 moved up to $3.70—the lowest price the producer was compelled to accept for it during that year."

THE International Mining Congress was in session in its third annual convention at Milwaukee, Wis., during the week, and filled the measure of conservative expectation. If it did not advance it certainly did not retard the interests under discussion. There are many manifest needs of the mining industry that can only be secured through agitation, earnest work and appeals to the intelligence and requirements of those most vitally interested. Prominent among these are revision of the Federal mining laws and creation of a national department of mining, a governmental bureau, with a Cabinet officer, whose title, "Secretary of Mines and Mining," shall indicate the scope and function of his work. Both can be secured; progress has been made, and every time public attention is directed to these subjects in any way, some advance is made toward ultimate success.

TWO PAGES in this issue are devoted to proper representation of the present condition of the work for which a State and Federal appropriation of $500,000 has been made. The novelty of the work itself and the difficulties surrounding its inception have made progress necessarily slow. It is at last in a fair way to have practical shape, and the magnitude of the interests involved make it desirous that further delay be as brief as possible.

Concentrates.

THE latest New York quotation on oxide of uranium is $4 per pound in 10-pound tins.

TO BRIGHTEN or "purify" rusty gold is not an easy task; mechanical abrasion, grinding in a pan is clumsy but efficient and is recommended.

NEXT Saturday's issue of this paper closes its 40th year, its 80th volume. A complete index for the current volume—No. 80—will be published therewith.

TO DRIVE an automobile weighing 500 pounds at a rate of 10 miles over smooth roads requires about 2 H. P. If the road is on a grade of 1%, nearly 50% more tractive force is required.

THE temperature of the cyanide solution has an appreciable effect on precipitation; many cyanidists say that at a temperature of 90° F. there are better results than when it is lower.

THE locator of a mining location in California "made now" has till Dec. 31, 1901, to do the necessary $100 worth of work or improvements. The law of 1897 was repealed by the last legislature.

THERE is no such thing as "liquid sulphur," that is, normally, any more than "liquid gold" or "liquid lead." There is a medical preparation made by boiling sulphur and lime together; but that is a different compound.

ROTARY ENGINES are patented every week; they're all right, only they don't or won't work. A water wheel is a good "rotary engine," but with steam there is constant difficulty in making satisfactory commercial result.

ONE way to tell what a boiler is doing is to find the number of pounds of water evaporated per hour: 30 pounds from feed at 100° F., evaporated into steam at 70 pounds pressure, or its equivalent under different conditions, constitute 1 H. P.

IN the recent Montana mining suit—the Colusa-Parrot vs. the Anaconda — Clarence King, N. S. Shaler and R. W. Raymond for expert testimony got each $100 per day and mileage; the others got $50 per day and mileage. They were paid $25,450.

TO GIVE iron or copper articles a fine durable brown color, make a paste of finely powdered iron oxide with alcohol. Apply with a brush uniformly, heat over an open fire, rinse and polish with a soft brush. If the desired color is not produced, repeat the operation.

A METAL POLISH in liquid form is a rare article, but the following may serve: Dissolve 15 parts of oxalic acid in 120 parts boiling water, and add 500 parts pulverized pumice stone, 7 parts oil of turpentine, 60 parts soft soap, and 65 parts of any kind of fat oil, using parts by weight.

A 3% TIN ORE could be worked at a good profit. Tasmanian tin companies find profit in concentrating a tin ore assaying 2%, the cost of mining and concentrating being about $2 per ton. So far as the writer knows, there is no present tin deposit being worked in the United States.

AN assessment of mine stock has been made in cases where treasury stock remained unsold, and the legality of such assessment has been attacked, but "Concentrates" is unable to cite any court decision on the subject, though it is believed that the assessment would stand.

SOME geologists hold that the so-called greenstones of Minnesota are the oldest known rock, representative of the original crust of the earth formed from the molten mass by the earliest consolidation. Others think the Canandian Laurentian rocks are older. The weight of evidence favors the former opinion.

BLANKETS for sluices are not specially made for that purpose. An inferior grade of Brussels carpet is about as good as anything. Where about 27 inches wide and 11½ inches on each side and 24 inches in the clear it gives satisfactory results. The ordinary grade blanket, and in some instances canvas, is used satisfactorily.

A MIXTURE of ten parts of white lead, three parts black oxide of manganese and one part litharge will stop a small leak in a steam boiler, but no dependence should be placed upon the result; that is, it may do in an emergency for a little while, but the leak itself is evidence of structural defect that needs radical treatment.

MASSICOT is an amphorous yellow powder, formed by heating lead on a flat hearth to a low red heat, removing the film of suboxide as fast as it forms, and oxidizing it to yellow oxide. If the temperature is raised to a bright red heat, and the fused oxide cools, it solidifies as crystalline litharge. Litharge is slightly soluble in water, readily so in acetic acid.

IT is figured that compared with 1870 there is in 1900 a decrease in the cost of steam power of about 38%. Of this 17% is credited to the use of multiple cylinder engines, steam jacketing, higher steam pressure and superheating the steam, 5% to vertical engines, 7% to improved boilers, 7% to economy realized in feeding the heat water, and 2% to improved construction of grates.

IN operating a siphon the lower end of the discharge arm must constantly be below the level of the water in the supply basin. When the weight of the water per square inch of sectional area in the up-tube equals the atmospheric pressure per square inch on the water in the supply basin, the siphon will cease to flow. Theoretically, the atmospheric pressure will support a column of water 34 feet high, as the weight of such a column of water 1 inch square in cross section is fifteen pounds. But, in practice the siphon will not flow satisfactorily when the top of the up-tube is more than 26 feet above the level of the water being drawn off.

BRIQUETTES said to possess heating value three times that of coal briquettes are made as follows: Petroleum, 10 liters; resin, 1 liter; soap powder, 1.5 kilos; caustic soda, 3.3 kilos; sawdust, 3 liters; these are mixed with sand by constant stirring. In about ten minutes the mass begins to solidify; if liquid be still present, soda is added. The mass thus obtained is formed into briquettes and cooled.

IT is the opinion of some cyanide experts that, so far as the chemical part of the process regarding the solution of gold by cyanide is concerned, there is not much room for further advance, and that whatever improvement is made will be largely of a mechanical nature. It is, however, generally conceded that in the matter of precipitation of gold from the cyanide solution there is yet much to learn.

TO DETECT sewer gas, wrap the suspected joint in the pipe with one layer of white muslin moistened with a solution of acetate of lead. If sewer gas escapes, the cloth will be blackened. To detect the escape of coal or illuminating gas, mix dark soap and water in the proportion of two pounds of the former to three quarts of the latter; apply the mixture to the gaspipe, when, if gas is escaping, bubbles will immediately form.

IN putting cylinder head on engine cylinder, the nuts on studs screwed up tight enough to make a steam joint, to then admit 100 pounds steam boiler pressure, would put more load on the studs and would add to the strain. Say the cylinder were 10 inches area; to admit 100 pounds would make additional strain of 1000 pounds divided among the six (or other number of) studs. Were the studs too far apart the packing would blow out.

WHERE air has been compressed to a certain pressure, and has by transmission to any reasonable distance been reduced to its normal temperature, if the air is reheated and expanded the extra volume resulting from the expansion is produced by an expenditure of heat much less than that at which the original volume was produced. With dry air two expansions are all that can be had; with reheated air it is possible to get five expansions if the air is well saturated.

GOOD boiler makers say that the best way to make a manhole is to cut the hole considerably smaller than required, and then flange it in with a straight flange on a radius not less than three times the thickness of the metal. In place of attempting to rivet on a piece of plate to make up for that cut away, it is better to make the original plate that much thicker; or the flange may be reinforced by shrinking on a reinforce ring around it, and this should always be done where the plate is one-half inch or less in thickness.

TO ASSAY cyanide liquor for gold, acidify a pint of the cyanide liquor with hydrochloric acid and heat to boiling; while in ebullition add a solution of two grains of lead acetite; then pass in a current of sulphurated hydrogen gas until all the lead is precipitated as sulphide. Allow the solution to cool sufficient to thoroughly saturate with H_2S gas, when the gold will be precipitated with and collected by the lead sulphide; the precipitation may then be filtered off and dried, and subsequently determined by the fusion method in crucibles or the scorification method of assaying.

WOOD-CUTTING TOOLS are usually made somewhat softer and with more of a spring temper than the thicker edge of metal-cutting tools. The process is the same for both, but the temper is drawn lower or to a bluish tint. For wood-cutting tools hardened in oil a slow fire should be used, so as not to burn the corners and edges by overheating. Heat to a cherry red and quickly plunge, edge first, in the oil bath. While the thick part of the tool is still hot, place it over the fire and slowly heat until the oil takes fire, then plunge again in the oil bath or water. The bluing process of tempering is much used, and is done by cleaning the surface of the hardened part of the tool with emery paper and then heating by contact with a piece of redhot iron just back of the cutting edge. When the color has reached the blue tint, plunge it in water.

GELATINE DYNAMITE occupies a position midway between dynamite and blasting gelatine. It is blasting gelatine toned down for general purposes as well as in circumstances where the latter would be too powerful. Gelatine dynamite consists of about 80% of blasting gelatine containing 5% of gun cotton, the remaining 20% being an absorbing powder composed generally of potassium or sodium nitrate mixed with wood pulp. Ammonium nitrate is used in France and Italy in place of the potassium and sodium nitrate. Rye flour is sometimes employed in place of wood pulp. There are, however, disadvantages attending the use of ammonium nitrate. Although greater effect is obtained, the dynamite becomes hygrometric and the ammonia nitrate turns acid. An article on the front page gives further data asked for.

THE specimen of emery submitted from Los Angeles county, Cal., is deficient in abrasive power, and hence of little commercial value. Emery stone possesses oxide of alumina, titanate of iron, limestone and oxides of iron. Upon the percentage of anhydrous oxide of alumina in the mineral depends its abrasive power, and in the sample sent from Los Angeles county this percentage is insufficient to make it of much value. To test the abrasive power of emery, take a small glass mortar with glass pestle; carefully and exactly weigh the pestle. Place in the mortar one gramme of fine granular emery; add three grammes water; triturate the emery with a regular pressure and motion as long as the least grittiness or bite on the glass can be felt. When it is found there is no more "bite," wash clean, thoroughly dry the pestle and again weigh it. Its loss in weight will represent the relative abrasive power of the emery under examination.

THE most recent test noted of determination of the loss of gold and zinc in smelting cyanide slimes is that furnished by R. M. Aitkin, the result of operations on material taken from the furnace chimney offal of the Boatman's cyanide plant at Reefton, N. Z. He took a sample of the incrustration formed on the furnace chimney, which was composed for the most part of brick, owing to the strong adherence of the coating of zinc oxide, which was not readily detached. The incrustation under the microscope presented the appearance of a yellowish white efflorescence, but showed no metallic gold. The sample taken weighed twenty pounds. This was crushed roughly and separated into two portions on a 30-mesh screen: pass 30-mesh screen, thirteen pounds; refuse 30-mesh screen, seven pounds. The two samples were then assayed separately with the following result: Fine sample, 8416 gr. pure gold per pound; coarse sample, 3263 gr.; the twenty-pound sample containing 5 dwt. 12½ gr. of gold. By panning the finely crusted material a yellow film or tail was seen, having the appearance of a stain or coloring. The microscope showed this to be finely divided particles of metallic gold, rich in color, of spherical form and of very even size. In this furnace a little over $5000 worth of bullion was smelted, and, as only a small portion of the fume would deposit itself upon the walls of the chimney, the loss may have been considerable. Whether the gold was carried away by the draft as fine slimes or by volitilization of the bullion, there was nothing to show. The furnace used to draw well, and had a stack of about 15 feet. In smelting, where the slimes are well oxidized and properly fluxed, the loss of zinc must be extremely small, as nearly all the zinc goes into the slag, excepting that portion reduced in the smelting, which partly enters the bullion and partly escapes as a fume. It would appear, however, from Mr. Aitkin's tests, that the portion which does not volatilize, and also the fine particles carried away by the draft, is rich in gold and worth saving.

A DYNAMO is a machine for converting mechanical energy into electrical energy. It generates an electric current when driven by mechanical power. The name "electric generator," or simply "generator," is often applied to a dynamo, especially when used to produce current for motors. An electric motor is a machine for converting electrical into mechanical energy. It produces mechanical power when supplied with an electric current. An electric motor is usually called simply a motor, and although "motor" might mean any thing producing motion, it is very rarely used in any other sense. The two machines—generator and motor—are very similar in their construction. A generator may be used as a motor if supplied with an electric current, and a motor may be used as a generator if driven by mechanical power, so that the two machines may be regarded as one, and if the construction of the motor is understood the construction of the generator is also understood. The action of both generator and motor depend entirely upon the movement of conductors in magnetic fields. The conductors are generally arranged on a rotating part, the armature, between the poles of a magnet or magnets, which is generally called the field magnet. The armature usually consists of a core of iron, on which are wound or fastened the conductors which carry the current. This core is generally made up of sheet iron. The field magnet generally consists of one or more iron or steel cores, on which are placed the field coils. Attached to these cores are the pole pieces which form the space in which the armature revolves. The output of the generator is measured in volts and amperes, the voltage being analogous to the pressure of steam in the engine cylinder, the current to the volume of steam. These two multiplied give the watts, and the watts divided by 746 give the horse power; so that, if we had a generator furnishing 250 amperes at 220 volts, we should have 250 multiplied by 220, equaling 55,000 watts, or 55 kilowatts; 55,000 divided by 746 equals practically 74 H. P. The analogy of steam or water pipes may be taken for illustrating the meaning of "loss in the line." If a certain quantity of steam is carried through 100 feet of pipe and the loss in pressure equals 2 pounds, the loss will be 4 pounds if the steam is carried 200 feet, provided the same metal pressure is kept, due to friction in the pipe. In electric currents going over wires there is a loss in exactly the same ratio; that is, if in 1000 feet with 100 amperes at 220 volts there is a loss of 10 volts, there will be a loss of 20 volts if the same current is carried through the same size wire 2000 feet. Following is a simple formula for calculating the size of a wire when the allowable loss in the line is given: Circular mils required in the conductor equals $\frac{10.8 \times L \times C}{N.}$ Where 10.8 is constant, L equals the length of wire in the circuit—that is, from the power station to the machine and return; C equals the current; N the allowable number of volts loss in the line. For example, allow a loss of 10 volts in a circuit carrying 50 amperes over a complete circuit of 2000 feet, then one would have $\frac{10.8 \times 2000 \times 50}{10} = 108{,}000$ circular mils. The nearest size wire is No. 0, which has 105,592 circular mils.

Penn Mining Co.'s Matte Smelting Plant, Campo Seco, Calaveras County, California.

Written for the MINING AND SCIENTIFIC PRESS by EDW. J. FOWLER.

This plant, located on the banks of the Mokelumne river, about 1½ miles from Campo Seco, affords excellent means of transportation to and from the mines and railroad station at Spring Valley, 6 miles distant, and has a good water supply from the river.

Unwatering the mine started in October, 1898, at shaft No. 2, on the Satellite claim, and on September 16, 1899, the smelter was blown in, the plan being to smelt the dumps and mine ore together in a small, experimental plant at first, which plant has been running on a nearly continuous scale ever since the blow-in.

Ore is hauled to the smelter after weighing and is unloaded upon a receiving platform—40x75 feet—where it is broken and sampled by the 1–10 shovel method. The 1–10 is crushed, rolled and quartered to a sample pulp in the adjacent sample room on the same level, containing one Blake crusher and one pair of Fraser & Chalmers rolls, also buckboard room and various sampling devices.

The 9–10 shovels are passed directly into stock bins—eight in number—holding about 300 tons each. These bins are 15 feet deep and open at the bottom into a charging floor at furnace feed door level.

This charging floor is 75 feet long by 12 feet wide and contains, besides the brick furnace, stock feed plates and an automatic eight-beam Fairbanks charging scales, where all charges, in wheelbarrows, are weighed before charging into the furnace.

The tapping floor, 15 feet below this floor, containing the furnace proper, slag pots, fore hearth, hot water pump and furnace tools, is covered with a suitable roof and paved with slag bricks. A matte room is also located on this floor, containing a crusher and sampling devices for handling the shipping product.

A power elevator runs from tapping floor to charging and receiving floor, where matte is weighed and stored in a suitable matte house, and from thence loaded for shipment.

Power for the electric plant is generated in one 60-inch by 16-foot Atlas tubular boiler, burning coal, and located in a room, with other machinery, 60x30 feet.

Furnace blast is derived from a direct connected couple consisting of an 11x15 Erie engine, driving a No. 5 Connersville blower. An 8x10 Nagle engine drives the line shaft supplying power for dynamo, sample room, elevator and crushers.

The plant is lighted by a 25 D Crocker–Wheeler generator, running sixty 16 C. P. incandescent lights. The entire steam system is covered with non-conducting asbestos covering.

Water is pumped direct from the river to a 10,000-gallon tank on the hilltop above the smelter and supplies smelter, mine and houses. The outfit used to handle this water is located in a pump house on the river bank, and consists of one Smith–Vaile duplex pump, automatically regulated by float and cable line from the tank, while a reserve supply of one triple electric and a power pump driven by a gasolene engine insures steady and abundant supply in case of need. The pumps work against 85 pounds pressure at the pumphouse. Hot waste water from the furnace pumped from the overflow to a small tank above the smelter is used over again through the jackets, diluting slightly with cold water. A small portion of this water, at about 150°, runs to a heater in the engine room and there is heated to 205° or 210° by exhaust steam from the engines and used as boiler supply.

The furnace is of special design, 36x36 inches at the tuyere line, intermittent tap. The matte and slag run into a large forehearth, where the matte settles by gravity and is tapped at intervals into large pots, and dumped cold.

Water-cooled furnace jackets are of steel and extend from the base to the feed floor, above which a common brick stack is built, with a downtake from it to a dust chamber on the feed floor, where the flue dust is recovered for future smelting, if desired.

The furnace stack has a door in the top, together with side ventilating hoods over the feed doors, which reduces troublesome fumes to a minimum.

The furnace blast enters at atmospheric temperature through four or six tuyeres, at the will of the operator.

The slag dump is 35 feet deep to the river bed and offords ample capacity for waste.

The assay office, tool rooms and oilhouse complete the smelter equipment.

ORES.—Three varieties of ores are available for the smelting mixture:

First—Sulphide ores from the mine, carrying copper and iron in large amounts, with gold and silver.

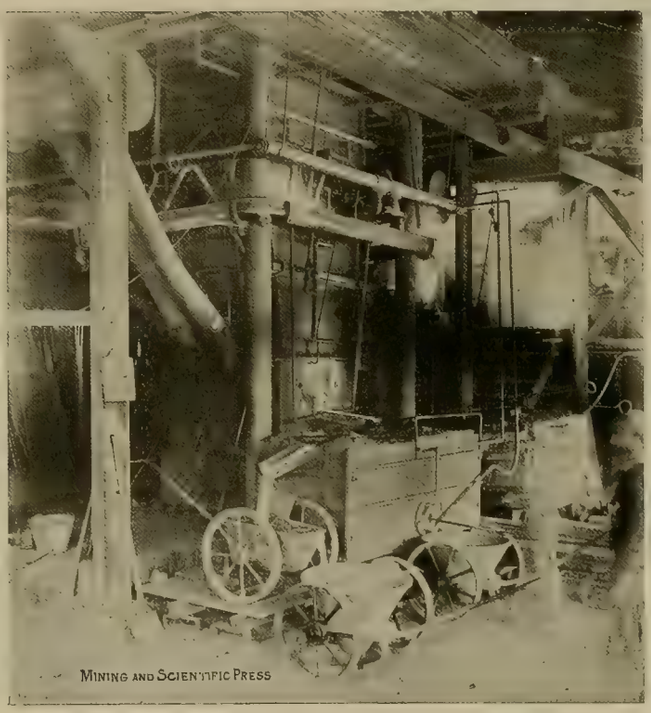
Second—Roasted ores from the dumps, high in silica, but carrying considerable gold, silver and copper.

Third—Carbonates, oxides and sulphides, very siliceous, from the oxidized zone of the vein.

Lime and quartz for flux are in abundance near the plant.

The general practice is first to smelt on low coke consumption the raw mine ores, mixed with the roasted dumps, all slag dumped to waste. The resulting matte is then resmelted with quartz or carbonates on lower coke and run to the desired grade of 50% or 60% copper for shipment.

The slag from this concentration is resmelted on the ore charge, and, acting as a partial flux, on account of its low fusibility, increases the ore tonnage.



The impurities present in all the ores are confined to zinc and alumina, the former at times running very high and causing considerable trouble.

The furnace, with a hearth area of 9 square feet, averages fifty tons pay ore and eighty tons total charge per twenty-four hours.

Reconcentration is used often, as it improves the condition of the furnace by cutting out crusts, and at the same time carries much siliceous ore over and above what the regular charge will accommodate, the greater speed of reconcentration increasing the siliceous tonnage. As high as 125 tons of matte, fuel, flux and ore have been smelted in twenty-four bours on this charge.

The mine is equipped with hoist, compressor, drills and pumps, and houses are erected on the property for the convenience of the workmen.

This property is an old producer, having in years past shipped cement copper from its large roasted dumps, and, with the influx of modern methods of metal extraction, bids fair to become one of the largest copper producers of the State.

Lining Shafts With Concrete.

At Ougree in Belgium an air shaft has been sunk for a depth of 100 m., from 480 m. and 580 m., in order to examine the ground below the principal seam wrought in the district. The strata, already known from the winding shaft that had been sunk previously, were in the upper part regular and moderately stable, but lower down, while maintaining the same character, they were more disturbed, the dip ranging from 50° to 75°, and feeders of water were met with in some sandstone beds, so that the ordinary method of sinking—using provisional means of supports by timbers or iron frames, and subsequent lining with brickwork, which was followed for the first 50 m.—was not considered to be desirable for the lower part. For this another method was proposed, namely, the use of a closely fitting lining of iron channel rings, supported by iron uprights placed 1 m. and filled up with brickwork, but was found to be impracticable, owing to the high price asked for the ironwork, and, consequently, recourse was had to the use of concrete alone, in the following manner: The sinking was cut out to the full size, without any lining, to a depth of 3 or 4 m., and even more in favorable ground, and a series of four horizontal cross-timbers was laid near the bottom. Upon these was placed a cylindrical wooden frame 1 m. high, whose outer surface, 3 m. in diameter, corresponded to the size of the finished shaft, and concrete was filled and rammed into the hollow between it and the side of the excavation, a distance of 250 mm.; a new frame was then placed above the first, and so on until the bottom of the lining above was reached, the joint being made good by ramming in the last 6 inches horizontally. The cement used was made from blast furnace slag. The concrete was made with broken blast furnace slag and sandstone obtained from stone drifts in the colliery, mixed in the following proportions: Sandstone, 1100; cement, 250; broken slag, 650; 2000 kgs. giving 1 cubic meter of concrete. The resistance of such concrete to crushing is about 300 kgs. per square centimeter, while that of good bricks only averages 12 kgs., so that with less thickness a more resisting lining is obtained.

THE zinc works at Arnao, Spain, obtain 50,000 tons of coal a year from a coal mine, which extends under the Bay of Biscay. On the sea side of the shaft, working has to be carried on with precaution. The water-tightness of the submarine portion of the mine is due not only to the slowness with which the working is carried on, but also to the existence of beds of shale which fissure and swell as the sea-water filters through. The Arnao coal, from below the sea, is hard, brilliant and whitish, due to scales of calcium sulphate.

Outlines of Structural Geology.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by J. A. EDMAN.

At this point in geological history we find a series of alternating beds of sedimentary and igneous rocks, generally horizontal or slightly inclined, and frequently reaching a thickness of 20,000 feet or more, but so far not materially different from their original composition, except in the compression by gravity of the lowest strata. As, however, the crust of the earth is not absolutely rigid, but is amenable to gravity as well as to other dynamic forces, wherever a series of formations as above described attained a great depth, it would gradually subside and the lowest strata would come under the influence of the earth's internal heat and become plastic in various degrees according to composition, and in some instances semi-fluid, which would impart to some portions a certain degree of mobility. A subsidence would always be compensated for by the elevation of an adjoining already plastic section of the crust, which perhaps had been thinned by sub-aerial erosion, and ranges of hills or mountains would result near the region of subsidence, bringing to the surface formerly buried strata more or less metamorphosed by heat and pressure. By these movements of subsidence and elevation both the subsiding and rising formations would be thrown into various folds, compressed and stretched when plastic, or faulted and fissured where more rigid, and the fault planes and fissures at great depth could not remain open, but would fill as soon as formed by the most abundant and most mobile elements of the adjoining rocks, among which silica, forming on an average over 70% of the rocks of the globe, would be and practically is the most prominent. Other elements and compounds would follow, generally dissolved in the silica. Hence the origin of our fissure veins.

But here again comes in another phase of igneous action, for when the movement of the crust during subsidence was great enough to produce deep-reaching faults or fissures, these would communicate with the fusion zone of the globe and give vent to fluid rock and form dikes or pipes, either reaching to the surface, or when meeting partings between strata invading these and forming the intrusive sheets termed "laccolites." The passage of the molten matter through these dikes and pipes has frequently served to raise the temperature of adjoining rocks, and has brought about in them many chemical changes, as evidenced in our ore deposits; but it is to be noted that these dikes form the only true fissures communicating with the permanently fluid or semi-fluid zone. At depths exceeding 30,000 feet, physics teaches us that water, as such, or watery solutions, cannot exist, but will be found only in chemical combination with the rocks, or as superheated steam under enormous pressure, and it also teaches that an open space cannot long exist at such or greater depths.

The term metamorphism has been applied to the above described action by which the original sedimentary as well as the interbedded igneous rocks were subjected to heat, compression and chemical changes at great depth below the surface and excluded from meteoric influences, and the so modified and altered and generally consolidated rocks have been called metamorphic. Metamorphism must be strictly distinguished from the subsequent alterations which rocks undergo when near the surface, which is treated of in the following pages.

The foregoing sketch of geological events, while chiefly used to illustrate the building up of the Sierra Nevada and the geological ages these represented, applies also with modifications to most other regions of the globe, and all geological epochs from the Archæan to the present, for from the first "fiat" that brought forth land and water the immutable laws were fixed governing the earth, and the natural forces have been acting since then silently and wisely and without cessation, both to illustrate the wisdom of the Creator and to make the earth a perfect dwelling place for man.

There is, however, still a chapter of geologic history to be referred to, to complete the earth cycle and to present the last stage of transformation of each formation which I have above described as deeply buried and undergoing metamorphic action. This stage I shall call the "Sub-aerial," none the less important because, as a rule, geologists have not fully studied it. It refers to the changes in the rocks when elevated again to the surface, often after immeasurable periods of subsidence, and gradually brought within the influence of air and moisture.

All the strata, both unaltered and metamorphic, suffer their first change during their period of elevation from the action of the waves on a coast line when emerging from the sea, and, simultaneously, an internal modification from infiltrating water while approaching the surface, followed by a still greater alteration from the constant action of air and moisture while rising higher into hills and mountain ranges. Here the degrading and eroding forces came into play as well as the oxidizing and hydrating power of the atmosphere, by which latter even the hardest rocks are resolved into their simplest possible minerals. All soluble elements go into solution in lakes and rivers, and the insoluble parts, as sand, gravel and sediment, are transported by the same waters again to the sea, to form new sedimentary beds, to increase the solutions in the ocean and to complete the everlasting cycle.

Applying the above broadly accepted scheme of geological events as our basis, we may deduce from it some general laws bearing on the genesis of ore deposits, which, as related to the Sierra Nevada, are founded upon the accumulated experience of many observers during more than half a century in the thousands of mines of the Range. When rationally interpreted in the true light of science, these laws may be stated and arranged under three general divisions or corresponding stages in the existence of ore deposits, as follows:

First stage.—Sources of ore deposits (origin).

Second stage.—Consolidation and metamorphism (growth).

Third stage.—Oxidation and hydration (maturity and decay).

SOURCES OF ORE DEPOSITS.—The various sedimentary beds contain all the metalliferous matter of the older strata from which derived and from their associated igneous rocks, and also whatever has been precipitated from solutions in the sea water during their formation. The sea water contains gold, silver, copper, lead, zinc, cobalt, nickel, manganese and iron, besides many other elements, and these have been constantly precipitated as sulphides, arsenides, tellurides, selenides, iodides and their compounds, by carbon and organic matter suspended in the sea water and mingled with the sediments, the precipitation depending generally on the amount of carbon present.

The amount of the precious metals held in solution by the sea water is far in excess of the popular estimates.

Soustadt's and Munster's investigations on gold in sea water show its universal distribution over the globe, and the latter estimates the amount to be $\frac{1}{3}$ of a grain of gold to the ton of water. On this basis, and Geikie's estimate of 400,000,000 cubic miles as the contents of the ocean, each cubic mile would contain a value of $133,000,000 in gold, and all the sea the stupendous amount of $53,169,000,000.

Malagati and Durocher, fifty years ago, established the universal presence of silver in the sea to the extent of one centigramme to the cubic meter, equivalent, according to their estimate, to 2,000,000 tons of silver in all the oceans of the globe.

Special enrichment mechanically of a stratum may occur from metalliferous sands deposited on a coast line from rivers, from the shingle of a tidal bank and from the conglomerate forming on a coast. Chemically, an enrichment of a stratum occurs at a period of oscillation, when a deep sea bed rises into shallow water and a concentration of solution takes place, with organic matter present in abundance, as when coral banks are forming, and in still greater degree when an arm of the sea becomes land-locked and its waters concentrated by evaporation, as when saline beds are formed. Effusive lavas flowing into a shallow sea would give rise to an increase of soluble matter and a concentration of solutions, as well as cause abundant chemical precipitates of metallic and other minerals. A bed, when once deposited, while yet remaining under the sea, may be acted upon by the constituents of the water above it and of any bed superimposed upon it, as evidenced by the replacement of lime by silica in solution, by which action a limestone stratum may be changed into hornstone or quartz. In a region composed of gold-bearing rocks and in which various sedimentary deposits have formed either in the open air or along a shore line, a gradual subsidence below the sea level and the superposition of new strata upon the original surface, with subsequent metamorphism of the whole, would originate various auriferous deposits difficult to recognize or classify. Such deposits occur in California; the Witwatersrand banket in South Africa furnishes an example of partial metamorphism of an ancient shore formation, while the now accumulating bank at the mouth of the Klamath river presents a most striking instance of the modern formation of a littoral auriferous deposit.

(TO BE CONTINUED.)

Largest Oil Conduit in the World.

The first section of the largest oil pipe line in the world for the transportation of refined oil has been completed, and started April 7, 1900. The pipe line was constructed by the engineers of the Transcaucasian Russian State Railway. The pipe runs parallel to the railway track, 560 miles long. It is intended to run it the whole length of the Transcaucasian Railway from Baku to Batum, the first section completed being 145 miles. The pipe is wrought iron, lap welded, having an internal diameter of 8 inches, and was made in Russia from native materials.

The first section has three pumping stations, each station having two pumping engines, one for continuous working and the second for reserve. The pumping engines are the largest and most important which have ever been put to work in connection with the transportation of petroleum through pipe lines. There are six compound high-duty pumping engines, with condensers and compensating cylinders, each engine having steel cylinders 21 and 42 inches in diameter, plungers of 8½ inches, all having a uniform stroke of 24 inches. Each engine works against a pressure in the delivery pipe of 650 pounds to the square inch, the steam pressure being 150 pounds to the square inch. Against this heavy pressure of 650 pounds per square inch, each engine will be required to deliver 416,275,200 gallons per year, this being the quantity of oil which will be pumped through this pipe.

The Value of Topographical Surveys in Hydraulic Mining.

Written for the MINING AND SCIENTIFIC PRESS by L. H. CARVER.

The statement attributed to Napoleon that it requires three things to win battles—money, money, money—may be applied with equal aptitude to the success of mining operations. Money is indeed a potent and essential factor in successful mining, and many properties are now lying idle for want of the necessary capital to put them in proper working order; but many more are idle that, having first had a plentiful supply of money to draw upon to outfit the property, have been so grossly mismanaged that it becomes impossible to show any profit in the work ing, and the mine is shut down with the usual excuses. This is the case in too many instances, and the problem to be solved is to eliminate, as far as possible, the causes that tend to produce these disastrous results.

It is not possible to offer a solution that will apply in all cases or cover every failure, and it would obviously be preposterous to attempt it. We can, however, show that a more careful and systematic investigation at the beginning, before a large amount of money has been expended in establishing a plant, to prove the correctness of the many different theories in regard to the "pay," would materially lessen the number of failures. The preliminary showing is found to be satisfactory, and it is determined to go on with the work.

It is sometimes possible, from the configuration of the ground, to judge precisely where it can be opened to the greatest advantage, but generally it is advisable to make a complete topographical survey and map in order to spread the exact conditions of the surface clearly, accurately and comprehensively before the mind. Such a survey is not abnormally expensive, as large areas may be accurately covered in the field, with a small party, in an astonishingly short time by employing the stadia method, and the money expended for this purpose is wisely spent.

Particular attention should be given to the accurate location of all test shafts or pits, taking notes of depth to bedrock, where possible; location, elevation and dip of exposed bedrock should also be carefully noted, together with elevations, grades and courses along gulches and ravines, to establish their probable utility for dumping purposes.

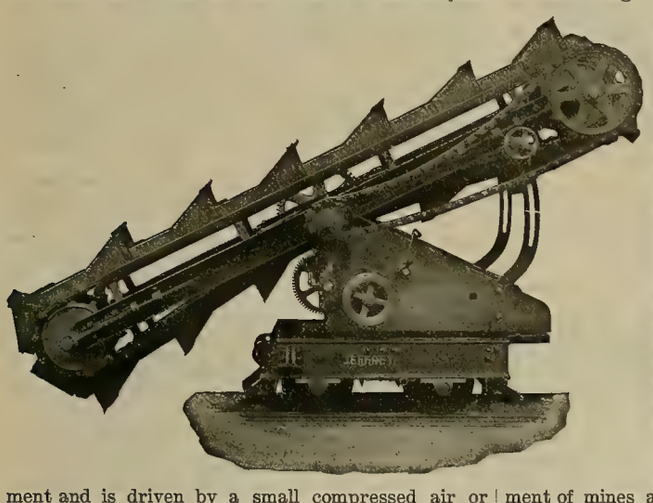
The test shafts should be located systematically at regular intervals or measured distances apart, both transversely and along the course of the channel, distinguished by numbers or letters and marked on the ground, being designated on the map by corresponding numbers or letters. The different values of material, having been ascertained by careful testing at each shaft, will also be noted on the map in their respective positions.

With a complete topographical map before one, it would not be a difficult matter to lay out the work intelligently. Contour lines would show the differences of the slope as they approach each other or lay farther apart, and make it possible to read off the elevations or the difference of elevation of any points instantly. They would be convenient also in many instances to show just where the ditch line would be located and its length, in advance of actual survey and construction, and equally advantageous in selecting the best point for a dump.

Comparison could be made between the depth to bedrock in the shafts and the outcropping at the rim, with dip and the actual cross-section established in some cases. The area of the best "pay" could be as readily located and shown upon such a map, as are the shoals and channels on the hydrographic maps of the Government, and the location of the sluice-boxes could be determined to a certainty for any desired gradient that would admit the greatest possible dumping facilities.

By simple measurement from an established base, the record of the amount of work for each month could be shown and the amount of material moved accurately computed.

As it is not possible to obtain, in the first instance, a test of hydraulic propositions under actual working conditions, as in quartz mining, much care and attention is required to collect and produce such information and data in proper form, so that each step may be intelligently worked out and thus reach a combination that goes far to insure a successful result, when the true economic conditions are fully understood and appreciated.



Two Years' Iron Production.

The annual report of the Iron & Steel Association gives the output of 1899, as compared with 1898, in gross tons, except coke and nails:

Articles—	1898.	1899.
Iron ore shipments from Lake Superior	14,024,673	18,251,804
Connellsville coke shipments, net tons	8,460,112	10,129,764
Pig iron, including spiegel and ferro	11,736,934	13,620,703
Spiegeleisen and ferromanganese	213,769	219,768
Bessemer steel ingots and castings	6,609,017	7,586,350
Open hearth steel ingots and castings	2,230,292	2,947,316
All kinds of steel	8,932,857	19,636,857
Structural shapes, not including plates	702,197	906,277
Plates and sheets, except nail plates	1,448,301	1,903,505
All rolled iron and steel, except rails	6,532,129	8,084,697
Bessemer steel rails	1,976,702	2,270,585
All kinds of rails	1,981,241	2,272,700
Street rails included above	143,815	154,246
Iron and steel wire rods	1,071,683	1,099,376
All rolled iron and steel, including rails	8,513,370	10,357,397
Iron and steel cut nails, in kegs	1,572,221	1,804,340
Iron and steel wire nails, in kegs	7,418,475	7,599,522

Portable Loader.

The accompanying illustration shows a portable self-contained loading machine designed for the handling of ores and similar material from the storage ground into cars. This loader consists of a substantial truck, upon which is mounted a pivoted carriage with elevator. The elevator has a vertical adjustment and is driven by a small compressed air or steam engine located upon the carriage. The buckets are arranged with open pans, which prevent spilling of the material while in operation.

The machine, of which the above is an illustration, is one that is used very successfully by one of the large ore companies in the Lake regions. The manufacturers, The Jeffrey Manufacturing Co. of Columbus, Ohio, will be pleased to give further data relative to this class of apparatus upon request.

Effect of Inclination.

From tests made by the Government Office of Road Inquiry the following table has been compiled, which shows the tractive force necessary to haul a load of one ton on roads of the best macadam on the grades given. The table also gives the equivalent length of each mile of grade in miles of level road:

Rate of inclination.	Angle with the level.	Tractive force, pounds.	Equivalent length of level road in miles.
.....	0 1 11	..	....
Level	0 00 00	38	1.00
1 in 500	0 6 53	42	1.10
1 in 100	0 34 23	58	1.52
1 in 80	0 42 58	63	1.66
1 in 60	0 57 18	71	1.87
1 in 50	1 08 16	78	2.05
1 in 40	1 25 57	88	2.30
1 in 30	1 54 37	104	2.73
1 in 25	2 17 26	118	3.10
1 in 20	2 51 21	138	3.63
1 in 15	3 48 51	171	4.50
1 in 10	5 42 58	238	6.26

THE level of Great Salt Lake, Utah, is reported to be steadily falling on account of the large volume of water tributary to it, which is now absorbed by irrigation enterprises. The Jordan and Bear rivers, City creek and other tributaries rise in the mountains to the east, and before they were intercepted by irrigation ditches poured into the lake the year round about 10,000 cubic feet a second. It is interesting to to learn that a similar condition now exists in the Dead sea, Palestine. The sea was formerly much larger than at present, as is shown by the old beaches, stretching at various levels along the basin. Since the middle of the century its level has been very slowly rising, till quite recently, but now it is falling. This shrinkage of Great Salt Lake is not due to natural causes, but to the increasing quantity of water taken from the Jordan and smaller streams by farmers, who are diverting all they can get to their lands. Some of the salt deposits covering the bottom of the lake may now be seen above the water n shallower places and near the shores.

Profits of Copper Mining.

In the following table the production of the Anaconda, Montana and Parrot companies is estimated, but in each case the estimate is based on statements of fact and deductions made by good authority:

	Product 1899, in pounds.	Dividends paid in 1899.	Profit per lb. copper.
Anaconda	121,345,398	$ 3,900,000	3½c
Calumet	88,901,133	10,000,000	11⅛c
Montana	60,000,000	5,400,000	9 c
Parrot	13,000,000	896,375	6⅞c
Quincy	14,301,182	950,000	6⅝c
United Verde	43,390,590	3,000,000	6⅞c

—Boston News Bureau.

AT Milwaukee, Wis., on the 19th, the third convention of the International Mining Congress opened with several hundred delegates present. B. F. Montgomery, of Cripple Creek, Colo., in his annual address reviewed the history of the congress up to the present session and recommended a permanent organization to meet annually. He recommended action looking to the thorough revision of the Federal mining laws to the end that mining on the Government domain should be controlled exclusively by the laws of Congress and not left to the regulation of enactments of statutes by the several States, thus producing a uniformity of method of location, size of mining claim, and annual assessment work by which a claim should be perpetuated until a patent should issue. Such legislation, he said, should be based upon the idea of inducing development of mineral wealth upon the public domain. He argued also in favor of the abolition by Congress of apex rights, or the right to follow a vein or lead on it into the land of an adjoining owner, and as a substitute for the apex rights now existing an enlargement of the location, requiring that each claim shall be circumscribed by the surface lines of said claim drawn vertically downward. He urged action to induce Congress to pass the bill to create a department of mines and mining like that of the Department of Agriculture, with a secretary, who should be a member of the President's Cabinet, and contended that the department should not be made a mere bureau to any other department, as it was now in the Department of the Interior, because then, as now, it would be treated as a matter of inferior and not of paramount importance to the country.

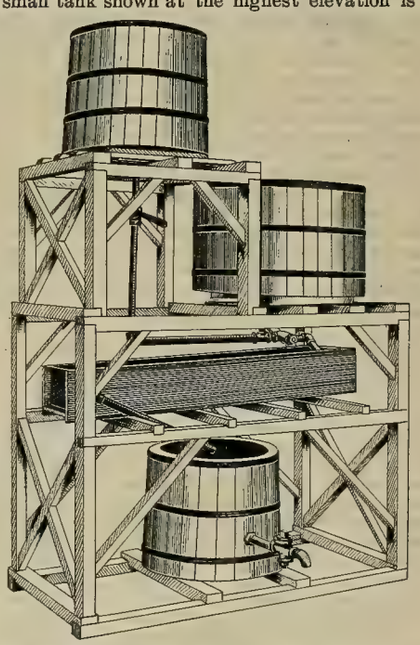
THE fourth annual convention of the Pacific Coast Electrical Transmission Association was held on the summit of Mt. Tamalpais, Marin county, Cal., on the 19th and 20th inst. On the first day the following named were elected as officers for the ensuing year: President, Prince Poniatowski; vice-president, Dr. Charles Van Norden; treasurer, William Angus; secretary, George P. Low; executive committee, C. P. Gilbert and E. J. de Sabla. The following named technical papers were read: "Arc Lighting for Interior and Street Service in Connection With Power Transmission Plants," H. W. Hillman; "The Choice of Alternating Current Motors," R. S. Masson; "Application of Storage Batteries to Transmission Systems," C. O. Poole; "Atmospheric Electricity With Particular Reference to Transmission Lines," Alexander G. McAdie; "Rate Indicators," Howard Hendrickson; "Factors Which Determine the Water Supply of California," Marsden Manson; "Transformers," H. C. Wirt; "Regulation Affecting Power Transmission Plants," Dr. T. A. Perrine. On the 20th was read a paper on "Transmission System Regulation," by C. E. Cory.

Natural History Collection.

The Carter collection of specimens of Rocky mountain birds and wild animals at Breckenridge, Colo., has been purchased by the Colorado Museum and Library Association, and is to form the basis of a public museum at the city park in Denver. The collection was make by Prof. Carter, a naturalist of note, and comprises hundreds of mounted specimens of birds and animals peculiar to the region named. The removal to Denver was made recently, there being six carloads of specimens. WASCOTT.

The Cost of Machine Work.

The question as to the "cost" of a machine, or of the product turned out by it, involves a number of items, at least one of which is frequently too little considered. Of course, it is well known that when a new machine is once put into service it immediately becomes "second-hand," thus entailing an immediate loss in market value. The longer the machine is in use, and the less carefully it is treated, the more rapidly it depreciates, and the extent of the depreciation, whether it be much or little, must be considered in estimating the value of the machine.



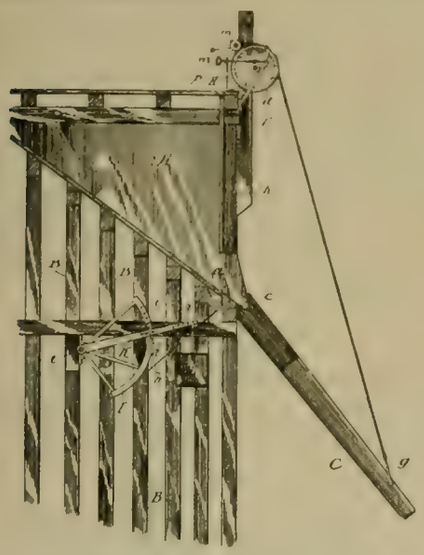
There is, however, another item which in many cases is of even greater importance. A manufacturer obtaining a new machine, especially if it is designed for some work for which there is a limited market, stands, in these days of rapid improvement and development, face to face with the question: "How long before the machine must be supplanted by a better one in order that I may compete in cost of product with others who may at some time obtain a more efficient machine for doing the same work?" In other words, what is the percentage of the hazard of being compelled to abandon the machine and procure another of later improvement in order that he may maintain his market, or may continue to make a profit on his manufactures?

Even the most casual glance at the history of special machinery, as employed in American manufactures, for example, during the past two or three decades will show that this "risk," as insurance people would term it, is by no means a small one. It is a question if the majority of standard machines can be used profitably for a period of twenty years, even if maintained in a perfectly efficient condition. Indeed, it is a question if any machines, in such a sense, are strictly standard.

A somewhat extended observation in this line leads the writer to believe that ten years is, at the present time, a high average for the life of automatic machinery generally, when considered from this point of view. Suppose, for instance, a manufacturer has the opportunity of obtaining a special machine ten years old for an extremely low price, or of obtaining a relatively high price for the latest improved machine for the same purpose, which one is the best for him to buy? Usually the latest and best will be found the cheapest. A small advance in output, quality and economy of labor more than offsets a very large difference in first cost.—Francis H. Richards in Cassier's Magazine.

Small Cyanide Plant.

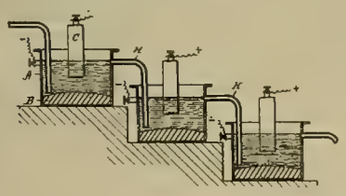
The cut herewith illustrates a design for a small cyanide plant, having a capacity of 100 pounds of ore. The small tank shown at the highest elevation is to



be used as solution tank, the tank just below it being intended for leaching tank and is fitted with false bottom and duck filters. The zinc box shown below the leaching tank has six compartments and is fitted with wire screens ready for use. The lower tank is the sump tank, which is provided with an outlet which facilitates the drawing off of the weakened solution to be transferred to the solution tank again where it is made up to full strength. The pipe connection between the different tanks has been studied out by the designers, John Taylor & Co., 63 First St., San Francisco, who furnish the device. There is a stop cock just below the solution tank and a similar stop cock between the outlet from the leaching tank and the zinc precipitating box. The solution enters the leaching tank through the bottom and is drawn off through the same pipe; to facilitate the discharging of the leached tailings a union connection will be found just below the leaching tank.

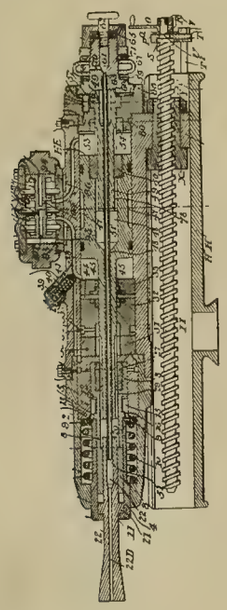
Mining and Metallurgical Patents.

Patents Issued June 12, 1900.



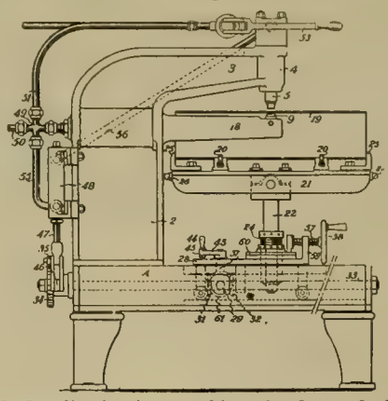
Specially Reported for the MINING AND SCIENTIFIC PRESS.

COUNTERBALANCED CHUTE.—No. 651,333; L. J. Anderson, Escanaba, Mich.



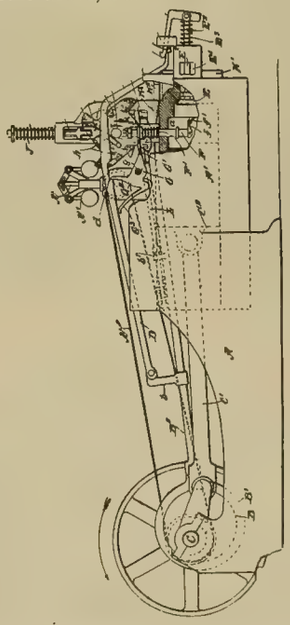
The combination of hopper bin for material provided with discharge opening at lower portion, discharge chute pivotally secured to hopper bin at discharge opening, winding shaft, primary winding drum on shaft, cable connecting primary winding drum with discharge chute at free end, second winding drum of relatively smaller diameter than primary winding drum secured to winding shaft, segmental pivoted lever having periphery eccentric with pivotal point, cable secured to second winding drum and to periphery of segmental lever, counterbalancing weight adjustable in relation to pivotal point of segmental lever, and movable support for weight on lever for adjusting weight properly to assist in raising and lowering discharge chute and counterbalancing chute by shifting position of support between weight and lever.

PRODUCTION OF CHROMIUM OXIDE.—No. 651,396; E. A. G. Street, Paris, France.



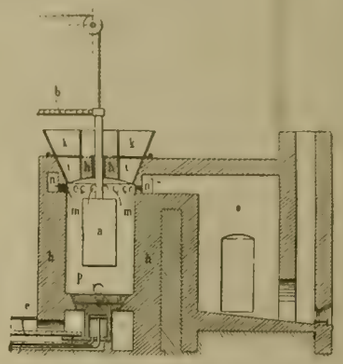
Process of manufacturing chromium hydroxide from solution of alkali metal chromate or bichromate consisting in passing electric current from suitable anode through solution to mercury cathode while temperature of solution is maintained at about 70° C.

ROCK DRILLING ENGINE.—No. 651,487; J. G. Leyner, Denver, Colo.



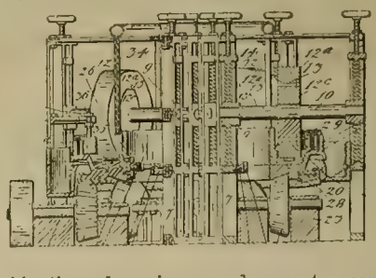
Rock drilling engine, combination with cylinder, cylinder head and piston, of drill bit arranged to be struck by piston and having lugs, shoulders or projections adjacent to shank end, drill-holding chuck containing axial bore adapted to receive shank of drill bit and lateral recesses radiating from bore adapted to receive lugs of drill bit; sleeve rotatably mounted on chuck extending beyond end of cylinder head far enough to be grasped by hand of operator, and containing flanged end extending down over end of chuck; oblong aperture in end of chuck sleeve arranged to admit shank and lugs of drill shank to pass through flange into chuck, when chuck sleeve is manually turned to bring its drill shank receiving aperture in line with chuck's drill shank receiving aperture and having chuck sleeve arranged to be partially rotated manually on chuck after drill shank is admitted to chuck to position in which drill shank receiving aperture will stand crosswise or at substantially right angles to drill shank receiving aperture of chuck, and means including stops or abutting surfaces for locking chuck sleeve's drill shank receiving aperture in its crossed or right-angled position relative to drill receiving aperture of chuck.

HYDRAULIC RIVETING MACHINE.—No. 651,503; S. Foreman, Sacramento, Cal., assignor to the Shaw, Ingram, Batcher Co., same place.



In hydraulic riveting machine, fixed mandrel and standard from which it projects and is supported, fluid pressure ram mounted upon standard and riveting tool carried thereby, second riveting heading tool mounted upon end of mandrel in opposition to that carried by the ram sleeve or socket concentric, movable with relation to interior tool, vertically moving plungers fitting in cylinders upon each side of heading tool, having upper ends adapted to support opposite sides of socket piece or sleeve, pipe or passage opening into cylinders and connecting with source of fluid pressure supply, whereby the plungers are simultaneously raised and sleeve forced above level of riveting tool, so that the plates to be riveted are first compressed together between exterior riveting head and interior yielding sleeve, and latter is afterward forced down by superior pressure of ram to allow rivet to be headed between two tools.

VALVE GEAR FOR GAS ENGINES.—No. 651,683; C. Werner, Pine Grove, Pa.



Gas or explosive engine, having separate gas and air admission valves, exhaust valve and firing pin, exhaust valve, air admission valve and firing pin being spring held in inoperative positions, main valve operating rod having reciprocative connection with engine as by an eccentric, auxiliary rod operated from main rod by tappets and operating gas admission valves, pivoted lever connected with exhaust valve to open it, star or cam wheel adapted to actuate lever and exhaust valve, toothed or ratchet wheel connected with wheel or cam and having double its number of teeth and adapted to be engaged by end of main valve operating rod to be turned thereby, pivoted firing pin operating lever having upwardly projecting arm, toothed arm or bar secured to air admission valve, rod connected with main valve operating rod adapted to be engaged by extension of exhaust valve operating lever to be raised and lowered, rod passing over firing pin operating lever having shoulder or projection adapted to engage arm thereof to operate it on outward stroke, outer end of rod dropping downward and having hook or tooth adapted to engage tooth upon arm which is secured to air admission valve.

METHOD OF ELECTRICALLY TREATING ORES OF NICKEL, ETC.—No. 651,718; H. Leleux, Paris, France.

Method of electrically treating nickel, cobalt, silver, lead and copper ores, for obtaining required metal without preliminary roasting or fusion, consisting in placing ore to be treated in contact with electrodes of metal whose heats of combination with non-metallic constituents of ore which contains metal to be liberated are higher than the heats of metal to be liberated, and then passing through electrodes and ores, electric current acting only as source of heat for bringing ore to such temperature as to cause suitably chosen metal of one of electrodes to unite, by exothermic reaction, with metals that are associated with particular metal to be liberated.

PULVERIZING MILL.—No. 651,798; J. H. Elspass, Pueblo, Colo., assignor of one-half to R. Hughes, Denver, Colo.

Combination of an inner and an outer series of posts, an annular revoluble mortar located between two series of posts, shafts journaled in spring-supported boxes mounted on posts, pulverizing rolls fast on shafts and engaging mortar, circular guide track mounted on inner series of posts, ring mounted on mortar and engaging track, ring and track being provided with interlocking flanges, annular amalgamating trough surrounding mortar and adapted to receive discharge from mortar, conical rollers engaging corresponding track formed on bottom of mortar, gear fast on bottom of mortar, and operating gear engaging mortar gear.

PRECIPITATION OF PRECIOUS METALS FROM CYANIDE SOLUTIONS.—No. 651,509; F. W. Martino and F. Stubbs, Sheffield, England.

A process for precipitation of precious metals from aqueous cyanide solutions, consisting in treating such solutions with acetylene and precipitating metals in metallic state; passing acetylene and atmospheric air through such solutions; addition of calcium carbide to aqueous cyanide solution to produce acetylene in nascent condition.

TREATMENT OF ORES AND PRECIPITATION OF PRECIOUS METALS FROM THEIR CYANIDE SOLUTIONS.—No. 651,510; F. W. Martino and F. Stubbs, Sheffield, Eng.

Process for precipitation of precious metals from their aqueous cyanide solutions, by treating such solutions with hydrocarbon gas produced when metallic carbide is decomposed by water, and capable of precipitating metals in metallic state, addition to aqueous cyanide solution of metallic carbide decomposable by water to produce hydrocarbon gas in nascent condition.

Cœur d'Alene, Idaho, Silver-Lead Mines.*

Near Wardner, the Bunker Hill & Sullivan employs about 450 men, daily extracts 750 tons of ore and runs nearly all through its concentrator—the largest silver-lead concentrating plant in the world—after carrying it 1¾ miles over an aerial tramway. A tunnel running directly under that tramway is more than half completed, and, when done, the cars into which the ore falls from the chutes in the mine will dump it directly into the bins at the mill. The tunnel will reach the ore 700 feet deeper.

Alongside the Bunker Hill & Sullivan is the Empire State-Idaho Mining & Development Co., with shipments of sixty tons of concentrates daily. Northwest 2 miles is a gulch to the O. R. & N. Cœur d'Alene branch, and from the side of that gulch a tunnel has been started to reach the ore over 700 feet below the level of the present working, the diamond drill boring to the level of the 700-foot and 300 feet farther, the vein showing better ore at that depth than has been found above. The railroad company will build a spur to the tunnel. The mining company has begun work to flume the South Fork from Wallace to the mouth of Big creek, where will be erected a large concentrating plant.

The Tiger & Poorman was recently sold to the Buffalo Hump M. Co. With a diamond drill was discovered a parallel shoot 200 feet to the south, in which 8 feet of ore has been opened up 500 feet. The diamond drill opened this shoot on every level from the 100 down to the 1300. At the same time the shaft was sunk from the 1500-foot level down to the 1600, and when the crosscut was run to the vein the ore body was found to be 16 feet wide. The superintendent estimates that it could be profitably worked down 3000 feet deeper.

In the Hecla, at Burke, the tunnel is being enlarged to permit the handling of ore in large quantities, and a concentrator at Gem is being overhauled for the company's use.

At the Black Bear & Frisco the lowest level which has been opened up is 1000 feet below the collar of the shaft, 1600 feet below the highest point where ore was mined. On that level, reached by a tunnel nearly half a mile long, before coming to the shaft, is located a pump in a station 40x60 feet, cut in solid rock, with the ability to lift 5000 gallons water each minute 1000 feet above. It cost $25,000 at the factory.

At Mullan are the Morning and Hunter. The Morning is the largest deposit of low-grade ore known in the Cœur d'Alenes, with the exception of the Bunker Hill & Sullivan. It employs nearly 400 men and handles 800 tons of ore daily. The mine and mill are connected with a narrow gauge railroad. The company is building an air compressing plant a mile below the concentrator, to be the largest plant of that kind in the district.

The Hunter resumed shipments last winter, after being closed down for a year and a half on account of its concentrator being burned. During that time, however, a shaft was started from the level of the old tunnel, and at a depth of 200 feet the ore shoot has been crosscut where it was 40 feet wide—more than double the amount it had ever shown before. With sixty-five men on the payroll, the company is mining and concentrating 200 tons of ore daily; the concentrates run 50% to 55% lead, with sixty to eighty ounces silver.

The following estimates represents the number of men employed and the shipments of ore:

Mine.	Men Employed.	Daily tons Shipped.
Bunker Hill & Sullivan	450	125
Empire State-Idaho	125	60
Government Gulch	25	10
Buffalo Hump	175	75
Standard	225	100
Mammoth	100	40
Hecla	75	30
Morning	375	110
Hunter	65	35
Sixteen to One	75	35
Frisco Con. Co	200	100
Total	1,890	720

Although one of the oldest mining districts in the Northwest, the Cœur d'Alenes are new, considered from the standpoint of development. In the early days in the silver-lead belt mining was not profitable; freight on ore was high, as were the charges of the smelters; machinery was expensive, and the concentrating of such ores was a new undertaking, and so crude were the methods that had the tailings of that day been saved they would have paid well for milling again under present methods. In 1892 came the first labor troubles of the district, and no sooner were they partially settled than there came a sudden drop in the price of silver, followed soon after by a similar decline in lead quotations. Every outlook was gloomy, and, while the mines well opened up and supplied with the necessary machinery could better afford to continue operations than to close down, at the same time there was little encouragement to the miner to open new ground, with its certainty of heavy expense and only probability of returns. Each week and month saw a further decline in the values of the product, and but that American genius kept step with this decline by the invention of new and more economical ways of mining and milling, every mine in the camp would have been compelled to close down, as some of them did.

Development work is now in progress on more claims than in the entire previous history of the camp; from those previously developed there will this year be shipped 150,000 tons of concentrates, worth over $12,000,000. The two illustrations and much of the statistical material are furnished through the courtesy of Mr. Frost, the enterprising editor of the Wardner News.

*See illustrations front page.

Explosive Compounds and Rock Blasting.

TO THE EDITOR:—The State Mining Bureau, among other publications, has issued four bulletins that have been highly appreciated by practical miners: Bulletin No. 2—"Methods of Mine Timbering," by W. H. Storms; Bulletin No. 5—"The Cyanide Process," by Dr. A. Scheidel, E. M.; Bulletin No. 6—"California Gold Mill Practices," by E. B. Preston, M. E.; Bulletin No. 9—"Mine Drainage," by Hans C. Behr, M. E. The issuance of concise and condensed information relating to any of the special branches of practical mine working is a most excellent idea, and in no other way can the State Mining Bureau be of greater service to miners than by continuing to follow the policy so happily inaugurated. That these small volumes are eagerly sought and appreciated is a well-known fact. They can be found in the office of nearly every mine, and it is a common thing to find them in the kit of the miner—the man who swings the pick and the hammer.

The best way to advance the mining industry is to prosecute mine operating along the most intelligent and approved lines, by the application of methods which, growing out of the judicious combination of scientific research and practical experience, have proven the most successful. These methods are to be found generally in standard treatises, many of them high priced and difficult to obtain, to which the ordinary miner has no access.

Now there is one department in every mine that ranks foremost in importance—that is, drilling and blasting—the breaking and extracting of the many different kinds of rock in the many different structural formations by the most advantageous methods. In this particular branch of mining there is a wide diversity of practice and belief even among so-called good miners, some of whom derive their ideas from observation and personal knowledge, while others derive theirs from tradition, popular fallacy or other erroneous source. Still others have very vague ideas, if any, of accomplishing their tasks in the manner most intelligent and effective.

It therefore seems certain that the publication by the Bureau of a bulletin devoted to "Explosive Compounds and Rock Blasting," as applied to mining, would meet a long-felt want and be appreciated not only by miners, but by superintendents and mine owners as well. It should embrace a description of the general character of explosives most commonly used and how to handle, care for and apply same, also how to locate holes in different positions to secure best results.

The preparation of such a bulletin would not of necessity involve a great amount of original effort. The bulk of the matter desired could be compiled from recognized authorities found in the libraries of the State and the University, as well as in the private collections of some mine experts, and no doubt the manufacturers of the various explosives, if asked, would cheerfully contribute much desired information.

This suggestion is advanced in this open manner in order that it may receive additional support and indorsement, which will tend to give it greater weight with the Bureau, and therefore bring about more speedy consummation. W. G. SCOTT.

Shasta, Cal.

Process of Hardening Steel.

The following is a new use of cyanide of potassium as given in the specification of a patent issued to a resident of Magdeburg, Germany:

"The piece or part of steel to be hardened is first coated with a protecting mass that is able to resist the heat, and thereafter cyanide of potassium is strewn upon that coating, whereupon the whole is put into the fire. The piece or part thus treated is then quenched. The object of the coating is to render the effect of the cyanide of potassium as uniform as possible, and I prefer to continue the application of the last-named substance after the steel, with its coating, is exposed to the fire; but instead of using only cyanide of potassium I use a mixture of this substance with coarse salt. By treating the steel in this manner I obtain in the same a very uniform structure, which is not in the least changed when the steel is cooled down. This feature is particularly important in the case of machine parts and the like.

"The coating consists generally of purified chalk and varnish; but the chalk may well be replaced by clay, oxide of zinc, and other substances that do not burn down in the fire. The oxide of zinc may be mixed with file shavings of lead, when a solid crust will be obtained, resulting from the melting of the lead.

"When the steel to be hardened, after having been coated with the protecting mass, is heated, together with this mass, the varnish, that merely forms a kind of a cementing medium, burns and a hard, porous cover remains. During the further heating of the steel with this hard, porous cover the cyanide of potassium strewn upon that cover passes into and through the pores of the latter and distributes its action uniformly upon the surface of the steel, because the pores are uniformly distributed over and through the said hard cover formed by or resulting from the protecting mass.

"When using a mixture of cyanide of potassium and coarse salt, both substances are employed in pretty equal quantities, and the quantity of the whole mixture is, of course, dependent upon the size of the pieces or parts of steel to be hardened, or of the extension of the surfaces of same, respectively."

Second-Hand Machinery.

TO THE EDITOR:—While in your editorial in the issue of June 9, concerning second-hand machinery, there is a great deal to commend we regret to see that the whole tone is against the use of second-hand machinery.

I will admit I am in this business and my views may be prejudiced to a great extent, yet the facts in the case will, I think, bear me out in what I have to say in opposition to your views.

In the first place the man who is about to buy second-hand machinery should be himself, or have at his disposal, a man capable of telling the condition of a machine upon examination. I do not say this meaning that all second-hand machinery men are disciples of Ananias, for I do not think that prevarication is any more common with them than with the original seller; but that the purchaser be satisfied in his own mind that the condition is as it is represented. The second-hand man must be a mechanic to be successful in his business; the better mechanic, the better and more prosperous business. He must be able to tell the capacity of a boiler to-day, the number of revolutions an engine should make to-morrow, the capacity of an air compressor the next, the quantity of gas produced by a gas producer, and so on throughout all his stock. He must be able to tell this from facts and experience, if he is a success in his line. It is not the same story with him every day that it is with the man who has one special line and learned his story well. We are all liable to be mistaken, and if you satisfy yourself as to the capabilities of the article in question you are bound to be right.

While, perhaps, in many shops there are articles of machinery that could be well put in a collection of antiques, yet I think that 90% of the machinery in second-hand stores is modern. Whatever there is a demand for is that which the second-hand man is more eager to buy. The time when a thing was bought because it was "cheap" has gone by, as the up-to-date man has found that modern machinery and supplies are the sellers, not the cheap things of times gone by. Look back for a few years and see for yourself the failures which have been made in the mining industry and you can realize the possibilities of placing modern material in your warerooms. Where single machines were bought years ago, you will find the second-hand man looking for and purchasing entire plants which for some cause have been forced to close their works.

If a manager can find the machine he is looking for and satisfy himself as to the condition of it, I claim that it is economy, and I mean it in the same term you use it in your editorial. The day when "cheap" was the criterion of dealers is gone, and now it is "how modern, how good, how long used."

The most erroneous idea in connection with the second-hand business is that the poor man, the man with small capital, is the mainstay of the business. Such is furthest from the actual fact. In New York City, last month, was placed an order for over $20,000 worth of second-hand material and machinery by the largest smelting and mining company operating in North America. The largest buyers of second-hand material in Colorado are the largest and wealthiest mines in the State. Take, for instance, second-hand pipe. Dealers do not claim that the life of it is as long as new, but the question is, Is it not long enough to outlive the life of the drift or stope where used? It would be as reasonable to say that it was not economy to take out pipe from one drift and place it again in another, as to say that new pipe would be cheaper to use than second-hand.

In conclusion I would say, do not discourage the purchase of second-hand machinery, but rather urge careful and well-inspected purchases in this line. A machine that cost $1500 when new and is offered at $100 shows on the face that there is something the matter with it. A good second-hand article has a value as well as a new one, and the price is the dealer's judgment as to its condition. Yours very truly,

GEO. G. MORSE, Pres. The S. H. Supply Co.

Denver, Colo., June 13.

MINING SUMMARY.

ALASKA.

(Special Correspondence).—The Yakima mine lies about a mile back of the southern end of the Treadwell system of mines on Douglas Island, at an elevation of 600 feet. At this elevation there is quite a flat well timbered, and at the upper end of the flat is the mine hoist and shaft, and towering far above to the westward the timber clings to the mountain sides, and then above the timber line the bold mountain tops of the center range of the island appear partially covered with snow. The mine is a consolidation of several claims and is operated by the More Investment Co. of Seattle. It is claimed that the ore body is 600 feet wide, runs nearly east and west and dips to the north at an angle of 70°; the bedrock is slate. There is a nice hoisting plant with an air compressor to run a machine drill. The shaft is sunk to a perpendicular depth of 170 feet. At this depth a crosscut is being run in the ore body and is nearly 300 feet in length; it is to be run till the hanging wall is reached. Some of the quartz on the dump is heavily sulphuretted and carries lead, a metal which is not found in the Treadwell ore.

Douglas Island, June 10.

The Cape Nome Gold Digger of the 30th ult. says that at Topkok there are forty tents, one saloon and 120 men. They took out some big money down there, but the claims are played out now. A big strike is reported 20 miles below Topkok and the miners are stampeding there now. W. W. Cardwell in that part of the coast worked two hours on the beach and reports that he saw a miner clean up $1100, and also that the men brought to camp sacks containing 2500 ounces of gold, worth $40,000. He says that three men took out $100,000 from a piece of ground 60x100 feet in size. Each claim was 20 feet wide, but the whole "shooting match" was only 300 feet long and is now substantially worked out. The beach there has produced in the last few weeks from $300,000 to $400,000.

The A. C. Co. has secured the big black bluff near the beach workings. It is said to be full of gold.

Three hundred men are at Bluff City and in the vicinity, poorly equipped with tools and supplies.

With the rich ground there is, of course, much that is poor. Some men, other than the lucky ones alluded to, make $10 or $12 a day, and others are unable to make more than $4, $3 or $2.

Over 500 men left Nome during the last week or ten days to work in various places—Anvil, Glacier, Snow and Dexter creeks. Others have struck out for Penny and Cripple rivers, the Kougrok and elsewhere to prospect, some on creeks and others along the ocean shore. Topkok and Bluff City have taken away a good many, while others have gone to the Golovin and Denbigh districts.

The mines of Anvil, Snow and other creeks are making a steady output of gold. Sluicing is going forward right along.

From now on to July 10 the vessels will have a hard time of it getting through the ice. The ice from Norton sound is gradually being blown out and is breaking up, and the vessels, instead of having a clear passage, will be compelled to cut their way through the floe.

The Alaska civil code bill has been signed by the President. The provisions of the law covering mines and mining claims located on the beach of Bering sea are as follows:

Section 26. The laws of the United States relating to mining claims, mineral locations, and rights incident thereto are hereby extended to the district of Alaska: Provided that, subject only to such general limitations as may be necessary to exempt navigation from artificial obstructions, all land and shoal water between low and mean high tide on the shores, bays and inlets of Bering sea, within the jurisdiction of the United States, shall be subject to exploration and mining for gold and other precious metals by citizens of the United States, or persons who have legally declared their intention to become such, under such reasonable rules and regulations as the miners in organized mining districts may have heretofore made or may hereafter make governing the temporary possession thereof for exploration and mining purposes until otherwise provided by law: Provided, further, that the rules and regulations established by the miners shall not be in conflict with the mining laws of the United States; and no exclusive permit shall be granted by the Secretary of War authorizing any person or persons, corporation or company to excavate or mine under any of said waters below low tide, and if such exclusive permit has been granted it is hereby revoked and declared null and void; but citizens of the United States or persons who have legally declared their intention to become such shall have the right to dredge and mine for gold and other precious metals in said waters below low tide, subject to such general rules and regulations as the Secretary of War may prescribe for the preservation of order and the protection of the interests of commerce. Such rules and regulations shall not, however, deprive miners on the beach of the right hereby given to dump tailings into or pump from the sea opposite their claims, except where such dumping would actually obstruct navigation; and the reservation of a roadway 60 feet wide, under the tenth section of the Act of May fourteenth, eighteen hundred and ninety-eight, entitled "An Act extending the homestead laws and providing for right of way for railroads in the district of Alaska, and for other purposes" shall not apply to mineral lands or townsites.

ARIZONA.

COCHISE COUNTY.

The South Bisbee is to be developed on a larger scale. A contract is let for a shaft 600 feet deep, one-quarter of a mile from the South Bisbee hoist. The formation of the South Bisbee mine is changing with development from lime-rock hardness to a broken formation containing clay and black manganese.

Fire destroyed part of Pearce on the 17th. Oil was being used instead of coal for fuel. The tanks where the oil was stored became ignited and exploded, scattering fire. The Commonwealth mine buildings were nearly wiped out. At the shaft house the man at the hoist stuck to his post in spite of the flames. The fire reached him as the last man came out. A 50-stamp mill is a total wreck; loss, $100,000. Cessation of work is but temporary, as the mill will be immediately rebuilt.

GRAHAM COUNTY.

A report on the Shannon mine near Clifton recommends an increase in the capitalization and sale of treasury stock, enabling the company to put in machinery.

MOJAVE COUNTY.

In the main shaft of the Silver Age, at Chloride, the vein is large; besides gold, silver and lead the ore carries 8% copper.

Near Chloride the Elkhart mine and 100-ton concentrator have started up. Thirty men are employed.

Manager Timmons of the Payroll mine has let a contract for 300 feet of crosscutting and drifting at the bottom of the 250-foot shaft.

PIMA COUNTY.

(Special Correspondence).—The Darius Green M. Co. is organized here; P. W. Fleming, secretary and treasurer. The company has placer claims in Pima and Santa Cruz counties and has patents on a new machine for extracting gold by the dry washing process.

Tucson, June 18.

PINAL COUNTY.

The Florence Blade says that seventeen tons of ore shipped from the Golden Quiver mine at Mineral Hill last week averaged at the smelter 52% lead.

YAVAPAI COUNTY.

At the Copper Chief, formerly known as the Equator, men are opening up the mine. Supt. Hendry has had experiments made of the cyanide process on the Copper Chief ore. It is locally reported a large cyanide plant has been ordered.

The Val Verde Smelter Co. is preparing to put in a pyritic smelter for treatment of siliceous ores. A dynamo will be put in to electric light the works.

CALIFORNIA.

AMADOR COUNTY.

The North Plymouth M. Co. has incorporated; capital stock $300,000, subscribed $7000; F. W. Voogt, J. Toman, J. K. Keeney, J. H. Spring, R. L. Cheney, S. Rosenheim, A. A. Frank, E. L. Wemple.

Democrat: Near Volcano, in three of the gravel mines the commuters are making $5 to $37 per day to the man. Recently in one of these a candle box of gravel yielded $45 and several pieces ranging in value from $5 to $25 were found.

Jackson Dispatch: H. Smith of London, England, managing director of the Exploration Co., Ltd., and F. W. Bradley, who has been appointed to succeed the late Capt. T. Mein in the management of the company's interests on the Pacific coast, have been examining the Oneida and are well pleased with the progress being made by Supt. Truscott. The framework of the new 60-stamp mill is up and the mortar blocks in place. At the old shaft the water has been lowered to the 1200-foot level. In the new shaft the upraise from the 2000-foot level has been completed through to the 1700-foot level. When this is completed there will be a continuous upraise from the 2000 to the 1500-foot level

BUTTE COUNTY.

A. B. Chambers will put a new quartz mill on Bloomer hill. He has a flume and ditch 11 miles in length to carry the water of Berry creek to the mine.

CALAVERAS COUNTY.

At West Point the Lone Star mine is to be sunk 300 feet deeper.

The Josephine mine is being worked.

Messrs. B. and L. Williams, formerly of the Copper Queen, Bisbee, Arizona, assisted by their old-time foreman, J. Ambrose, are unwatering the old Napoleon mine near Milton, four miles south of Copperopolis, and will reopen this old property. The Napoleon discovery was, practically, the first showing of copper in California. It was located in November, 1860, and at the time occasioned great excitement. In October, 1862, it was incorporated, each foot of the 2700 feet representing a share of stock and selling at $100 each. The Napoleon began shipping ore in May, 1863. The old books of the company show that in 1863 the mine shipped 1,172,165 pounds first class and 1,507,621 pounds second class ore. In September, 1864, it began shipping "concentrates" crude, after the manner of the day, the "concentrates" being thus prepared: A pit about 2 feet deep was cut in the soft soil, about 20 feet square, in which was laid four cords dry pine wood; over this was piled in a truncated cone 100 tons ore; the wood was fired and the mass burned for about six weeks, when the sulphur had well burned out: thus the ore was "concentrated." No ore going below 10% was shipped; all above 15% was "first class ore," from 10% to 15% second class.

The old workings, idle since 1865, will be unwatered by Messrs. Williams, and then a modern compartment shaft will be sunk. About $50,000 will be spent in putting this old property in shape to begin paying dividends again.

EL DORADO COUNTY.

Judge Bahrs of San Francisco will have work at the Little Gem mine, near Volcanoville, resumed.

J. F. Jones and W. G. Roberts have bought the Epps placer mine near Garden valley and bonded the Hart quartz mine adjoining. They are driving a tunnel that will tap the ledge. The Nugget says they intend to build a 20-stamp mill.

Nugget: In the Larkin mine, Diamond district, good ore is reported on the 400 and 600-foot levels. The 10-stamp mill is running night and day.——Work has resumed on the Griffith Con.——At the Ribbon Rock, Diamond district, E. A. Davis Supt., the shaft is down 200 feet.——The Boulder mine, on Webber creek, is working twenty-four men. The 20-stamp mill is running continuously.——Hill Bros. & Galt of this county are installing a three-drill air compressor at the Buena Vista mine, on Mathenas creek.——Eighty-five men are employed at the Blue Ravine gravel mine, near Mormon island.

KERN COUNTY.

Randsburg Miner: At the Searles Borax Works, D. Searles was given the option of running the works on his own hook, with the combine against him, or take a salary of $500 per month and stop; he chose the latter.

Bakersfield Californian: A 4½-inch pipe line is discharging a stream of oil at the Central Point and Section Four companies properties. They have a joint line from their wells to a tank three-quarters of a mile away. These two companies are producing 200 barrels per day.——On Jan. 1, 1900, any amount of land could be bought in the Kern river district at $250 per acre. Now $1000 is deemed a low price and the figure is nearing $1500.——The capacity of the refinery at Sunset is to be doubled. The plant now on the ground represents an investment of $25,000.

MADERA COUNTY.

(Special Correspondence). — The Lily mine has resumed work. One thousand cords of wood are being cut for the Waterloo mine. Ore is being hauled from the Standard mine to the mill. The Magnet Co. has begun the construction of its system of reservoirs at the head of Crystal falls.

Gold, June 20.

MARIPOSA COUNTY.

The Austin mill at Whitlock has begun crushing rock for Johns Bros.

NEVADA COUNTY.

C. W. Bonnemort, former Supt. Sierra Nevada mine, will reopen the Culbertson mine at Graniteville.

The Spanish Con. Q. M. Co. has levied an assessment of 5 cents per share, delinquent July 16th.

At Grass Valley the Mountaineer quartz mine was shut down this week, forty employes being laid off.

RIVERSIDE COUNTY.

D. T. Ulmer reports having found and filed twenty-two claims, each 600x1500 feet, 60 miles northeast of Salton.

SHASTA COUNTY.

The meeting of the Little Tiger M. Co. will be held at Charleston, West Virginia, June 26th.

The Gladstone gold mine at French Gulch is reported sold to J. H. Roberts, L. A. McIntosh and I. O. Jillson by J. H. Wolkotte. The development of the mine has been carried to a depth of 900 feet; there are 7000 feet of track in its tunnels.

SIERRA COUNTY

A quartz mill goes to the Osceola mine at Alleghany for a Los Angeles company.

SISKIYOU COUNTY.

At Redding the Scott Mountain M. Co. has incorporated; capital $500,000, $70,000 subscribed: F. P. Primm, J. W. Conant, T. B. Smith, J. J. Chambers, E. S. Watson; to work on Scott mountain, near the Shasta line.

TUOLUMNE COUNTY.

Near Sonora, at the Mazeppa, the shaft has been sunk 515 feet, at an average cost per foot of $19.65: 1134 feet of drifting, crosscutting and upraising has cost $8.25 per foot.

News Bureau: Treasurer Belches is still receiving the certificates of the Santa Ysabel G. M. Co. stock and the $1 installment on the same. About 115,000 shares have thus far been surrendered out of the total 130,000 share capital.

COLORADO.

BOULDER COUNTY.

At Ward, the B. & M. Co.'s new pump will allow shaft sinking from the 800-foot level to 1000 feet and more. Secretary Helbig says: "There has been expended $16,973.24 for general improvement and development work from January 1 to June 1, 1900, and shipments of ore have been suspended in order to sink the shaft on the mine from the 600 to the 800-foot level, run these levels into the ore bodies below and take out the old bucket way so as to remodel the entire shaft and operate a skip, which will more than treble the working capacity of the mine. This work will be completed by July, when shipments of ore will be resumed."

At Ward, G. E. Brinker is managing the Old Colorado property and is unwatering the shaft.

CLEAR CREEK COUNTY.

The Little Richard G. M. Co., at Idaho Springs, has its shaft 562 feet deep and proposes to utilize the water in Soda creek for lighting the mine workings and operating an electric hoist. G. W. Morgan is manager.

The Atlantic mine on Silver mountain and the company's mill on Clear creek will resume under the management of Mrs. E. C. Atwood.

DOLORES COUNTY.

At Rico, work on the Atlantic Cable group of mines operated by the New Jersey Zinc Co., is suspended and the miners paid off. The suspension was caused by a strike of the men for $3 per shift, instead of $2.50, which they were receiving.

GILPIN COUNTY.

Near Central City, Mgr. P. McCann of the Kansas-Burroughs Con. M. Co., in the Phœnix-Burroughs shaft, will go to a depth of 1200 feet. The company employs 150 men; its daily shipments average 125 tons.

LAKE COUNTY.

The Yak tunnel progresses 6 feet daily. The mules are to be superseded by horses.

The Yak M., M. & T. Co. are over 8000 feet on their tunnel.

SUMMIT COUNTY.

The Breckenridge Journal learns that the North American Gold Dredging Co.'s placer, on the Swan river, will be developed and that the dredger boat and hydraulic lift systems will be fully tested.

TELLER COUNTY.

(Special Correspondence). — The Colorado Springs & Cripple Creek District Railway Co. have two electric power plants—one at Lake Moraine, near Pike's Peak, and the other at Cameron, at foot of Bull hill. The generators at the Moraine station generate at 6660 volts, which are transformed down to 350 volts for the rotary converters at the Cameron station, the latter converting the three-phase alternating current to 500 volts direct current, for line work. At the Cameron station are two rotary converters, 200 K. W. each, and a 225 K. W. generator, which will be operated by steam power equipment at same station.

Cameron, June 13.

(Special Correspondence).—The Strong mine is closed down, pending the installation of new equipment and the building of new gallows-frame and shaft-house. The new hoist is a 20x40 inch, first-motion, Webster, Camp & Lane make; two new boilers are tubular and 260 H. P. each; the gallows-frame is of heavy Oregon pine timbers and will stand 60 feet above the surface; engines and boilers are being set in substantial masonry. The Strong shaft is now at a depth of 825 feet; when the new equipment is ready for work

sinking will be continued to 1000 feet depth.

Victor, June 14.

(Special Correspondence.)—The Detroit Mill: The milling plant of the Detroit Reduction Co., near Independence, Cripple Creek district, is now operating, under the superintendence of O. F. Barnes. The machinery for the mill was supplied by the Colorado Iron Works, and in design and arrangement includes some features of special interest. In general, the plan provides for fine crushing and pulverization, drying and pan amalgamation, the last-named being assisted by chemical and electrical action. The ore, passing through roughing rolls, is elevated to a three-mesh screen, below which is an automatic sampler. The material which is too coarse to pass the screen is returned to the crushers, that which goes through the screens dropping into a system of bins and thence to a revolving drier. From the drier it passes through a finer set of rolls, is elevated to an eight-mesh screen, thence to a set of narrow-faced, high-speed rolls, which reduce the ore to thirty and fifty mesh. From the high-speed rolls it drops into bins, and from them is fed to a specially designed pulverizer, consisting of a cylinder containing two discs, the latter revolving in opposite directions at the rate of 750 revolutions per minute, the result being to pulverize the material to about 150-mesh.

A pipe extends from the pulverizer upward about 7 feet, where the pipe expands into a large dust chamber, which is connected with a fan. Here a separation of fine dust is made from the coarse, the fine dust passing through a pipe into a centrifugal trap, in the bottom of which the most of the fine dust is precipitated. That which is not collected in the trap is drawn into a second dust box, from which the air is returned to the pulverizer, making a closed circuit, within which the dust is confined. Pipes also connect these dust chambers with the rolls and screens in the mill, the result being that the mill is quite free from the dust that is so frequently conspicuous and wasteful in a dry-crushing mill. From each dust trap a hopper lets the dust fall through pipes into the treatment pans; but attached to each hopper is a measuring machine, which automatically measures the quantity of material passing from the hopper.

There are eight treatment pans, each 8 feet diameter and 3 feet high; four are ranged in an upper row and receive the fine-mesh material in perfectly dry condition; but in these pans it is mixed with water and submitted to chemical and electrical action, which prepares it in about two hours' time for amalgamation in the other four pans ranged in a lower row. Each upper pan takes a charge of about three tons; when the treatment is complete in the upper pans the charge is drawn into the amalgamating pans. The pans are provided with steam jackets, by which the pulp is heated. Finally the tailings, or residue, from the amalgamating pans pass into settlers, thence over Bartlett concentrating tables, where a concentrate saving is made and where such mercury is caught as may have escaped from the settlers. The mill is capable of treating from 80 to 100 tons of ore per day. The stockholders, principally, are Detroit men.

Independence, June 15.

(Special Correspondence).—As has been noted in the daily press, the Secretary of the Interior has ordered a reopening of the Hull City placer case, involving the government patent to grounds of the Independence Town & Mining Co. at Independence, Cripple Creek district. This ground was taken originally as placer claims, and in the contest fought out a year or two ago the Commissioner of the General Land Office decided against the Independence T. & M. Co. and held the claims subject to cancellation, but was reversed by Secretary of Interior Bliss and patent was issued. Present Secretary Hitchcock has reviewed the case and supports the rulings of Commissioner Hermann. The property in question possesses equipment, buildings and improvements worth about $50,000. The mine is well developed and has been a rich producer for the past two years. Pending the forthcoming litigation, it is likely that a receiver will be appointed and the mine operated.

Victor, June 16.

(Special Correspondence).—The Eagle Ore Sampling Co. has been organized, with E. F. Holden, president: J. C. Jenkins, treasurer; J. Key, vice-president; W. O. Jenkins, secretary; N. Franklin, general manager. A new sampling plant of 300 tons per day capacity is nearly completed, its location being on the southern slope of Battle mountain, near Goldfield. They expect to be operating by the middle of July. The method of handling the ore will be entirely automatic, the plan of building and arrangement of machinery having special regard for that object. This sampler runs its trackage, having about 3000 feet, and can connect with the F. & C. C., the M. T. or the new Colorado Springs line. Manager Franklin was several years in charge of the State ore sampler at Blackhawk, Colo.

Goldfield, June 16.

Special Correspondence). — The June output of Cripple Creek ores will not be up to the general average for the district. It is not expected to reach over 40,000 tons. The falling off appears to be in milling ores rather than smelting, which indicates a readiness to ship high grades principally. This month seems to be set apart for repairs, new equipment, reorganization and a general curtailment of production to get ready for work under different arrangements.

No one familiar with the district has failed to observe the progress of consolidation which has been such a marked feature during the past year. This tendency appears to gather momentum as time advances and is rapidly transforming the district of hundreds of individual mines into a district of a dozen great groups of mines, controlled by that number of powerful syndicates. It is pending these consolidations that production is curtailed. It is not to be doubted that the eventual result will be a greatly increased tonnage and a better systematized industry, but that it will minimize and restrict the opportunity of the individual or the company with small capital there remains no question. The developments of the district to a great degree have been accomplished by lessees and leasing companies, but the growing tendency has been to discourage this class of operators by making terms of lease shorter and conditions more difficult.

The mines controlled by the Woods Investment Co., the Stratton-Independence combination, the Isabella, Portland, Elkton Consolidated, Mary McKinney, Vindicator, Lillie, Strong, Victor, Independence T. & M. Co., Union, Lucky Gus, Anchoria-Leland, and a few others, produce the great bulk of district ores and a few of these have been acquiring additional territory in the district at a great rate within the past year.

However, the erection of new reduction plants still goes on, and when the characteristic Cripple Creek energy shall be directed to the production of low-grade ores there will be facilities for treating a tremendous tonnage. Besides the five or six mills in the district, the one at Colorado City and three at Florence, all dependent upon Cripple Creek ores, an additional plant, known as the Milliken mill, is being pushed to completion at Florence, and will have a capacity of about 600 tons. The Rocky Mountain smelter is also to be erected at Florence. It will be designed for general work and it is said will be partly on the same plan as the Bi-metallic at Leadville. WASCOTT.

Cripple Creek, June 16.

W. S. Stratton has secured the property which belonged to the Chicago-Cripple Creek Co. before the insolvency of that corporation for $85,000.

The Victor correspondent of the Republican notes that one of the results of the consolidation movement in progress will be to enlarge the prospecting field of the district, by sending the companies which have been selling their inside holdings out to the outer rim of the properties, in order to retain their existence. The men with cash to pay are taking up the undeveloped claims in the heart of the district and driving idle companies either out of existence or to outside hills. The rapidity with which the valuable territory is passing into the hands of large operators indicates that it will not be long until it will be rarity to find a company with less than 40 acres retaining a foothold on any of the big hills. The trouble has always been that there was too much good ground lying idle in the vicinity of big mines, to allow the outer hills any chance for attention, but with such territory passing into the hands of rich companies, besides being thoroughly exploited, the opportunity of the outer hills arises.

The Greater Gold Belt M. Co. have ratified the sale of the Badger Boy claim to C. W. Kurie for $95,000 net. The directors have declared a 2-cent dividend, $75,000, payable immediately. The $19,000 will be used to develop the Ivanhoe claim, near the Badger Boy.

The Pharmacist Con. M. Co., have leased their property to Boston men for two years; royalty, 25%.

The report of Stratton's Independence for May shows that the production for the month amounted to 3635 tons ore, average value $73 to the ton in gold. The best record made any one day was the 23d, when 150 tons of ore averaging $120 to the ton was shipped, making the gross output for the day $18,000. The largest tonnage was on the 27th, when 200 tons of $75 ore was shipped from the property.

The shipments made from the property for the first ten days, and the average value of the ore, are as follows: May 1, 110 tons, average value $70; May 2, 110 tons, $65; May 3, 90 tons, $75; May 4, 100 tons, $60; May 5, 95 tons, $70; May 6, 110 tons, $65; May 7, 90 tons, $70; May 8, 90 tons, $70; May 9, 115 tons, $65; May 10, 115 tons, $80.

During the first week of June there was mined from the property 1115 tons of ore averaging four ounces gold to the ton.

The Lanterman Co. is shipping 100 tons a month, value $50, from stopes north of the 150-foot level.

IDAHO.

BLAINE COUNTY.

The mill at the Star mine, near Hailey, is daily making one and one-half tons of concentrates.

SHOSHONE COUNTY.

Wardner News: The Empire State M. Co. has let a contract for the longest flume ever built in northern Idaho, to be built on Pine creek and almost 16 miles in length.

MISSOURI.

There is decline in the price of zinc ore during the past year from $50 a ton to $25. The zinc mining industry has been built up with prices of ore ranging from $9 to $18 per ton; a fair profit can be made with high grade ore selling at $20. With ore selling from $45 to $50 per ton, enormous profits were possible.

From Joplin the American Zinc, Lead & Smelting Co. reports its output for the week ending June 10th to be 409,720 pounds zinc and 96,020 pounds lead.

MONTANA.

CASCADE COUNTY.

A second chute of copper glance ore has been found in the east drift of the Northern Pacific mine at Copperopolis.

FLATHEAD COUNTY.

Near Libby the Snowshoe mine is working eighty-five men. It will require 800 feet yet to carry the tunnel through the mountain. It is in about 2000 feet. Concentrates are shipped to the Great Falls smelter.

NEVADA.

HUMBOLDT COUNTY.

The Glasgow & Western Co. has discharged all but four of the miners employed at its Adelaide property, south of Golconda.

LINCOLN COUNTY.

In the April Fool mine at De Lamar six tunnels have been run in on the vein; the lowest one, No. 6, is in over 3000 feet. From this tunnel a shaft has been sunk and two levels cut upon it, drifting both ways on the vein, the ore averaging over an ounce of gold.

ORMSBY COUNTY.

The Nickel Syndicate cases are again in the United States Court. It seems that Attorney Deal sold the property under a judgment after advertising it but twenty days, under the State law, while the United States statutes require a longer publication.

WASHOE COUNTY.

Lone Pine district, 30 miles east of Fort Bidwell, reports a quicksilver find. L. S. Greedlaw says: "Several assays have been made showing 866 pounds of pure quicksilver to the ton." From another piece of rock was extracted "five globules as big as No. 12 shot, by means of retorting a tablespoonful of the rock."

WHITE PINE COUNTY.

The Chainman, at Ely, reports 4 feet of ore averaging $26.40 gold per ton.

The Nevada Copper M. & M. Co. has incorporated at Salt Lake, Utah, at $25,000; H. Barnett, secretary. The company owns the Copper King mining claims Nos. 1 and 2, in the Duck Creek mining district.

OREGON.

BAKER COUNTY.

A. Geiser has bought a half interest in the Brazos mine from E. and R. Blewett. It is locally reported that he will put a stamp mill and hoisting machinery on the property at once.

Surrounding Sumpter, within a radius of 20 miles, are 2000 quartz locations, 25 of which are producers and 200 others which have $3000 worth of development work done upon them. Within the same radius are 100 placer mines that are worked annually. Besides these, copper has been located.

JACKSON COUNTY.

J. J. Martin will reopen the Seattle Co-operative Co.'s mine in Applegate district.

J. S. Howard, of the High Line Ditch Co., Gold Hill, says work begins in September. The ditch is to tap Rogue river at the upper rapids, and will be 94 miles long, terminating at Gold Hill. There will be 11,000 feet of flume, 11 feet wide and 6 feet deep, using 1,500,000 feet of lumber in its construction. Where excavated, the canal will be 14 feet wide at top, 8 feet at bottom, and 6 feet deep. A right of way 50 feet wide has been obtained through the railroad and desert lands along its route. The grade is 1 inch in 1000, or 5.28 feet per mile, and the velocity of the current will be 3.96 feet per second, or 2.7 miles per hour. The capacity will be 15,681 cubic feet per minute, equals 10,455 miners' inches. Two siphons are figured in the estimates—one at Trail Creek canyon, 2870 feet long, 400 feet depression, with 40 feet head, consisting of three parallel lines of 34-inch diameter steel pipe. At Elk creek a similar siphon, 4740 feet long, will cross the canyon. These pipes will save the construction of over 20 miles of canal in a rugged country. The company hopes to put the work through within one year after the excavators have been put to work. Several hundred men will be given employment during its construction, which will be begun at the upper end, in order to float the lumber needed for flumes and culverts down from sawmills to be erected above. The ditch will supply water for a number of placer mines in that vicinity.

UTAH.

SALT LAKE COUNTY.

The new mill at the Fortune mine at Bingham is in operation.

The present daily capacity of the Highland Boy plant, 240 tons, is to be increased to 500 tons.

The Bingham C. & G. M. Co. is excavating the preliminaries for its new plant at Bingham Junction.

The new $1,000,000 smelter of the American Smelting & Refining Co. will be built at Sandy. A. Raht has charge of construction. The ground upon which the old Mingo plant now stands is to be utilized. The plant will be completed within a year. Until then the Germania works at Murray will continue in operation, after which they will be closed down and converted to the scrap pile. The Hanauer plant will not be resurrected, but all the smelting operations conducted at Salt Lake City by the trust will be centered at Sandy.

SUMMIT COUNTY.

The lease on the Apex mine at Park City has expired; the management will operate the mine themselves and have re-engaged their former superintendent.

The jury in the $2,000,000 damage suit of the Crown Point M. Co. against the Ontario returned a verdict of $32,092. Both sides consider it a victory, it deciding that the apex passed out of the side line. Each side is granted sixty days to file a bill of exceptions.

WASHINGTON.

United States Assayer Wing, reporting on the mineral resources and production of the State, says: Metal yield for 1899 aggregates a total of over one million dollars, as is shown by the following tabulated statement:

Metals.	Quantity.	Value.
Gold, fine ozs...	35,284.19	$ 729,387 82
Silver, fine ozs., coinage value.	289,660.67	374,510 76
Copper, fine lbs., @ $17.61 ℔ cwt	76,410.00	13,455 80
Lead, fine lbs., @ $4.47 ℔ cwt...	1,032,069.00	46,133 48
Total value.....		$1,163,487 86

FERRY COUNTY.

At Keller a 350-foot tunnel will be driven on the Legal Tender; the ore gives gold and silver values of $12.50.

OKANOGAN COUNTY.

W. H. Thompson of the Gold Standard group, in the Slate Creek country, is arranging for a stamp mill and crusher, to cost from $15,000 to $18,000.

Palmer Mountain Prospect: At the Golden Zone, Loomis, 1000 tons of ore has been milled with a cleanup result for a thirty days' run of about $10,000, one-third of which is taken up by amalgamation and two-thirds in concentrates. A saving of 85% of assay values is made. The mill will be increased to fifty tons capacity.

SKAGIT COUNTY.

Anacortes reports that the Eureka group, Slate Creek camp, is sold to C. D. Lane of California. This property several years ago was under bond to Montana men, who allowed their bond to lapse after spending $50,000 on the property. The original bond was for $88,000, and the cash selling price is said to be nearly that sum. C. W. Tozier, under whose supervision the Eureka has been developed, will finish the tramway between the mine and the stamp mill. The mill has ten stamps, 1100 pounds each. It is the intention to put in a roasting furnace.

FOREIGN.

BRITISH COLUMBIA.

At Rossland, miners sinking the new five-compartment shaft of the Le Roi mine, have made connection with the up-

raise from the Black Bear tunnel. The shaft is timbered and enlarged to the full standard size. Sinking to the 900-foot level has begun.

S. H. McCoy of Rossland has submitted to the Mabel management at Lima, Ohio, plans for the development of the property, aggregating $30,000, and is told to go ahead.

From Greenwood Supt. Johns reports a strike at the 200-foot level of the Sunset in Deadwood camp, 320 feet from the shaft. The mine is owned by the Montreal-Boundary Creek Co.

The spur from the main line to the Granby smelter is completed; the Knob Hill and Old Ironsides mines at Phœnix are now able to ship continuously, these two mines having over 8000 tons in the ore bins waiting for cars to carry it away.

At Rossland the Iron Mask mine has shut down pending the determination of questions involved in the litigation with the Center Star as to the apex and continuity of one of the veins.

The Miner says a little platinum was produced last year at Quesnelle and other places. From the Similkameen comes the record of fifty-five ounces. Many of the placer miners do not seem to know its worth and throw it away as so much black sand. W. F. Robertson states that the crude platinum sand, as washed out, is worth from $12 to $15 per Troy ounce.

The following is furnished by S. S. Fowler of the Ymir mine at Ymir regarding the first year's run of the 40-stamp mill. The duty of the mill has been as follows:

Running time of 40 stamps.	Tons crushed.
March, 2 days 13 hours	250
April, 16 days 6 hours	1,700
May, 17 days 4 hours	1,450
June, 21 days 14 hours	2,107
Sept., 14 days 18 hours	1,550
Oct., 27 days	2,790
Nov., 29 days 5 hours	2,943
Dec., 23 days	2,348
Totals. 172 days 12 hours	17,137

Average crushing, 99⅓ tons per 24 hours.

Tons, 17,522; cost per ton, $0.8237.

MEXICO.

J. W. Thompson, Supt. Sahuayacan mines, Jesus Maria district, 130 miles west of Guerrero, State of Chihuahua, is instructed by the stockholders to buy $30,000 mining and electrical machinery.

At El Oro the management of the American M. Co. has been assumed by A. F. Bird from London.

SIBERIA.

The following note has been received at Washington, D. C., from the Russian embassy:

"WASHINGTON, May 14, 1900.

"MR. SECRETARY OF STATE:—The question of gold mining on the Russian Pacific coast has called forth numerous inquiries addressed both to the imperial embassy and to the Russian consulates in this country by citizens of the United States who are desirous of participating in the exploitation of the mineral wealth in Russian territory. Erroneous views have arisen in this connection which it is my duty, in the interest of our two Governments and for the prevention of any misunderstanding, to rectify.

"The Imperial Government granted, under date of the 11th ult., the exclusive right to exploit the mineral wealth in the Peninsula of Tchoukotsk to Col. Vonliarliarsky of the Russian Guards. This gentleman has organized an expedition, under the direction of Mr. Bogdanovitch, a mining engineer, which sailed from Russia on May 1st for the Peninsula of Tchoukotsk via the United States.

"According to information which I have received from various quarters, numerous gold seekers propose to come from Alaska in the course of the year to the Russian territory to which the aforesaid Russian expedition is bound, which expedition, as I have already had the honor to inform Your Excellency, is alone authorized to carry on mining operations in the country.

"In apprising you, Mr. Secretary of State, of the measure adopted by the Imperial Government, whereby the exclusive right to exploit the gold-bearing lands and others is conferred upon Col. Vonliarliarsky, I have the honor to beg you to bring this measure to the notice of the United States authorities that are interested, with a view to the avoidance of regrettable misunderstandings.

CT. CASSINI."

Mining of all kinds in Siberia has hitherto been beset with so many difficulties as to discourage operators, native or foreign. The concession to an American—D. M. Clarkson—to mine for gold or coal on his own account, without the usual adjunct of a Russian partner, seems to point to a more liberal policy. Still, there are restrictions. Mr. Clarkson and Mr. Emery—the latter the pioneer American merchant of Siberia, who has also been granted special privilege by imperial rescript—can not enter into combination with any existing company nor operate any but new claims, and even then work must be done under disadvantages which would be hardly tolerable to ordinary American prospectors. For example, one must have special permits from local authorities for felling trees and constructing roads, and there are certain rules to be followed when minerals other than those specified in the grant, as copper, iron, etc., are found.

The mineral wealth of this region has been for years practically untouched. Chinese have worked the auriferous sand on a small scale, and even now they are thrashing over the old material with minimum success. The complaint has been that there was no capital to develop the mineral deposits; yet, within four years, Belgian, English, French and American experts have visited Siberia, examined the various districts and advised the formation of companies for the exploitation of mines, but prudent foreign companies withheld the capital, mainly because of the governmental restrictions.

The quartz gold mines on Askold island, near Vladivostock, are owned by a Russian firm and have been worked for two years with gratifying results. In 1897 the gold was first discovered; in 1898–1899 prospecting was begun; in the spring and summer of 1899, 500 tons were extracted with poor machinery, the estimated value being $25,000. Some thirty odd tunnels have been prepared, and the managers hope to obtain this year 3000 tons of quartz, worth perhaps $150,000, and about 9000 tons of quartzite. They anticipate from the prospecting of 1900 some $50,000 to $75,000 clear profit. The gentlemen in charge of this mine are old residents, naturalized subjects and cautious business men.

Either the announcement of the concessions to Messrs. Emery and Clarkson or the stories emanating from travelers in Siberia have caused many inquiries to be sent to this agency as to the chances for mining in this locality. These inquiries come from Cape Nome, the Klondike and the Pacific coast generally, and in most cases could be answered only at St. Petersburg. It is true the Imperial Government invites all foreign capital to enter its territory for mining or manufacturing purposes; but restrictions are severe. With regard to gold-mining privileges, the applicant must make petition in person here, or he may go to St. Petersburg if more convenient. In the latter case the imperial authorities would refer the matter to the Governor-General here before deciding the case. In no instance would such a permit be hastily granted, and an applicant without references as to character and ability to carry out his plans would undoubtedly be rejected. To land on the soil of the Maritime Province and proceed on one's own account might subject the prospector to murder or robbery on the part of wandering convicts or hostile natives. The Government also exercises strict espionage in matters of passports, permits, etc., and there is a high tax on melting and conveyance from the mine to the government office. The following paragraph has appeared in American newspapers:

"From Port Arthur this summer several Americans have gone into Manchuria to prospect for gold; and, as the Russian Government advances money to bona fide miners and buys the entire output of the gold mines, there is some degree of stability in the venture."

Nothing could be more misleading than such statements. The Russian Government does not yet profess to own Manchuria. It advances no money to miners or manufacturers of any kind, except to those coming within the scope of its administrative policy. It does assist immigrants after they have arrived, but does not pay their way. It buys the output of all mines, on broad grounds of governmental policy, as it controls mining business of whatever character. But this fact would afford little "stability" to the venture of any American who came to Manchuria or the Maritime Province to engage in mining without a special permit, or a Russian partner, or a good supply of capital and abundant machinery.

In this connection it should be honestly said, without any disparagement to the future of Siberia, that it is no special place for Americans. Those who came here twenty-five to thirty years ago did well, but all had either Russian partners or married Russians and identified themselves with the country. Of those who have come within a decade, only one is an independent business man, and his success came from a Russian partnership. The others are in subordinate positions, earning salaries about on a par with what they would earn in the United States. Siberia is no more "a field for Americans" than it is for Germans, Danes or Swedes—indeed, not so much. Most of the young foreigners have a speaking knowledge of one or more languages besides their own. The best chance for Americans here is in the line of mechanical work. A well-equipped machine shop, with competent American artisans and specialists in certain industries, would do well in Siberia; but no American without capital or special skill in his own trade has any business here.

R. T. GREENER.

Vladivostock.

Throughout all Siberia, private individuals may engage in working auriferous gravels on all lands, irrespective of their ownership, whether belonging to the domain of the Empire or even to the Cabinet of His Imperial Majesty. The mining districts of the Altais and of Nertchinsk are exceptions to the rule.

The required special privileges are unique, and not likely to be obtained easily. Their greatest value, indeed, is the removal of certain restrictions which have hitherto prevented a foreigner from enjoying equal privileges with Russians in these two provinces.

Private persons may prospect and work gold reefs in all places where placer diggings are permitted, except in the districts of the Altais and of Nertchinsk, which are the private property of His Imperial Majesty. If veins are discovered in the "pochva" (bedrock) of placers already being worked, owners are permitted to mine them within the legal boundaries of their concessions.

Persons of any condition or nationality (Russian or foreign) who are in the enjoyment of full civil rights may work auriferous deposits. The exceptions are: (1) Hebrews, where local law forbids their residence; (2) mining, legal and police officials; (3) officials of the central general administrative regions; (4) wives and children of such functionaries. In addition, in the Maritime Province and the Amur and adjacent islands on our coast, the right to mine gold or any mineral is reserved to Russian subjects, except in the special grants referred to. Hence, individuals debarred from carrying on gold-mining operations on their own behalf can not act as attorneys or agents for other persons in such matters.

To acquire the right to prospect for either alluvial or quartz gold, all persons or companies must procure a special permit on stamped paper issued by the Department of Mines. Permits contain no time limitations and are not transferable. A declaration in writing must be made to the police department of the locality where operations are proposed. The locality must be designated, as well as names of men belonging to the prospecting party, the date the expedition is to set out and the place of departure. The passport and papers of each person must be accurately set forth. The cost of advertising the permit in the local press must be paid. In free territory prospectors are entitled, so far as placer mining is concerned, to occupy an area of 5 versts (3.3 miles) in length and in breadth the width of the valley in which operations are conducted; in quartz mining, to an area within a radius of 1 verst (0.663 mile) from a post bearing the date when prospecting began and the name of the individual or company. After the post is set up, the right to prospect continues as long as the party stays on the tract so marked out. Should the ground be found sufficiently rich to be worthy of "a request for a location," at least two shafts must be sunk, demonstrating the presence of gold, and "location posts" in place of the "prospecting posts" must be set up.

The district engineer takes note of the copies of the declaration sent to him. He passes upon those meeting the requirements of the law and grants locations according to the requests of the claimants. These allotments of land (otvodi) take place in the spring, summer and autumn, and must be made by a special commissioner of locations (otvodchik) within a period of two years from the date of the district engineer's grant. In eastern as well as in western Siberia the total length of a placer allotment must not exceed 5 versts (3.3 miles) in length, calculated from the "indicator's posts;" in breadth, it may comprise the whole valley to the extent of 250 sagens (1750 feet).

In addition to the land dues and tax per pood (36.112 pounds) there is charged for the transportation of the gold to St. Petersburg: From Irkutsk, 46 rubles ($23.69) per pood; from Tomsk, 33 rubles ($16.99). The conveyance of the gold, in sealed sacks from the mines to the district office of the mining police and thence to the Department of Mines, is at the expense of the mine owner. The charge is 150 rubles ($77.25) per pood.

The operator must bear the cost of melting down the gold. The fee, by the new regulation of February 3, 1897, is uniform—42.315 rubles ($21.79) per pood of pure gold.

Such a tax per pood, at best when it exceeds a certain rate (say, 3% to 5%), is without doubt detrimental to the development of the gold mining industry, at least by outsiders, for it obliges the operator to confine himself to deposits sufficiently rich to enable him to pay this duty before meeting his own expenses.

THE KLONDIKE.

The output of the Klondike district—the washings from the dumps of 560 claims that were worked on all creeks last winter—will, it is reported, amount to $18,553,-

270. This amount of gold was washed from 155,080,180 pans of Klondike gravel. In all 5280 men were employed during the season. This in brief is the story as tabulated at Dawson City May 25. Following is a statement of the season's production in detail:

Claims worked.	Creek.	Men employed.	Total production.
49	El Dorado	541	$3,746,200
13	Gay Gulch	62	106,800
6	French Hill	15	24,900
3	French Gulch	22	48,000
2	Oro Grande Gu'h	15	21,000
8	El Dorado Hillsides	32	32,700
29	Bonanza, above Discovery	315	1,231,900
47	Bonanza, below Discovery	642	1,984,590
34	Gold Hill	235	1,002,000
8	Bonanza Hill	26	52,600
16	Chehecaco Hill	176	712,300
13	Adams Creek	37	92,200
8	Adams Hill	61	195,400
11	Magnet Gulch	96	477,000
16	American Gulch	81	225,000
17	Fox Gulch & Oro Fino	121	702,000
6	Monte Cristo	58	173,500
12	King Solomon's Hill	148	749,100

31	Gold Run	446	1,037,950
18	Hunker, above	142	423,100
35	Hunker, below	311	788,000
5	Hunker, benches	59	180,000
8	Gold Bottom	23	39,200
	Quartz Creek	100	200,000
	All other creeks	250	500,000
560		5,280	$19,553,270

The steamer Cutch, from Skaguay, reports excitement over the White Horse copper properties, where machinery is arriving by every train. The last spike was driven on the White Pass Railway between Caribou and White Horse June 17th.

Personal.

M. E. PURCELL is the new Supt. Giant M. Co., Rossland, B. C.

J. A. WARDELL left San Francisco this week for Tientsin, China.

B. MACREADY is now Supt. Quartette M. Co., Searchlight, Nevada.

SEYMOUR WATERHOUSE has returned to San Francisco from Europe.

WILLIAM HART, Supt. John A. Logan mine, Victor, Colo., has resigned.

E. H. BEEBE has been appointed Supt. Con. G. M. Co., Cripple Creek, Colo.

CHAS. BUTTERS is expected to arrive in Salt Lake City, Utah, next week.

NICHOLAS TREGEAR is the new Supt. Winnipeg M. & S. Co., Greenwood, B. C.

A. D. CULLUM of London, owner Castle Peak mine, Mono Co., Cal., is visiting the property.

L. L. MYERS has returned to the North Bloomfield, Nevada Co., Cal., from San Francisco.

W. S. KEYES has returned to San Francisco from giving expert testimony at Park City, Utah.

W. W. KIRKHAM, Supt. La Suerte mine, Grass Valley, Cal., has returned from San Francisco.

A. VAN PATTEN has resigned the superintendency of the Carbonate Hill mine, Morgan county, Utah.

R. J. WALTER, E. M., of Denver, Colo., is at Jackson, Amador county, Cal., in the interest of a mining company.

A. D. HENDERSON is succeeded in the superintendency of the El Dorado, Cal., W. & D. G. M. Co. by J. L. Rowley.

W. C. RALSTON, President California State Miners' Association, has returned to San Francisco from an extended sojourn in the East.

MASTER MECHANIC CULVER of the Ajax, Colo., G. M. Co. is succeeded by H. D. Colburn and has charge of new work on the Goldfield, Colo., water works.

THE Montana School of Mines has chosen A. N. Winchell to fill the chair of geology and mineralogy and C. H. Bowman teacher of mechanics and mining engineering.

T. C. ARCHER, late Supt. Mountain Copper Co.'s mines, Shasta county, Cal., sails on June 25th for southeast Alaska, to examine the copper deposits of that district.

R. C. FREY, late assayer at the Yellow Aster mine, Randsburg, Cal., has a telegram from the manager of the Simmer & Jack mine, Johannesburg, South Africa, summoning him back at once. He had been getting a salary of $500 per month, and when he left there was placed under half pay till called back, from which date he is to have full pay.

CONGRESSMAN BARHAM has returned to California from Washington. He secured a unanimous report from the Committee on Mines and Mining on his bill for a Department of Mines and Mining, creating a new cabinet officer. He regrets, however, that the Senate felt that a Commissioner of Mines and Mining would meet the situation. The action of the Senate may operate to defeat his bill for a cabinet officer, but Mr. Barham feels certain that when the bill for a Department of Commerce and Industries is reported from the Committee on Interstate and Foreign Commerce, of which he is a member, it will provide for an Assistant Secretary of Mines and Mining.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING JUNE 12, 1900.

651,778.—CIGAR BUNCH ROLLER—F. L. Brown, Edmonds, Wash.

651,780.—MOTOR—H. S. Delamere, Ferndale, Cal.

651,457.—MITER BOX—R. H. Dorn, Los Angeles, Cal.

651,503.—RIVETING MACHINE—S. Foreman, Sacramento, Cal.

651,526.—RAIL FASTENER—J. W. Gay, Crowley, Or.

651,351.—BOOK BACKING — F. Hager, Portland, Or.

651,506.—AMALGAMATION—E. Heiligendorfer, Canelas, Mexico.

651,357.—CHECK HOLDER—J. S. Howk, Reno, Nev.

651,629.—NAIL DRAWER—Jordan & Halstead, Visalia, Cal.

651,666.—WATER CLOSET—J. B. Kelly, Portland, Or.

651,762.—WEEDER—L. J. Klinger, Dufur, Or.

651,507.—WEIGHT MEASURER—L. Lacaille, Golden Gate, Cal.

651,512.—MATCHER HEAD—W. W. Phillbrick, Seattle, Wash.

651,725.—ELEVATOR—S. C. & W. N. Ruble, Golden, Or.

651,514.—GUN SIGHT—W. F. Sheard, Tacoma, Wash.

651,395.—CURETTE—M. R. Stapp, Aberdeen, Wash.

651,539.—DESK ARM REST—F. W. Warren, S. F.

651,454.—TIDE MOTOR—M. C. Wilkinson, Los Angeles, Cal.

32,810.—DESIGN — Kate L. Nevins, Rancho Hermosa, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DESK ARM REST.—No. 651,539. June 12, 1900. F. W. Warren, San Francisco Cal. The object of this invention is to provide an arm rest and adjustably attach the same to desks, such as are used by bookkeepers and writers. It comprises a supporting bracket with a slide upon which the lower end of the bracket is pivotally connected so that the bracket may be adjustable in vertical planes. Connected with this is a means for holding the bracket in its adjusted position, and a guide fixed with relation to the desk and essentially parallel therewith upon which the slide is movable so that the rest can be used at any desired point with relation to the desk surface. The arm rest can be disengaged and the whole device turned downwardly and out of the way at will. Ball or other anti-frictional bearings are introduced between the slide and the fixed guide upon which it moves.

BARREL AMALGAMATION OF PRECIOUS METALS. No. 651,506. June 12, 1900. Ernst Heiligendorfer, Canelas, Mexico. This invention relates to an improvement in the amalgamation of precious metal-bearing ores by what is known as the "barrel process." It consists essentially in the employment of copper amalgam in conjunction with what are known as rebellious ores. The operation is carried on in vessels of such material as will not decompose copper sulphate, and prevents the destruction and loss of the quicksilver which would be effected by raw ores containing an excess of sulphur. The use of the copper amalgam in the barrel enables me to not only desilverize free milling ores more perfectly, but to extend the capacity of the apparatus over a wide range of raw ores hitherto incapable of being profitably treated in this class of apparatus.

Book Notices.

"Topographic Surveying," including geographic, exploratory and military mapping, with hints on camping, emergency surgery and photography; by H. M. Wilson; 900 pages, 8vo; John Wiley & Sons, New York, adapted to the needs of the topographer in the field or the student. Plane surveying, map construction, topographic and geodetic surveying are treated; the work is profusely illustrated and so systematized as to make its contents readily adapted. The book is of value to any one contemplating field work. Price $3.50, postpaid.

Recently Declared Mining Dividends.

Napa Quicksilver M. Co., California, 10 cents per share, $12,000	July 2
New Idria Quicksilver M. Co., California, 10 cents per share and 10 cents extra, $20,000	July 2
Horn Silver M. Co., Utah, $20,000	June 30
Isabella G. M. Co., Colorado, 3 cents per share, $67,000	June 21

SITUATIONS WANTED.

Cyanide Man and Assayer
is open for engagement. Experienced and up to date. Address CLIMAX, care of Mining and Scientific Press.

WANTED—SITUATION AS MANAGER OF producing or developing property. Twelve years' experience in gold mining and milling, copper mining and smelting. Address C. H., care of Mining and Scientific Press.

MINE SUPERINTENDENT, TEN YEARS' experience in Michigan, Montana and Idaho, desires engagement as Supt. or manager of developing or producing property in this country or abroad. Best of reference. Address D. C., care this office.

POSITION WANTED TO MANAGE A MINE and mill. Years of experience. Thoroughly practical, pushing and energetic. Handle men with skill and economy. First class testimonials as to integrity, etc. Address SKILL, this office.

Quicksilver
For Sale in Lots to Suit.
REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

INTERESTING TO MINERS!
FOR SALE.

Twelve Silvered Copper Plates, each 4 feet square, slightly used, ready for use, f. o. b. San Francisco.

1600 feet Steel Pipe, double riveted, 22 to 26-inch diameter, 10 to 12 gauge. Will stand pressure up to 300-foot head.

Also, one 3¾-inch Schuttler wagon and one road plow.

(Delivered at Libby, Montana.)

Second hand sawmill, complete with boiler and engine Kalispel, Montana.

A bargain can be had on any part or all of the above. Address S. T. F., Mining and Scientific Press office, 330 Market St., San Francisco, Cal.

A VAST COPPER PROSPECT
FOR SALE.

A mountain of ore, with abundance of timber and water for all purposes

Only men with large capital need apply.

Address T. McGILL, Chat, Lassen Co., Cal.

CYCLONE
Gold Separator and Amalgamator.
Closest gold saver. Lightest weight, most compact, and only device which can be worked on land or under water. Call and see test made. WM. H. BIRCH & CO., 135 First St., San Francisco, Cal.

WHITEWASHING —AND— TREE SPRAYING **PUMPS.**
Prices from $4 to $60. Nozzles from 75 cts. to $1.00. Catalogues. WM. WAINWRIGHT, 1411 Jackson St., San Francisco. Telephone Hyde 2986.

WANTED.
A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.

Address: **EDWARD N. BREITUNG,**
MARQUETTE, MICH.

Quicksilver
—FOR SALE BY—
The Eureka Company,

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

A Money Maker in Nicaragua.

MURRA GOLD MINING COMPANY, NICARAGUA, C. A.
NICARAGUA, June 20, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

After an experience covering a period of three years with both the first and improved "Tremain Steam Stamp Mill," in every particular I have found it perfection—a money maker, and just the thing for a small capital, while companies organized on a large scale would do well to look into its merits.

I find no difficulty in crushing eight tons of ore per day and running on hard ore This mill should be a winner.

Very truly yours,

[SIGNED] L. W. ADAMS,
General Manager Murra Gold Mining Co.

Eight Years in Operation Without a Cent for Repairs.

GOLDEN P. O., JOSEPHINE CO., COLO., December 23, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

Our Tremain Mill is giving us good results, and although being in operation since 1892 has not cost us $1 for repairs, and to-day is making 180 drops per minute with 95 lbs. steam pressure.

The ore we are working at present is soft and we mill in 24 hours, using No. 10 slot screen, 15 tons.

Yours truly,

M. C. DAVIS,
Superintendent Sarah Belle Mines.

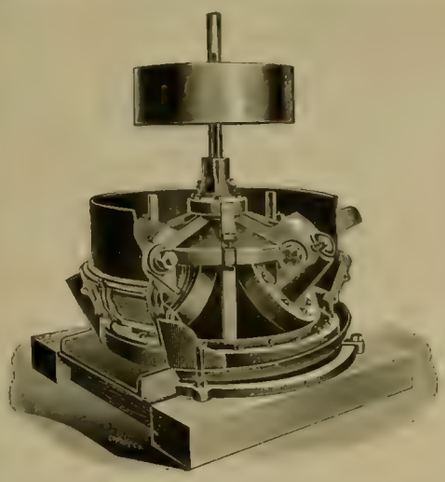
Running Under Compressed Air in West Australia.

293 ST. GEORGE'S TERRACE, PERTH, W. A., February 6, 1900.

F. R. PERROT, ESQ., AGENT OF GATES IRON WORKS, PERTH, WEST AUSTRALIA.

DEAR SIR: In reply to your enquiry as to the working of the Tremain Mill on the Burbanks Grand Junction, I would state that at the start we worked this from the boiler supplied by the Gates Iron Works Company, but owing to certain irregularities of the running, which were in a measure due to the intermittent supply of ore and the short time that we were able to run it per day, I finally laid on air piping from my air compressor, a quarter of a mile distant, and used the boiler as an air receiver, with the result that I got an absolutely constant run, which, I believe, averaged about 105 drops per minute, and this was kept up with great regularity and showed a much better return in the treatment of the ore. The usual air pressure in this case was 80 lbs., whereas under steam we were not so satisfied with the result as worked at 100 lbs. By this we were also saved in cost the charges of stoker, fuel and water, and it was worked with much greater cleanliness, and during the whole time the mill was running—which was several months—it never froze up on us or showed any signs of trouble in that direction.

The mill is now temporarily stopped, but when it is again started I shall most decidedly continue the use of compressed air.



Yours faithfully,

[SIGNED] GEO. HEWER.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Report of the California Debris Commission.

An important State and Federal engineering work has been for some years projected, growing out of the necessity of retention of debris in certain California rivers, and the matter has been the subject of considerable attention since 1892. At that time the California State Miners' Association was organized, and through its efforts a State appropriation of $250,000, supplemented by a Federal appropriation of a like sum, was secured in 1896.

Since then the Government engineers in charge of the work have been endeavoring to present a practical and effectual plan that would secure the desired result. There has been unavoidable delay since the inception of the scheme over eight years ago, but many difficulties have been successfully overcome, and the project approaches some definite result. Little has been said in these columns for the past three years concerning the matter, because there was nothing further to do than await the result of the labors of the California Debris Commission. The most recent result is embodied in a report which is this week received from Washington. It is entitled, "Project for Impounding Mining Debris in the Yuba River, California, With a View to the Improvement of Navigation in the Sacramento and Feather Rivers." It is almost entirely the work of Hubert Vischer, assistant engineer to the Commission. Col. Mansfield, Lieut. Col. W. H. Heuer and Capt. Deakyne, U. S. Corps of Engineers, in transmitting the report endorse it. They say: "The Commission believes the project practicable and worthy of adoption, and so recommends. It is the only one thus far evolved which gives reasonable hope of success, and at a very moderate cost for storage. Mr. Vischer's labor, thought and skill in working up a project of such unusual character and scope merits our highest appreciation, and is worthy of every commendation."

This report the Commission makes to Gen. Jno. M. Wilson, chief of engineers, U. S. Army.

In transmitting the report to the Secretary of War, Gen. Wilson says: "The views and recommendations of the Commission are the result of careful study and investigation for a period of over five years, and I recommend the approval of the project submitted."

The last eight words are the most important ever uttered by an official in that position regarding the whole matter, which has been such a vexatious problem to the California hydraulic miners and valley residents affected. Those eight words have a magical potency in putting forward the proposed work. Upon the receipt of that recommendation from the highest and last authority, the Secretary of War transmitted the report to the Speaker of the House of Representatives. Congress at the recent session acted affirmatively, and the plan thus endorsed and accepted now has opportunity of being tried, the money at last being available.

The above is a plain statement of the facts to date concerning a subject of which so much has been written.

We will now give a few salient points from the report, which is a bulky one. For proper understanding of the subject, an engraving is here reproduced of barrier No. 1 from the accepted plan of the work.

The Commission selected the Yuba river as the site of the proposed barrier, as that stream carries more detritus than all the other tributaries of the Sacramento river combined. The project has for its primary object the storage of mining debris within the bed of the Yuba river by a system of works designed to separate the coarse material from the fine, and for a secondary object the controlling of the low-water channel within narrow and well-defined limits, in order to preserve in place the extensive deposits in the river below, the general scheme being to erect several barriers across the bed of the river, and to form a settling basin three miles long and half a mile wide on the south side of the river, this settling basin to consist of a levee protected against wash, to be built in the bed of the river, with its upper and lower ends connecting with the existing levee and shore on the south bank; these end walls to have inlet and outlet weirs and conduits to regulate the inflow and outflow of river water, and to cause the finer material carried in suspension to be deposited and held in the settling basin, through which, at all except extreme flood stages, the river will be compelled to flow; and below this basin to confine the river channel within well-defined lines by necessary training works:

The upper barrier will have a height of about 40 feet above the present bed, and will extend entirely across the river. Its crest length will be 1000 feet. This barrier is to consist of gravel, cobbles, brush, rock paving, and some masonry in its lower slope; a masonry crest, and a double row of sheet piling in its toe. It is to be built up gradually, the river flowing over it, and its chief function will be to impound coarse material behind it and form a new grade for the tailings, extending up to and beyond the Narrows.

Barrier No. 1 (see engraving) is to be located about ½ mile below barrier No. 2. Its general construction is very similar to that proposed for No. 2. Its height will be 18 to 26 feet above the tailings now in the river, and the crest length proposed is 1100 feet. At its northerly end will be a by-pass, with a weir 600 feet in length, which will in extreme flood stages (assumed at 125,000 cubic feet per second) permit a flow over the lip of the weir 7 feet in depth, with a flow over the dam estimated at 3½ feet.

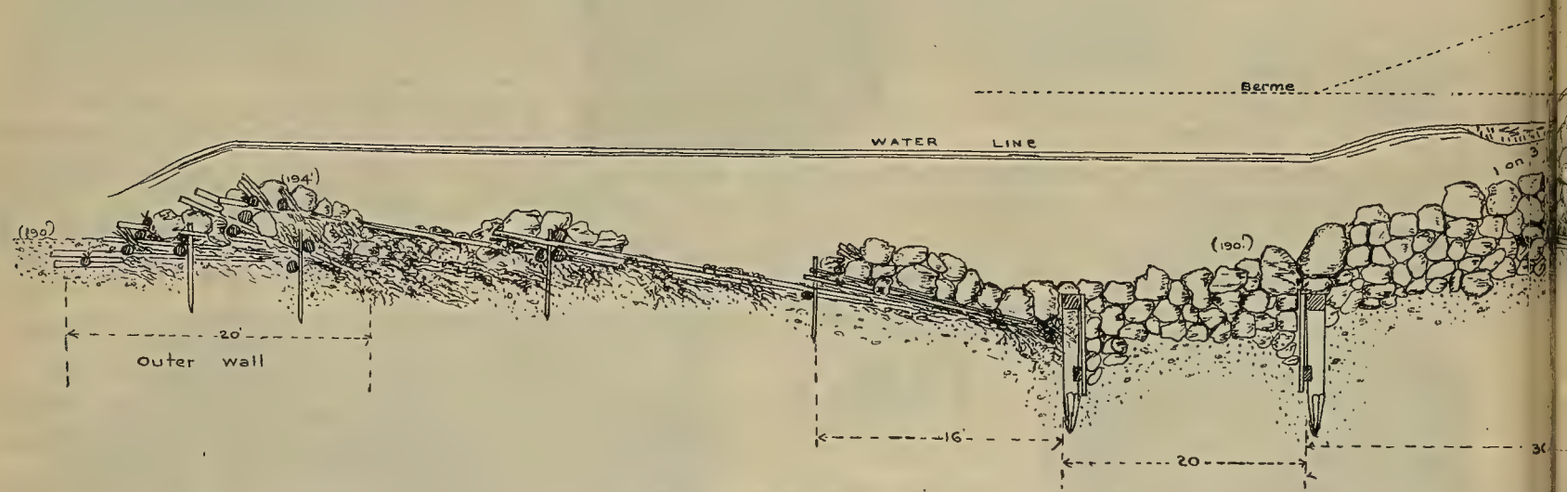
Barrier No. 1 makes a water cushion for barrier No. 2. At all but flood stages of the river the flow will be through the by-pass or weir.

Both barriers together may raise the plane of river deposits about 40 feet, and are estimated to store, on an assumed gradient of 15 feet per mile, a volume representing 36,000,000 cubic yards of coarse material, at a cost of about $\frac{7}{10}$ cent per cubic yard.

The next structure, a flood overflow barrier, is to be located about ½ half mile below Dry creek. It is to be a composite structure, consisting of some crib work, with rock filling and paving, and some sheet piling. It is a low structure, 4000 feet in length. During floods it will be submerged; at other stages of the river it will direct all the water into or through the settling basin.

The next barrier is to abut against Daguerre Point, extending south to the levee or embankment of the settling basin. Its crest length will be 3000 feet and its general height 14 feet.

A cut is made through Daguerre Point to rectify the flow and to share with the northerly half of the barrier the duty of passing the flood waters. This barrier is to be essentially a brush and gravel structure, heavily protected with rock.



The flood overflow barrier directs the ordinary flow of the river into the settling basin through inlets in the embankment forming the upper end of the basin.

The basin, as designed, is capable of holding about 14,000,000 cubic yards of fine sediment, and by extending it farther to the westward it can be enlarged to a capacity of at least 50,000,000 cubic yards additional. The project, as here outlined, is estimated to cost about $780,000, exclusive of the land required (about $20,000 more).

The project as submitted is novel, since nothing of the kind, so far as known, has ever been attempted, and it is to a certain extent experimental. The various structures are simple, and are believed to be safe, practicable, and reasonably permanent. They can be repaired if required, and if abandoned, not maintained, or never completed, can not leave the river in any worse shape than at present. If constructed, it is believed that they are capable of storing the debris now in the Yuba river and its tributaries, which is far in excess of that in all the other tributaries of the Sacramento river. The result of the storage can not be otherwise than beneficial to the navigation and commercial interests of the Sacramento and Feather rivers. The Commission says: "Especial attention is invited to the fact that the object sought to be accomplished is the storage of the detritus now in the Yuba and its tributaries, with a view to the improvement of the rivers below, and decidedly not with the view of permitting unlicensed or indiscriminate hydraulic mining at localities above the impounding works.

"When the works have been completed and in operation for several years there will be time and opportunity to determine whether or not the system is capable of sufficient expansion to warrant an attempt at storing therein the tailings from the hydraulic mines without compelling each mine to impound any or all of its debris."

In the concluding part of his report Mr. Vischer says: "Only a general scheme of operations can be mapped out for such work in advance, a detailed estimate being, of course, out of the question. The work would resolve itself into a multitude of small works, some of them too trifling to require any plans, and would be of the character best covered by the daily labor of an intelligently directed work force, but not necessarily one kept always organized. The operations would consist in clearing lines of brush to facili-

SECTION, DRAWN TO SCALE, OF PROPOSED BARRIER NO.

tate flow, in blocking side channels gradually to obstruct it, in building brush work for spurs to direct current, or for silt arresters to build up land, the work wherever possible to be disposed at the training walls or near by, but not following any prescribed line. The lines of training wall, so called, would actually be property lines, inside of which liberty should exist to conduct work with perfect freedom. There might be some dredging or snagging to remove obstacles in the path of flow, but seeing that the drainage from the settling basin is intended to follow a southerly route, operations during the dry season of the year would not be interfered with by water. The outcome, perhaps attainable at the end of several years, would be a well-defined river channel of good capacity, bordered by lands which would overflow and form part of the river during flood, and back of these there would be private lands in process of reclamation, but perhaps still subject to periodical inundation. In brief, the idea is to cause the river to make deposits where desirable, but otherwise to prevent them. Such work is very desirable and should not be needlessly deferred, and it is therefore suggested that an item to cover the cost—for instance, $50,000—should be added to the estimate for improving Yuba river.

"We have an estimate of the amount of deposit from the Narrows to the State dam during nineteen years, 33,637,000 cubic yards; also an estimate of the fill from the State dam to Marysville for six years, 14,238,000 cubic yards, but no figures obtained by direct observation for the deposit upon the whole river area for any period at all. But it will hardly be questioned that the deposit over the upper portion of the river must have been relatively less during the last six years than it was for the earlier thirteen. The last six years have been relatively dry years, without notable freshets. Hydraulic mining has been under control since 1893, whereas the first thirteen years cover at least five years when hydraulic mining was at its highest activity. Finally, the sweeping of the upper canyons was pretty well accomplished prior to 1893, as there are reports from actual examination to prove. It would, therefore, appear that we are safely within the facts if we take the sum of the two averages and accept it as an expression of the annual rate of accumulation since 1893. The first average is 1,770,000 cubic yards, in round numbers; the second, 2,373,000, and the sum of both, 4,143,000 cubic yards. This figure may be used as an indicator of the length of time that the storage provided under the project of 1899 would last if there should be no increase of the annual requirement, and under present conditions this requirement should be a decreasing quantity.

"Comparing the foregoing figures with the storage estimates for the higher levels of the Narrows dam, the showing is favorable to the project of 1899, considering only the totals and rates, quite independent of the security afforded by the two systems. The 1899 project possesses superiority also in that it provides for future requirements if need should arise, while the Narrows dam gave no such outlook. Should barriers 1 and 2 be built and meet expectations, additional barriers can be built as required, each being a practical repetition of barrier No. 2, which may serve as a type for all of them. The estimates for the 1899 project are sufficient to cover the storage requirements for several years—perhaps ten, perhaps more. Having indicated the practical identity of the methods proposed for storing coarse material, the estimates made in former years may be accepted as safe figures for the cost as well as for the amounts of additional storage, with the understanding that the figures refer to coarse detritus.

"With this system of storage by low barriers, which do not require bedrock foundations, the objectionable features of the Narrows canyon would disappear, and the gorge, considering its superior rock supply and favorably situated bluffs, would possess advantages which should not be lost sight of.

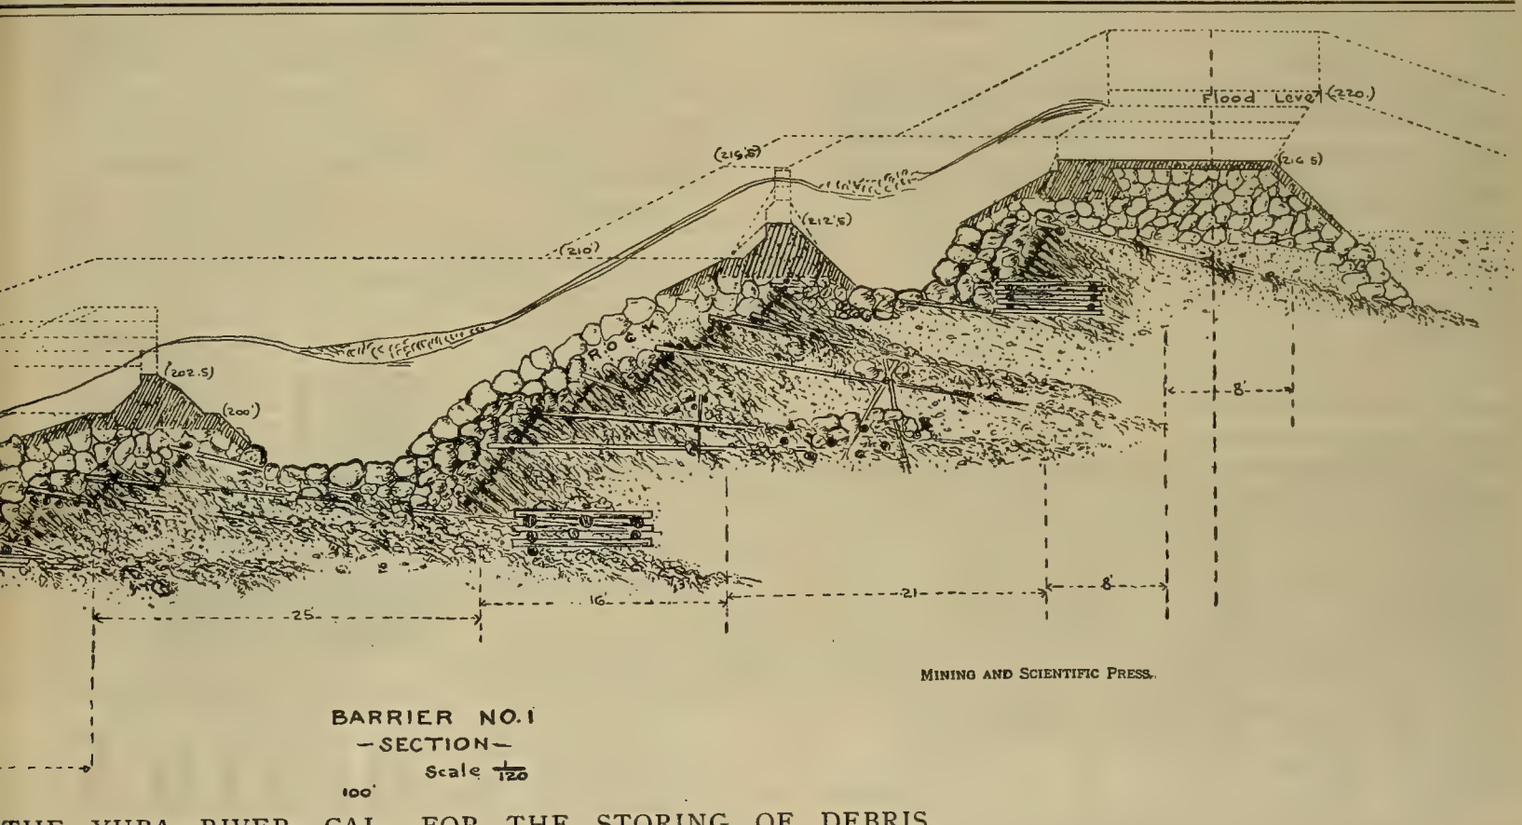
"It yet remains to show the most suitable manner of disposing of coarse material. May it not, after all, be cheaper and more secure, at least in particular cases, to hold this character of material in the principal tributaries, where the watersheds are, compartively speaking, small, rather than in the main rivers, where the flood exposure is considerable? This question has never as yet been carefully looked into.

"The subject under examination is so broad that it may not be wise to attempt to look too far ahead. For, in attempting to cover more ground than is necessary, there exists danger of inaccuracy as well as in covering too little at the risk of overlooking some important detail. Things are liable to develop in a different manner from that assumed. As an instance of this there is the settling basin for storing fine material. In order to make an estimate it was necessary to assume boundaries somewhere and to select a probable level for the storage surface, and accordingly the estimate figures apply to that level, whereas the actual developments would seek the cheaper lines offered by the execution of the works of Division IV. This handicap has been a constant one. In a scheme which is essentially one of gradual developments, which aims to secure economies through the assistance of natural causes judiciously directed, though the facts were recognized, it has not been found easy to give expression to them in casting up figures.

"As regards the barriers for storing coarse gravel, barrier No. 1 with its by-pass is an essential feature of the project of 1899, so styled. Yet, in view of the very considerable cost of the by-pass and its accessories, almost equaling the cost of the barrier part of the work, a serious question may be raised whether it might not be judicious to eliminate the by-pass feature and put more money into the dam. But in that case the principal motive for selecting this particular site falls away, and what is now styled barrier No. 2 should form the lower structure of the system. It is not open to question that more storage could be obtained for less money under this change of plan. Still, the personal bias of the writer leans to the present plan, believing it, though more costly, to be the more secure, and, in the long run, more liable to give satisfaction. The lowest barrier of the systhem, wherever it be located, has to make secure the ones above it, and it is a wide distinction whether over this important structure a 9-foot depth of water is to pass, or only one of 3½ feet.

"Division II has had no works planned for it, but has not been altogether overlooked. As barrier No. 1 is not expected to have any water flow over it except occasionally, and then only during brief periods, it would be practicable to foster growths of trees upon the whole division, clothing with vegetation that which is now a waste of shifting sands, but reserving a width of about 1500 feet to serve as an unobstructed waterway along the north shore. This would furnish an additional and inexpensive method of affording toe protection to barrier No. 1.

"The facilities for conducting operations are exceptionally good, the low-water season lasting usually eight months or more, and affording absolute freedom of action even in the river bed, while the parts of the work not in the river would be subject only to interruptions common to outdoor work. In this district the rainfall is light, snow and frost are absent, and cheap power is assured, for the line of the Yuba Electric Power Co. parallels the works at a distance of about 1 mile, and systems of ditches giving fair pressure exist on each side of the river, while fuel is cheap and abundant and everywhere at hand. But the most economical of all power sources might be an independent air compressing plant.



"Concerning the probable efficiency of the storage works, the successful operation of the settling basin involves a question of transporting solids by water. The security of the upper-river barriers implies that they shall be made to hold back cobbles, gravel, and coarser sand, but not any considerable amount of fine matter. The suspensory matter and silt and finer sands will probably not cause any difficulty in the basins, but there may perhaps exist an intermediate grade too fine to store above, too coarse not to cause difficulty below. It may be appropriate to state that should this prove to be the case the subject has not been overlooked, and is provided for, but it is expected that a classification into two grades may suffice. In concluding this report it may be permissible to enumerate the advantages which may be claimed for the project of 1899:

"It is a project of slow development; it does not expend any considerable amount of money in advance of results; it affords time to acquire experience as work progresses, and in no instance are structures so located as not to make alterations practicable. It husbands the interest account.

"It calls for no works of a daring or experimental type. There are few portions which, if constructed or partially completed, would not produce benefit and be separately operative, even if afterwards neglected, and it does not so store material that the conditions would be worse, should the structure be destroyed, than if they had never existed.

"It is remedial and benefical, creates lands but damages none, and aims to bring about order where there is now no order."

The Commission recommends, for the best interests of the service, that some of the work be done by contract, and that other portions be done by hired labor and purchases in open market.

MINE AND MILL SUPPLIES.
Importers and Manufacturers of Assayers' Materials, Chemicals and Acids, Etc.
CATALOGUE ON APPLICATION.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

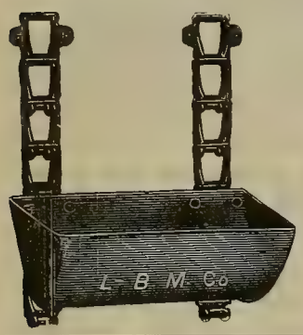
THE IDEAL CONVEYOR BELT



Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

PNEUMATIC SEPARATOR.

Weight, 160 lbs.; capacity, 15 to 30 tons per day.

These machines save the gold WITHOUT THE USE OF WATER, enabling the miner to thoroughly prospect on the spot and successfully work the rich benches and gulches, when water is not convenient. The separation is accomplished by graduated air current. These machines are especially adapted for saving flour and beach gold. No quicksilver being used, the iron-coated beach gold of Cape Nome, so difficult to amalgamate, is saved with these machines as easily as though the gold was clean. Send for descriptive circulars.

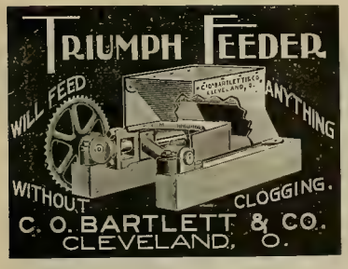
A BORE HOLE

is the cheapest, quickest, most direct, and most effective way to test lands for minerals, oil, gas, salt, sulphur, borax, water, etc.



THE STAR DRILLING MACHINES

excel for these uses. They will drill a hole through anything to any depth from 250 to 2500 feet The only machines made that are absolutely without annoying springs. They are simple, powerful and efficient. Easy to handle at work or on the road. Used in every State and Territory and in many foreign countries.

We also make full line of drill tool-bits, reamers, sand pumps, spuds, etc., etc. Write for illustrated free catalogue.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

(SEE PAGE 724.)

THE

Pelton Water Wheel Company

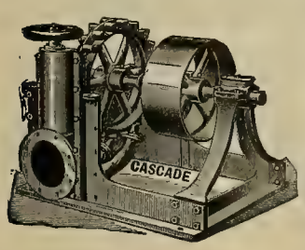
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.



The Pelton Water Wheel Company,

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

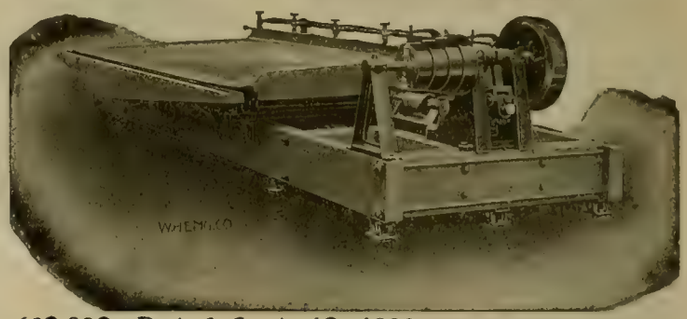
We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.



Ask for No. 1 Catalogue. :: **GATES IRON WORKS,** Dept. UU, 650 Elston Ave., CHICAGO.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

ASSESSMENT NOTICES.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1900, an assessment of seventeen and one-half (17½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of May, 1900, an assessment (No. 25) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 21st day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of May, 1900, an assessment (No. 3) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 310 Pine street, room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of July, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. DREW, Secretary.

Office—310 Pine street, rooms 36, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1900, an assessment (No. 12) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of July, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 1st day of August, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

DELINQUENT SALE NOTICE.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 8th day of May, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Richard Rising	408	1,000	$100 00
W. H. Langford	628	500	50 00
Inman Sealby	614	2,900	290 00
Reese Llewellyn	414	200	20 00

And in accordance with law, and an order from the Board of Directors, made on the 8th day of May, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 213 Jackson street, San Francisco, California, on WEDNESDAY, the 11th day of July, 1900, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

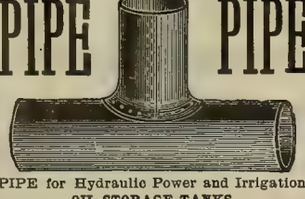
J. MIDDLETON, Secretary.

Office—213 Jackson street, San Francisco, California.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.



THE LITTLE ALASKA GOLD WASHER.

Price $6. Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

The Lunkenheimer "Clip" Gate Valve.

Single Disc DOUBLE SEATED.

Made with Screw Ends from ¼" to 6", Flange Ends 2" to 6" sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely—are heavy and rigid—not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties FREE for the asking.

The Manufacture of Dynamites.

On this page last week appeared a technical description of the method of preparing explosive nitro-glycerine and dynamite. The subject is of sufficient interest to justify continuation. In addition to the dynamites with active absorbents mentioned are what is usually styled "dynamite No. 2," which consists of 18 parts of nitro-glycerine incorporated with 82 parts of a pulverized preparation composed of 71 parts of nitrate of potassium, 10 parts of charcoal and 1 part of purified paraffine, and lithofracteur, consisting of 55 parts of nitro-glycerine absorbed into 45 parts of a pulverized preparation consisting of 1 part of charcoal, 3½ parts of kieselgubr, 2½ parts of nitrate of barium and bicarbonate of sodium, and ½ part of sulphur and manganese. In consequence of the absorbents being active, lithofracteur is more powerful than dynamite No. 1; it is also slower in action. In mining operations it fissures the rock over a large area instead of smashing it within a restricted space. Carbo-dynamite consists of 90 parts of nitro-glycerine absorbed into 10 parts of charcoal made from cork. A high percentage of power is here developed, owing to the fact that 90% of nitro-glycerine is employed, while the absorbent itself is highly combustible. An important claim made for carbo-dynamite is that if it becomes wet exudation does not occur. By reducing the percentage of nitro-glycerine and replacing it by water, it is said that perfect absorption takes place, and that an explosive is produced that can be used with safety in the fiery mines. Carbo-dynamite does not appear to be extensively used. Among other dynamites of the active absorbent class may be mentioned dynamite No. 3, rhexite, meganite, carbonite, stonite, Hercules, Atlas, Vulcan, Judson, etc., there being over 100 different kinds.

Ore Yards at Sirena Mine, Looking Down Tramway from Purisima Tunnel, Through Assorting Ore Shed Toward Mill.

Santa Anna Stopes Below Main Tunnel, Between Soledad Incline and Camargo Workings.

Soledad Incline Shaft Following Vein Down on Its Dip from Main Tunnel (Purisima); Showing Cargadores Packing Ore.

Mining Scenes Near Guanajuato, Mexico. (See page 733.)

There is another class, called gelatine dynamites. Among these is blasting gelatine, which consists of a combination of nitro-glycerine and nitro-cotton. It is manufactured by dissolving finely divided nitro-cotton in nitro-glycerine so as to obtain a clear jelly, the usual proportions being about 8% of nitro-cellulose to 92% of nitro-glycerine, although 10% of the cotton is sometimes used. As nitro-glycerine contains an excess, and nitro-cotton a deficiency, of the oxygen necessary for the complete combustion of the carbon contained in them, the combination of the two in blasting gelatine balances the surplus in the one and the deficiency in the other. There are two varieties of blasting gelatine—No. 1 and No. 2, which is No. 1 with the addition of a nitrate. No. 1 is that generally in use. It is a gelatinous substance of the color of new honey, but varying in its consistency from a tough, leathery substance to one resembling a stiff jelly. The thinner the gelatine is the more sensitive it is to detonation, but at the same time it is also more liable to liquefaction than the tougher kind, and is thus likely to become a source of danger in transport and storage. Blasting gelatine requires specially strong detonators to explode it, and its detonative power can, as a rule, only be developed in confinement. Unlike dynamite, it is difficult to explode a train of it in the open, except by means of a powerful initial detonation. While dynamite and nitro-glycerine are less liable to explosion by a blow when frozen than when unfrozen, blasting gelatine follows a converse rule. It is less liable to freeze than dynamite, and is unaffected by water, an important advantage.

Close of the 80th Volume.

This issue—No. 26—closes the 80th volume of this paper. Perhaps no one of its seventy-nine predecessors is richer in all that made them of value to the mining world than the one closing with this number. The index on pages 757, 758, 759 and 760 shows the multitude and variety of technical topics treated. Apart from the variety of valuable miscellany, is to be noted the number of original articles contributed by men in every department of mining and metallurgy. It is in order to cite a few: "Laccolites and Their Relation to Ore Deposits," by W. H. Storms of California; "Notes on Ore Dressing," by A. W. Warwick of Prescott, Arizona; "Construction of an Upraise," by F. Sletcher of California; "Quicksilver Recovery from Greasy Refuse," by D. B. Huntley of Idaho; "The Switzerland of Colorado," by T. A. Rickard of Colorado; "Bookkeeping for Mines," by S. I. Hallett of Colorado; "On the Concentration of Ores by the Use of Water," by Chas. Taylor of Arizona; "Dredging for Gold, by Theo. F. Van Wagenen of Idaho; "Gold Mining and Milling," by H. V. Croll of Montana; "Outcrops and Croppings," by J. P. Wallace of Oregon; "Treating Refractory Ore," by S. E. Bretherton of New Mexico; "Deadly Gas in Mines" by A. T. Heydon of California; "Cyaniding at El Dorado Canyon," by A. E. Vandercook of Nevada; "Iron Mines of Southern California," by C. H. Hubbs of California; "Masonry Dams and Retaining Walls," by G. T. Pardoe of Sussex, England; "A Door Closed to Miners," by A. H. Ricketts of California; "The California Copper Co." by F. F. Sharples; "Wet Crushing and Cyaniding the Siliceous Ores of the Black Hills," by Jno. M. Henton of South Dakota; "Testing Gold Dredging Ground," by R. M. Downie of Pennsylvania; "The California Oil Industry," by E. H. Rydall of California; "The Divining Rod," by David Kirkwood of British Columbia; "Successful Precipitations from Solutions Weak in Cyanide," by Matt W. Alderson of Montana; "Cheap Mining and Milling at the Spanish Mine," by H. F. Brown of Illinois; "Two Curious Lakes of Nevada," by H. W. Fairbanks of California; "Copper Mining at Placeritas de Nacosari, Sonora, Mexico," by H. B. Layton of Arizona; "Prospectors' Mistakes;" "Sinking vs. Tunnelling in Development Work," by J. M. Johnson of Washington; "Antimony in Austin, Nevada," by W. C. Gayhart of Nevada; "Use of the 'Baby' Air Drill," by H. P. Stow of California; "Mount Whitney, Cal., Electrical Transmission," by. H. G. Parsons of California; "Amalgamation of Metals, Normal and Electrolytic," by J. H. Jory of California; "Southern Oregon Placer Conditions," by Theo. F. Van Wagenen of Idaho; "Some Observations on Practice of the Cyanide Process at Mercur, Utah," by Wm. Magenau of Utah; "Cyanide Plant at Weaver, Arizona," by D. E. Bigelow of Arizona; "Small Mine Concentration," by S. I. Hallett of Colorado; "How to Make a Clinometer," by A. S. Cooper of California; "The Atlin Gold Fields," by J. H. Brownlee of British Columbia; "The Joplin Zinc District of Southwestern Missouri," by J. H. Steele of Colorado; "The 300-Stamp Mill on Douglas Island," by Henry Watson of Alaska; "Outlines of Structural Geology," by J. A. Edman of California; "Matte Smelting Plant at Campo Seco," by Edw. J. Fowler of California—these are among the many articles specially written for this paper during the past six months. From Alaska to Mexico; from the Missouri to the Pacific come practical articles from practical men.

This specialty of original articles is a feature. It is believed that this paper publishes each year a greater amount of original matter from men who are engaged practically in doing the things they write about than any other journal in the United States, and this is one of the reasons for its extraordinary popularity among mining men everywhere.

Patenting Mineral Lands.

The Secretary of the Interior Department sends notice of change in regulations governing the patenting of mineral lands. Every little while the Secretary of the Interior or the Commissioner of the General Land Office changes the interpretation to that time given the Revised Statutes of the United States applicable to mining, and, of course, every one concerned in these matters must know what these latest rulings are and act in accordance with them.

This time it is Section 2322, Revised Statutes of the United States. Following is the statute:

SEC. 2322. The locators of all mining locations heretofore made, or which shall hereafter be made, on any mineral vein, lode or ledge situated on the public domain, their heirs and assigns, where no adverse claims exists on the tenth day of May, eighteen hundred and seventy-two, so long as they comply with the laws of the United States and with State, Territorial and local regulations not in conflict with the laws of the United States governing their possessory title, shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations. But their right of possession to such outside parts of such veins or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward as above described, through the end lines of their locations, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges. And nothing in this section shall authorize the locator or possessor of such a vein or lode which extends in its downward course beyond the vertical lines of his claim to enter upon the surface of a claim owned or possessed by another.

Some time ago the Commissioner and the Secretary ruled on that statute as follows:

1. The rights granted to locators under section 2322, Revised Statutes, are restricted to such locations on veins, lodes or ledges as may be situated on the public domain. In applications for lode claims where the survey conflicts with the survey or location lines of a prior valid lode claim, and the ground within the conflicting surveys is excluded, the applicant not only has no right to the excluded ground, but he has no right to that portion of any vein or lode the top or apex of which lies within such excluded ground, unless his location was prior to May 10, 1872. His right to the lode claimed terminates where the lode, on its onward course or strike, intersects the exterior boundary of such excluded ground and passes within it. The end line of his survey should not, therefore, be established beyond such intersection.

2. Where, however, the lode claim for which survey is being made was located prior to the conflicting claim, and such conflict is to be excluded, in order to include all ground not so excluded, the end line of the survey may be established within the conflicting lode claim, but the line must be run so as not to extend any farther into such conflicting claim than may be necessary to make such end line parallel to the other end line and at the same time embrace the ground so held and claimed. The useless practice in such cases of extending both the side lines of a survey into the conflicting claim, and establishing an end line wholly within it beyond a point necessary under the rule just stated, will be discontinued.

Now the Secretary of the Interior announces that paragraph numbered two of the above "is hereby abolished." It was law and proper procedure from the time the edict was issued, but now it is "abolished."

Paragraph numbered one in the above is amended by latest order of the Secretary so as to read as follows: "The rights granted to locators under section 2322, Revised Statutes, are restricted to such location on veins, lodes or ledges as may be situated on the public domain. In applications for patent on lode claims where the survey conflicts with the survey or location lines of another lode claim and the ground in such conflict is excluded, the applicant not only has no right to the excluded ground, but he has no right to that portion of any vein or lode the top or apex of which lies within such excluded ground, unless his location was prior to May 10, 1872. His right to the lode claimed terminates where the lode, in its onward course or strike, intersects the exterior boundary of such excluded ground and passes within it."

The former ruling was that the end center had to be located on unpatented ground; the new ruling permits the end center to be placed anywhere desirable, but an applicant for patent must exclude from his claim all portions that cover ground already patented. That is, the patentee of a later location has no right to any ores which might be found within the earlier location in all veins which apex ground already patented, but which may be covered by the latest location. Or, in other words, the statute itself is to be interpreted as it reads, and in the light of Supreme Court decisions, irrespective of former or recent opinions of executive functionaries.

No blame attaches to the Secretary or the Commissioner. They doubtless do the best they can with that ridiculous survival of ancient mystery known as "the United States mining law." Some time all this antiquated folly will be flung aside and the whole thing brought into line with modern requirement. Till then we can only announce what well-intentioned guessers in authority promulgate or rescind, according to their lights.

WHENEVER a barren, unproductive surface tract is proved by prospector and miner to be of value, it becomes fit subject for consideration of tax gatherers, and the basis of assessment is often an interesting one. In Cripple Creek, Colo., the Teller county assessor has decided to base the valuation on what is represented by the stock quotations. All sorts of schemes have been tried—taxing the gross product, the net product, the ground itself at an arbitrary value. Now comes the newest notion of making the selling price of the stock the basis of taxation. It will require a nimble assessor to keep track of some mining stocks in their gyrations. Just how he will value a property that is selling its stock one month at $3 and the next at 30 cents per share, is apparently undetermined by the new minded assessor. Nor is it clear how he will assess mining property where there is no stock. If he push his plan to its logical conclusion he will not assess any mine that does not issue stock. If such plan prevails, it will be unfashionable to issue mining stock.

A GENERATION AGO Michael Chevalier startled Europe with a prediction that an immediate glut of gold would demonetize that metal and demoralize then existing systems of finance. Some new Chevalier will doubtless be heard from before the close of the last six months of the century, prophesying that the present flood of gold will overwhelm everything in the world of economics. When Chevalier wrote the annual production of gold was $100,000,000. The gold product for 1900 is estimated to approximate $400,000,000.

THE first steel graving dam in the United States is to be built at the Salmon Trout river, Houghton county, Mich., by the Atlantic & Baltic Co. at their mill site. The steel part will be 475 feet. The dam will have an extreme height of 36 feet on a steel superstructure, which will slope back with the stream at an angle of 56°, forming the dam, which will rise 75 feet above the bed of the stream; walls of earthwork will make the entire length of the dam 1000 feet. The total storage capacity will be 600,000,000 gallons.

Concentrates.

COPPER can be precipitated from chloride solution with metallic iron.

GAS ENGINES of 250 H. P. are not uncommon; they are now built of 650 H. P.

NADORITE is a chlor-antimoniate of lead, sometimes found in connection with zinc carbonate, an uncommon mineral.

THE temperature of steam in steam pipes increases with pressure, and the amount of heat given off therefrom increases proportionately.

NOTHING definite was done by the last session of Congress regarding the California mineral land bill. The measure is just about where it was.

A CONCENTRATED SOLUTION of magnesium chloride should be suitable solvent for cuprous oxide; for cupric oxide try an aqueous solution of sulphurous anhydride.

WATERS injurious to boilers are mainly alkaline, or chalk, water; neutral, or gypsum, water; acid water. The first and second form scale, the last dissolves the plates.

A RHEOSTAT may either start or regulate the speed of a motor. Its function is to protect the armature coils from too much current while they are at rest or slowly turning.

WAVE MOTORS have been repeatedly illustrated and described herein. They work very nicely in an experimental way and have what is to some minds the charm of utter uselessness.

"AMORTIZATION" is a French term for a sinking fund, a mode of provision for contingent expenses in a mining company, as common in Europe as it is uncommon in the United States.

PHYSICAL chemistry may be defined as the science which has for its object the investigation of chemical changes by physical methods. Matter is anything that causes a direct excitement of our senses.

AN electric current cannot be sent through pure water, but the addition of a minute quantity of other matter reduces its resistance. Ordinary water admits of the passage of an electric current through it.

FROM the description of the quicksilver it is evidently fouled by babbit metal, and the only remedy is to retort it. Nitric acid treatment of dirty quicksilver is not relished by millmen, who do not care to be salivated.

IN electricity as applied to power and light for mining the great advantage is that while under former conditions the power had to be generated above where it was used, now it may be generated below the point of use.

THE statement regarding the plasticity of rock on page 639 in the issue of June 9th was scientifically correct. As with other rock, marble, even when dry, and at ordinary temperatures, can, under great pressure, be made to flow.

IN cyaniding an acid ore caustic soda will be found valuable as a neutralizer. Tests can alone determine the necessary amount, though two ounces per ton should be a fair average. About one-half pound each of cyanide and zinc is ordinary consumption.

REGARDING the requisite power to be used in electrolytic precipitation of copper one ampere hour of current should precipitate 1.75 grams copper with either soluble or insoluble anodes, which would merely occasion a slight difference in the required voltage.

THE piston speed of a 14x28-inch engine at 130 revolutions per minute is 66 feet 8 inches. The rule in such a case is to multiply stroke in inches by 2 and by number of revolutions per minute, and divide the product by 12; the quotient is the travel in feet per minute.

TO remove rust from steel immerse the article to be cleaned in a strong solution of cyanide of potassium, mix to the consistency of thick cream a paste of cyanide of potassium, castile soap, whitening and water, and after immersion brush the steel briskly, using the paste.

THE hand hammers used by riveters weigh 4 to 4½ pounds each, and the work done per blow is 58 to 65 foot-pounds per second, four blows being struck in five seconds. Smiths using a 5½-pound hammer strike one blow per second, and do work at the rate of 72 foot-pounds per second.

THERE are necessarily three nozzles in every injector, the actual number varying with the different makes. Those required in all are the steam nozzle through which the steam enters; the combining nozzle, where the steam and water are mixed; the discharge nozzle, through which the water is carried off.

A GRADUATE of a mining school or a competent mining engineer has a right to use the abbreviation "M. E." after his name, but there is no law on the subject. Nothing should be taken for granted, and any unknown claiming employment as an "M. E." should be obliged to give evidence of his right to the title.

THE Best Manufacturing Co., San Leandro, Cal., make a freighting wagon for use with their traction engines; the running gear is wholly of iron and steel, the bed is of wood, although it can be constructed of steel if desired; capacity sixteen tons; the tires are 16 inches wide, ⅝ inch thick; the front axle is a little longer than the rear one, so that the front wheels lap on the track of the drive wheels of the engine about one-half the width of the inner edge; the rear wheels lap about one-third the width of the front ones on the inner edge, thus rolling the road smooth.

A DYNAMO doubtless works better at a low temperature than a high one, as the former keeps the iron cores and copper conducting wires cool, securing greater conductivity. The temperature coefficient of copper is 0.002 per degree F., so that in certain limits copper improves two-tenths per cent for each degree it is cooled.

THE oil wealth of California is incalculable and is being rapidly developed, but care is necessary in investments in stock companies. There are many incorporations offering worthless stock for sale, and investigation before purchasing is essential. In a general way it may be considered unwise to buy stock in any corporation not owning oil land with good title thereto.

ANYTHING of interest to readers of this paper is always welcomed, and where accompanied by photographs, sketches or drawings, such illustrations are carefully engraved for embellishment of the article. "Everybody is wiser than anybody," and every reader certainly has something to contribute of common profit and value to all.

A GOOD CEMENT for leather belting is made by working together ten parts bisulphide of carbon, one part oil of turpentine with gutta-percha, forming a thick paste. The leather where the cement is to go should be unrolled and roughed, and when the cement is put on the ends should be pressed together closely till the cement has well dried.

THE methods employed by the Little Tiger M. Co., Shasta Co., or the Alder Gulch M. Co., Tuolumne Co., Cal., are not such as are usually considered conducive to mutually satisfactory results, but there is no law in Massachusetts or Iowa any more than in California to restrain the credulous or prevent the unwise separation by any man from his money.

WEEKLY REPORTS of authentic mining dividends are given as a matter of news. There is no "charge" therefor, any more than there would be for any other news or information. Announcements of dividends declared are always gladly given publicity. It is impossible to give anything like a full list, as many mining companies make no returns of dividends paid.

HARD-DRAWN COPPER WIRE is largely used in all electrical industries. While retaining properties of conductivity inherent in copper, it has the additional quality of great tensile strength. It aids in long distance telephony and the electrical transmission of energy. The annual consumption of hard-drawn copper wire in the United States exceeds 80,000,000 pounds.

THE central wire in the three-wire system is nominally neutral. The lamps are placed in multiple arc between the two outer conductors and the neutral wire, and are so distributed that the current is the same in both. While this balance is maintained no current flows through the neutral wire, but if it becomes greater in one than in the other the surplus is taken care of by the neutral wire.

IN the case of the St. Louis M. & M. Co. vs. Montana M. Co., 19 S. C. R., 61, the Supreme Court of the United States decided that neither the statute nor public policy renders invalid a contract made in settlement of litigation over a disputed boundary between mining claims, by which one of the claimants binds himself, on obtaining title from the United States, to convey the portion in dispute to the other.

GRAPHITE is reported found in various localities in California, Wyoming, South Dakota and Utah, but the principal source in the United States of the natural product is Ticonderoga, N. Y., where about 1,000,000 pounds are annually produced. An artificial graphite is manufactured in this country from coke, which in some respects is said to be capable of successful competition in price and quality with the natural product.

THE engines of battleship Wisconsin, building by the Union Iron Works of San Francisco, were illustrated and described in the issue of April 29, 1899. The vessel embodies all the electrical features that have been experimentally tried in the older vessels. Her electrical equipment consists of an incandescent lighting system, four large searchlights, apparatus for the operation of the two large turrets, electrical ammunition hoists and powerful electrically propelled fans for the elaborate ventilating system.

IT may be that the late Capt. Thos. Mein made $300,000 in a few years because of his mine knowledge. If he did it was no more than he was worth. Such a sum is not without precedent. Wm. Patton got $60,000 per annum on the Comstock, and there are men living who make $50,000 annually as consulting engineers or mine managers. A big mine might find it true economy to pay the right man $40,000 or $50,000 a year—truer economy than to get an incapable man for nothing. It's all in the mine—and the man.

OF this issue there are printed and circulated 11,284 copies. It is the last issue of Vol. LXXX. It is the 2084th issue of the paper. Next Saturday's issue will be No. 2085, being Number I of Vol. LXXXI, the 41st year of the paper's existence. On the last four pages of this issue appears an index which gives some idea of what was published in our columns during the past six months. A great many are pleased to say that they find enough in any one issue to pay them for what the entire year costs. The contents of two such volumes every twelve months published in technical book form would cost several hundred dollars. The two volumes as published week by week are furnished postpaid for three dollars. If every one who reads his neighbor's copy were to send his name and have the paper come to him individually, the number of subscribers would be over 50,000. In thousands of instances the paper, after being read and passed around, is remailed to be again read and reread in other localities. It were better to save and bind the copies, for in no other way can so much matter of value to the mining world be collected in so cheap and permanent a form.

THE difference between true and apparent level is occasioned by the curvature of the earth and refraction. The correction for curvature is equal to the square of the distance sighted, divided by the mean diameter of the earth—7912 miles. In one mile—5280 feet—the correction for curvature would thus be 8.0076 inches. More accurate data require that the correction for refraction shall also be taken into account, and is to be deducted from the correction for curvature. For a distance of one mile the correction for refraction is 1.1436 inches; hence 8.0076 — 1.1436, or 6.864 inches is the true correction for that distance. For any considerable distance the true correction for curvature and refraction may be had by using the following formula, in which "C" is the true correction in feet, "D" the horizontal distance in miles: $C = \frac{D^2}{1.75}$.

THERE are several rules by which to calculate the volume of water a given sized pipe line with a given fall will furnish, and, for one who knows how much water he requires, to determine the size of pipe required. To answer both questions the following formulas will suffice: For velocity in second-feet for rough pipe, V = velocity, D = diameter of pipe in feet and H = the fall in feet per 1000 feet — $V = \sqrt{D \times H \times 1.5}$. To find the quantity delivered by a pipe line use this formula: $Q = D^2 \times \sqrt{D \times H}$, Q = quantity in U. S. gallons per minute, D = diameter of pipe in inches, and H = fall in feet per 1000 feet. By transposition in the last formula $D^6 = \frac{Q^2}{H}$; that is, that knowing the quantity desired in gallons, and the fall from the proposed head of pipe line to point of delivery, the diameter in inches of required pipe can be found by dividing the square of the quantity by the fall in feet per 1000 feet, and extracting the fifth root of the quotient.

TO ILLUSTRATE the matter of efficiency as compared with first cost in power transmission equipment may be taken the suppositious case of a manufacturing plant where 500 H. P. must be delivered to machines at various distances up to 400 feet from the engine. Taking the efficiency of belts and shafting at 50%, the power delivered by the engine would be 500 ÷ 50% = 1000 H. P. With electric equipment of 70% efficiency the power delivered by the engine would be 500 ÷ 70% = 714 H. P. The engine and boiler for the use of belts and shafting would therefore be of 40% greater capacity than for the electric equipment. The increased cost of engines and boilers for this 284 H. P. increased capacity required with the belts and shafting would be, say, $7000. Belts and shafting for this plant could be made to cost $15,000, which with the $7000 above makes a total of $22,000 to be compared with the cost of electric equipment. Electric generators and motors to deliver the 500 H. P. to machines, together with the necessary wiring and fixtures, if figured at $50,000, would show an excess of $28,000 over the purely mechanical equipment. To offset this $28,000 greater first cost there would be an annual saving of 1000 — 714 = 286 H. P. The value of 286 H. P. per year at $40 per H. P. is $11,440 yearly, or enough to repay the $28,000 increase in first cost of plant in less than three years.

IT is an extravagance to run an engine on a light load, for engine losses are nearly constant, and for light loads become a large percentage of the total. In the majority of small plants, the engines are run for many hours at a light load, but the remedy can only be suggested when all the factors in each individual case are stated. In selecting an engine, if for a variable load, it were well not to get the engine cylinder too large—only large enough for the maximum work it may be called upon to do, and not to get the other parts too small. In the delivery of the steam to the engine many troubles may come up. The steam may start wet and at too low a pressure and become more moist and reduced in pressure before it reaches the engine, or fail to maintain pressure to the point of valve closure, exhaust at too high a terminal pressure, or have too much back pressure. Improvements might be made in many instances by using larger pipe with long bends, steam separators, or by using steam reservoirs close to the engine, well-covered pipe, free exhaust and an efficient feed-water heater. The economical requirements in the production of steam are sufficiently strong boilers, with good circulation, kept clean inside, tight settings, sufficient draft for rapid combustion, grate areas properly proportioned to the output of the boiler and to the coal to be used, feed-water as hot as possible and free from oil, and coal with the greatest number of heat units per dollar of cost in the furnace. The question of coal is one which requires attention as to whether it is positive or negative economy. It may be that a cheap coal is evaporating less water per dollar than a more expensive one, or changes in the furnace might reverse the case, making the cheaper coal a positive economy. In distributing electric energy for incandescent lighting, constant pressure is an important item. It is a common error to maintain a constant voltage at the station, regardless of the varying load.

Cross-Section of Lode in the Valenciana Mine.

Guanajuato, Showing Position of Company's Mill; Tramway Winding Around Sirena Mountain on Right; Also Old Patio or Hacienda de Beneficio in the Foreground.

Purisima Tunnel of Sirena Mine, 5000 Feet Long; Taps Vein at a Depth of 1000 Feet.

Guanajuato Con. Mining & Milling Company's Combination Gold and Silver Mill, in Hacienda de San Francisco

Mining Scenes Near Guanajuato, Mexico.—(See Opposite Page).

A Guanajuato, Mexico, Mining Enterprise.

About 250 miles north of the City of Mexico, State of Guanajuato, is a noted mine—the Sirena, the property of the Guanajuato Consolidated Mining & Milling Co., in the Veta Madre (mother lode) region, worked continuously since 1554. Ancient Mexican mining methods were on vastly different lines than those of to-day. On the Valenciana mine was sunk an octagon-shaped shaft, 36 feet in diameter; on the Rayas one 40 feet in diameter. These shafts cost upward of $1,000,000 each, the lode being in places opened to a vertical depth of nearly 2000 feet, or 3000 feet on the dip of the lode. The lode courses N. W. and S. E., dipping 43° S. W., a fissure following mainly the structural strike and dip of the enclosing country rock. On the opposite page is a view of a cross-section of the Veta Madre in the Valenciana mine, showing a split or division in three distinct ore-carrying veins, the cuerpo de alto or hanging wall, de en medio or middle, and de bajo or footwall ore chimneys or branches; the ore body of the hanging wall considered the lode proper, the center and footwall deposits, spurs of the main vein. The rock locally termed "lozero" is a peculiar feldspathic variety of fine-grained stratified conglomerate; from the Valenciana southeasterly toward the Sirena the lode passes between slate, siliceous slate appearing in the latter in both walls. In the Veta Madre ore are silver glance, ruby silver, gray copper, galena and blende, with copper and iron pyrites in a siliceous gangue, rich, productive zones alternating with barren sections.

At the close of the eighteenth century Valenciana ore averaged 112 ozs. silver to the ton; in the early part of the nineteenth century it carried about 85 ozs.; from 1860 to 1865 it went about 50 ozs.; it now goes from 15 to 50 ozs. Humboldt, who visited the mine about 1822, thought the richest zone would be between the altitude of 6000 and 7000 feet, the subsequent developments not wholly confirming this theory. The most profitable of the Veta Madre ore bodies was stoped out from 1770 to 1800 in the Valenciana; the thickness of the lode was 492 feet; in the Mellado mine the lode developed a width of 300 feet, containing solid ore bodies that measured 200 feet from wall to wall, worked to a depth of 1450 feet. These workings communicated with the Rayas, in which, like the Comstock bonanza, the ore yielded largely in gold. The tiro general, or main working shaft of the Rayas, is about 40 feet in diameter and 1900 feet vertical depth—a unique excavation. The Rayas mine is shown by its books to have paid the King of Spain in royalties over $17,000,000. It is estimated that the total production of the mines mentioned aggregated $862,000,000 from 1590 to 1886.

While from a modern standpoint unwatering the Veta Madre mines would be a simple problem, yet in olden times, as the workings expanded longitudinally and in depth, the high lift and increasing drainage area made the problem a formidable one for the ancient methods according to the standards of serious mining undertakings then ruling. When the "holding of the water" by the use of hide bags, buckets and hand pumps had been interrupted for any considerable period, owing to political or other disturbances, vast volumes of water accumulated in the many miles of extended workings and wide yawning stopes; thereupon, its removal involved, as it were, the draining of a chain of subterranean pools and lakes and became indeed a serious affair. Hence, it finally came to pass that the submerged condition became general throughout the lower levels of the bonanza mines, thus limiting and confining exploitations to the upper workings, viz: from 500 to 1000 feet from the surface, or less than one-half their total depths. This has narrowed down much of the present work to the extraction of the lean ores, remaining as filling and low-grade blocks after the exploitation of the richer deposits in former times.

Various projects for unwatering the Veta Madre mines by projected tunnels and large-scale pumping plants situated at central shafts have been proposed from time to time; and as far back as Humboldt's inspection he recommended the driving of a deep tunnel from Silao, measuring 12 miles, to the mines. Upon the completion of the railway from Silao to Marfil, and from the latter place to Guanajuato, discussions of the tunnel and other projects to reopen these historic mines took on new vigor. The poor saving in gold values that attended the old methods of extraction had also attracted attention to economic possibilities by modern systems of treatment; the only undertaking of recent date to reconstruct any of the more prominent properties is that which the Guanajuato Con. Mining & Milling Co. has in hand, after over two years of work in unwatering its Sirena mine.

At the present time the higher grade ores are shipped from the district and sold for cash to the smelting works of the United States and Mexico—those of the Guggenheim Company at Auguascalientes on the Mexican Central Railroad, about 140 miles from Guanajuato, being the nearest. Ores running over $40 (Mexican) per ton, silver value, are usually shipped out of the district to the smelters; some ores of this class also carry gold. There are also smelters purchasing Mexican ores at San Luis de Potosi and Monterey, Mexico, and at El Paso, Texas—since the establishment of which but a small tonnage of crude ore is exported to Europe. The lower grades make up the great bulk of the product, however, and are worked locally by the ancient patio process in some of the thirty-five or forty reduction works of this type in and about Guanajuato. An inventory taken not many years since showed the aggregate haciendas to contain 60 Chilian mills, 300 large arrastras and nearly 1000 of smaller size; besides hundreds of horses and mules, the plants also included over thirty steam engines, representing 1000 H. P.

The patio plants of the Guanajuato industry are often owned or controlled by others than the mine owners and operated separately from and frequently antagonistic to the interests of the latter on a custom basis of high charges in favor of the hacienda. It is not of infrequent occurrence for the majority shareholders in a mining property to acquire a hacienda and shrewdly operate it on the profitable contract basis of the high treatment charges, somewhat after the former fashion of milling on the Comstock, Nevada; the mine may run behind, but the hacienda does a thriving business—inuring to the benefit, in such cases, of the majority mine owners, who make their profits through the hacienda, while the minority mine stockholders, being non-participants in the hacienda profits, have heaped upon them the unprofitable or mining side of the venture. The debts being, as a rule, carried as a charge against the mine's output, and not, so to speak, as a foreclosure lien against the property itself, the operation may run for a series of years with an ever-increasing debt against the mine, while the working of the latter is supported and encouraged by those in control of the patio. The treatment charge, called maquila, is fixed from time to time by more or less extended contracts. In 1862 and 1863 it was about $28 per monton, or about $18 per ton; even now the charge is not far below this figure, besides which extra expenses are added for loss in quicksilver and cost of transportation from mine to works, and sometimes a still further allowance is made in favor of the hacienda for excessive consumption of salt beyond a stipulated normal quantity, which latter varies from 50 to 100 pounds per ton of ore treated.

The patio process extracts about 90% of the silver and from 30% to 35% of the gold contents in the ores; the whole treatment of the ore takes from three to six weeks—longer in winter than in summer time—which is one of the chief drawbacks from an American view point. From the bullion produced the Government taxes of from 5% to 7% are also deducted before a return is accounted for to the mine. The haciendas, therefore, work as a rule on a sure basis of profit, while the mining enterprises proper have to pay a profit to these customs establishments, the miner rarely enjoying the benefit of having his ores treated at actual cost by the mine's own plant, operating exclusively in its interest. The Guanajuato Con. Mining & Milling Company owns its own mill of modern design, (see engraving on opposite page), operated exclusively in the interest of its own properties, and thus escapes this customary tax, which in effect is a forfeiture of part of the mining profit.

The transportation of the ores from the various mines to the haciendas is done entirely on the backs of mules, requiring therefor great numbers of animals, which, with their heavily laden rawhide sacks, often block the narrow streets so as to render them almost impassable. An exception to this method of transportation, and the only one in Guanajuato, is the plant illustrated, which also includes the connecting of the Sirena mine with its new combination gold and silver mill of the M. B. Boss type by a surface tramroad 3520 feet long.

(TO BE CONTINUED.)

Outlines of Structural Geology.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by J. A. EDMAN.

SECOND STAGE — CONSOLIDATION AND METAMORPHISM.—During and after the subsidence of the strata thus formed, and when gradually exposed to increasing heat and pressure, the presence of the original moisture accelerates chemical activity, and new mineral combinations would form within the various strata, organic matter when present causing a continued deposition of metallic sulphides through the mass, the formation of various silicates and the gelatinization of the silica when abundant in minute division. Most of the amorphous acidic rocks would become plastic, and when earth movements occurred, occasioning faulting and folding, with fissuring and crushing of the harder strata, the most plastic portions of the rocks would move toward the open spaces, while the still more mobile silica would carry with it much of the sulphides in suspension and solution.

Under the conditions then prevailing the fissures caused by dynamic action would be filled largely by the silica exuding through the pores of the rock, and also by other silicates, and the crushed rock fragments would be recemented. Beds of gravel, and even conglomerates, have under such stress and movements lost their physical features and become homogeneous; tuffs have been consolidated into greenstones and fossiliferous limestones been transformed into crystalline marbles. Superheated steam would form and exert active influence on these processes, but it is not probable that any bodies of hot circulating water from below could exist at great depths, the best evidence of which is that the deeper-seated fissures forming at this and subsequent stages carried, not hot solutions, but mineral matter in fusion. Hot waters may, however, have been active, but they would be derived from the percolation of surface water into open fissures reaching to considerable depths, and such waters, as well as those of lower temperature, may have carried silica as well as metallic salts into fissures, there to be precipitated and solidified.

A definition of the term "secondary quartz or silica," often used, seems necessary. The term refers to quartz or silica formed subsequent to and within an enclosing rock of whatever nature. Its general formation results from exudation or infiltration of silica from surrounding rock, or from a soluble rock being replaced by silica, which takes place precisely in the same manner as when a buried tree is petrified.

The term "vein quartz" is a misnomer. What is so called is simply silica which is nearly pure and has crystallized slowly. It is found under all conditions and everywhere among the metamorphic rocks, while hornstone, or flinty silica, also forms the gangue of many metalliferous deposits.

Not only the sedimentary beds, but the igneous masses alternating with them, would partake of the general metamorphism, but the latter in different manner and degree, chiefly owing to the fact that they carried less free silica than the sedimentaries.

In most instances metamorphism would obliterate all fossils in the sedimentary rocks and their ore deposits, specially through the crystallization of the limestones, and only rare instances would occur in which stratification previous to or during the first stages of subsidence had rendered the fossils resistant to physical and chemical forces, and thus in condition to be ultimately recognized.

Under the conditions affecting the strata during the second stage, a concentration of metalliferous minerals would occur in many sedimentary beds and

Table of Dimensions and Resistances of Pure Copper Wire.

The Electric Furnace.

The electric furnace is passing out of the experimental stage, and is meeting with practical success. There are several distinct types, in one of which the intent is to control the position of the arc between electrodes by placing it in a magnetic field. In a furnace illustrated herewith the arc is made to traverse to and fro at right angles to the direction of the current. This is shown in Figs. 1 and 2, the first indicating the application of the principle, the second giving a cross-sectional view of a traversing multiple arc furnace. Referring to Fig. 1, C^1 and

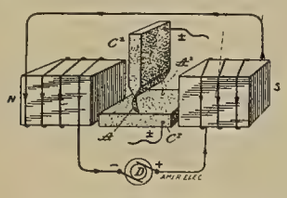

Fig. 1.—Magnetic Control of Arc.

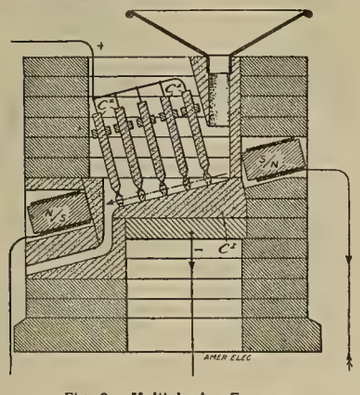
C^2 are carbon slabs given the shape of rectangular blocks and placed at right angles to each other at arcing distance. The arcing space is placed in the field of the magnet N S, and this will hold the arc in the position A^1, its tendency being to go out of the magnetic field in a direction at right angles to the lines of force. If, however, the magnet is turned through 180°, so that the relative positions of the N and S poles are reversed, the arc will then go over to the position A^2 at the other side of the magnetic field. Evidently, then, if the magnet N S could be revolved or spun around the vertical middle line of the carbon slab C^1, then the arc would, in order to get out of the changing magnetic field, move to and fro across the lower edge of the vertical carbon, and thus be kept reciprocating as the magnet revolved.

It is not necessary to revolve the magnet, as described, to get this result, as it would do just as well to let the magnet remain fixed in position and reverse the magnetism periodically; there are always two ways of accomplishing the same result without moving any part; it matters not whether we put a direct current between electrodes and reverse the field magnetism periodically, or let the magnetism remain constant and periodically reverse the direction of the current between the electrodes. Thus, if we use an alternating current for the furnace work, an ordinary electro-magnet of unchanging polarity embracing the arcing space in its field will cause the arc to reciprocate from side to side with each reversal of the current direction.

Fig. 2 indicates a multiple arc furnace involving



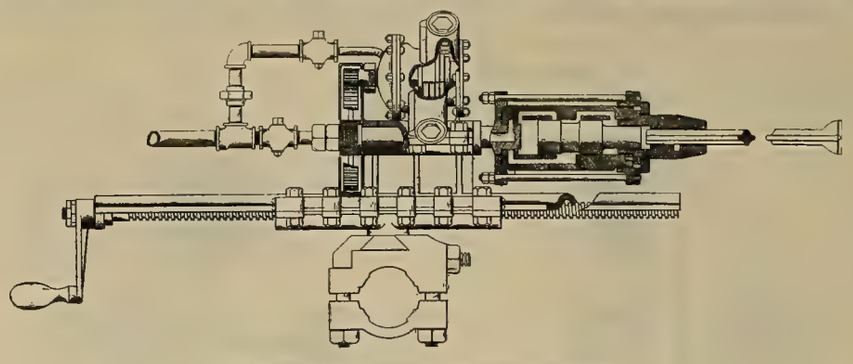


Fig. 2.—Multiple Arc Furnace.

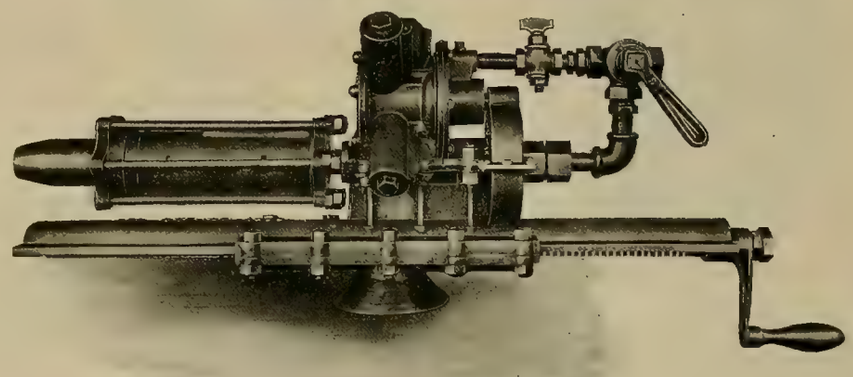
this principle. A number of carbon slabs, C^1, are arranged parallel to each other, at right angles to another, C^2, that forms at the same time the inclined base of the furnace and an opposite electrode to all the others. The magnet N S is built into the furnace walls in such a position as to embrace all the arcs in its magnetic field. If direct current is used between electrodes to do the smelting, then the magnetism of the surface magnet is slowly reversed, causing the arcs to move to and fro across the furnace floors. An interesting variation is to connect the upper or vertical electrodes in series in such a way that the current flows up in one, and at the same time down in the next, and so on throughout the series. Under these conditions one arc will be going from right to left across the furnace base while the other is going in the opposite direction from left to right.



THE silver yield of British Columbia amounted in 1899 to 2,939,413 ounces, 4,292,401 ounces in 1898, value $1,663,708 and $2,375,841, respectively, a decline of value of nearly 30%. There was a simultaneous fall in the output of lead, usually there mined with silver together with combined ores, which was of value of $878,870, as against a worth of $1,077,581 in 1898. The decline in lead output value thus amounted to over 18%.

The Schmucker Pneumatic Rock Drill.

The Great Western Pneumatic Tool Co., of Denver, Colo., are manufacturing three sizes of the Schmucker drill, which are being tested in the various mining districts of Colorado. The size No. 1 weighs 35 pounds and strikes a blow equal to 31½ pounds; No. 2 weighs 55 pounds, delivering a blow of 49 pounds; No. 3 weighs 80 pounds, striking a 71-pound blow. The accompanying illustrations give a general idea of the

Sectional View Schmucker Pneumatic Rock Drill.

Schmucker Pneumatic Rock Drill.

mechanism of the drill. The manufacturers claim for it an air consumption of but 14 cubic feet of air per minute in size No. 1, 26 cubic feet for No. 2 and 34 cubic feet for No. 3. The hammer piston strikes, it is claimed, 4000 blows per minute. The diameter of hammer is 1⅛, 1 5/16 and 2⅛ inches, respectively, for the different sized drills; the length of feed is 18, 24 and 28 inches in the three different sizes, and will drive a hole from 4 to 12 feet.

The drill is rotated by a small four-cylinder engine, shown at the top of the machine, which operates independently of the striking device in the cylinder on the left. The engine shaft revolves at the rate of 812 revolutions per minute. A spiral steel sheath, surrounding the steel and rotating with it, acts like a wood bit in expelling the rock clippings from the hole as fast as they are made. By the lightness of the blow, it is claimed, a bit of maximum hardness can be used without breaking and thus reducing the wear.

WASCOTT.

Denver, Colo., June 25.

Discouraging Wholesale Filings.

Miners, generally, will applaud a recent decision of the Commissioner of the General Land Office, overruling a decision of the Register and Receiver of the Land Office at Prescott, Arizona. D. H. Moffatt had filed application for patent for thirty-nine mining claims and twenty-three millsites, all covered in the same application. M. Scanlan and others protested against the issuance of patent for two of the claims which covered the site of the town of White Hills, alleging that the required assessment work had not been performed, and that the land was non-mineral in character. The local Land Office decided for the claimant; the Commissioner of the General Land Office reversed those findings. We are not sufficiently acquainted with the facts in this particular case to correctly say which was right, but it is manifest that mining development and individual rights therein are often hindered by the attempt to monopolize and hold large areas with no intent to comply with the liberal requirements of Federal mining law. It is too common a practice to make a large number of mining locations, and tie up the tracts by disputed possession, often more with a view to the value of the timber thereon than with any idea of legitimate mineral development.

The Electrical Precipitation of Gold on Amalgamated Copper Plates.*

The precipitation of gold from cyanide solutions on mercury or on amalgamated copper plates by the aid of a current of electricity suggested itself to the inventors of the Siemens-Halske cyanide process before their results were published. Von Gernet, however, stated that such cathodes were unsuitable, the objections to their use being that mercury is too expensive, and that under the influence of the current, gold is forced into the interior of the copper plates, and forms dry amalgam, which does not adhere to the surface.

In the Pelatan-Clerici process, which was used at the DeLamar mill in Idaho in 1897 and 1898, the cathode consisted of a bath of mercury, but the density of the current is not stated. One of the difficulties encountered is said to have been that the gold passing through the bath of mercury adhered firmly to the copper plate lying beneath, and could not be easily detached. E. Andreoli, in 1897, spoke of the use of copper plates, but gave no details of his experience with them. In other patented processes the use of amalgamated plates is involved, and in one, the Keith process, the density 0.06 ampere per square foot of cathode is mentioned as suitable. In view of the discrepancies in the statements given above, it has appeared to the author of this paper that the results of some experiments made on the subject may be of interest to members of this Institution.

In some preliminary work it became evident that, as might be expected, the density of the current is the main factor which affects the electrolytic precipitation of gold on any cathode. The effects of the variation of the density of the current in depositing gold on mercury and on amalgamated copper cathodes were therefore studied, and subsequently lead and amalgamated copper were compared under similar conditions.

The details of these experiments were as follows:

No. 1.—Three baths were used, Nos. 1 and 2 containing as cathodes baths of mercury, each 20 square inches in area, with amalgamated copper plates lying submerged in them. No. 3 contained an amalgamated copper plate about 3¼ inches by 5 inches. The anodes were of the same size as the cathodes, and consisted of carbon in Nos. 1 and 3 and of iron in No. 2. The electrolytes were strong cyanide solutions, Nos. 1 and 2 containing 0.4%, and No. 3 0.7% KCy. In addition No. 1 contained 10% of common salt, and all three contained ten ounces of gold per ton. A current of 1.5 amperes per square foot was passed for 24 hours, the fall of potential in the baths being 1.7 volts, with a distance of 3 inches between the electrodes.

*A paper read by T. K. Rose before a recent meeting of the Institution of Mining and Metallurgy.

(TO BE CONTINUED.)

MINING SUMMARY.

ALASKA.

G. W. Garside, at the Sumdum Chief, has the 10-stamp mill crushing fifty tons of rock every twenty-four hours, running from $6 to $20 per ton. Forty men are employed.

ARIZONA.

COCHISE COUNTY.

The Copper B. M. Co. of Cochise, in the Dragoon district, has returns from a shipment, giving $64 copper, $1.95 and $5.70 silver.

At Johnsonville Hooker & Schwertner have bought the Magazine and Peoples Party claims from Osborn & Bigler for $30,000, ten per cent was paid cash, the balance in one year. The ore contains 20% copper and one ounce of silver to the ton.

MARICOPA COUNTY.

In the suit of S. R. H. Robinson against the Minnesota and Arizona C. Co. for services as superintendent from April 11, 1895, to September 5, 1898, at Phœnix, the jury rendered judgment for the plaintiff for $11,550. The defendant's estimate of the value of the superintendent's services during the existence of these contracts was about $75 per month.

MOJAVE COUNTY.

Near Chloride Supt. Botsford has ninety-six men at work.

At Kingman H. Lovin has sold his one-half interest at Little Meadows to T. Ewing for $2500.

YAVAPAI COUNTY.

The final payment of $38,750 was made last week to the former owners of the Cliff group of mines, near Jerome, consisting of seven claims, by the Treadwell M. Co.

Supt. Gunn says the shaft on the Copper Hill mine is 250 feet deep, and that he finds it difficult to get good miners.

The sale of the Congress mine has not been made. An option for $1,500,000 has been taken by promoters who hope to place the property.

The United Verde dividend of 75 cents per share on the 15th inst., amounting to $225,000, makes $375,000 this year and a total of $1,837,500.

J. L. Giroux of the United Verde mine at Jerome has bought claims adjoining Copete for W. A. Clark.

CALIFORNIA.

AMADOR COUNTY.

The Kirkwood M. Co. will begin work next Monday, July 2d. An upraise will be made from the tunnel to the surface, after which sinking will be continued to a depth of 1000 feet.

Record: The new shaft on the Fremont Con., at New Chicago, is down 300 feet; a hanging wall of greenstone has been encountered. A concrete shaft is being laid for the new hoisting works at the old shaft. Supt. Purrington hopes to have the new hoist running by the middle of July.——At the Gwin mine an ore body has been struck in the south drift of the 1600 level in the north shaft.

BUTTE COUNTY.

Blodgett & Grose, at Forbestown, will do the concrete work for a new 20-stamp mill at the Gold Bank mine.

CALAVERAS COUNTY.

A strike is reported at the Golden Eagle mine, at Jenny Lind.

At Campo Seco Mgr. Carpenter is operating the Berdina mine, owned by a New York company. The ore is very high in sulphurets and free gold.

EL DORADO COUNTY.

The Cambrian mine, at Lotus, is employing men who are developing the property. The 10-stamp mill is running night and day.

FRESNO COUNTY.

Fresno Democrat tells of a rig for drilling oil wells, the principle being that of a drill attached to the end of a 4-inch pipe, the latter being used as a shaft with which to turn the drill. As the depth is increased new lengths of pipe are added, the weight resting upon the drill, being regulated by the machinery on the surface. Into the top of the string of pipe is continually pumped a stream of water, which, under pressure, goes down through the pipe, and escaping through holes in the sides of the lower end of the pipe, comes up on the outside, bringing to the surface the drillings.——On the Florence property in the Kettleman hills this rig is said to have gone down 680 feet in forty-three hours, 80 feet through a siliceous formation struck at 470 feet, at the bottom of which was about 3 feet of quartz. The cost of the labor in the drilling of this well with this machine is stated to have been $370.

KERN COUNTY.

The Randsburg Exploration Co. has bought one-half the Clifton mine from Martin & Hill, of Garlock.

MADERA COUNTY.

W. H. Thomas, operating the smelter and copper-bearing properties at Dalton and Madera says of his California proposition that it has developed, and is responding in a manner equal to every expectation. He is putting through 120 tons of copper ore daily, and sending out ore that averages about 25%. He says the company will install a set of roasters.

MENDOCINO COUNTY.

C. W. Schumacher of Denver, Colo., is examining a manganese mine near Ukiah.

NEVADA COUNTY

The Reward G. M. Co. has levied an assessment of 2 cents per share, delinquent July 23.

PLACER COUNTY.

A contract is to be let to extend the Baker tunnel in the ground of the Blue Lead G. M. Co. of Dutch Flat.

Machinery is being transferred from the Gold Note mine, Grizzly Flats, to the Three Star mine, Auburn.

Colfax Sentinel: At the Pay Streak mine, Humbug Canyon, a 1200-foot flume 2x3 feet supplies power for a 5-stamp mill to be erected with provision for twenty stamps. The ledge averages 4 feet.——At the Pleasant and American Bar river mine, Middle Fork American below Michigan Bluff, the work of extending the tunnel is in progress.——The Blue Lead Gravel Co. of Dutch Flat have been taking out rich gravel. A contract will be let to extend the Baker tunnel. S. C. Jordan is Supt.——Rich gravel has been struck in the Dardanelles drift mine.——The stamp mill at the Rawhide mine, Texas Ridge, is running steadily.——Supt. Quigley has a new hoist in operation at the Glen gravel mine, near Bald Mountain. Ten men are employed.——At the Prairie Flower quartz mine at Canada Hill, 18 men are employed. A steam engine is being added to run the mill, which, it is expected, will be started by July 4th. The company is building a telephone line from the mine to the Forks House.

PLUMAS COUNTY.

In Kellogg ravine the quartz mine has forty men at work. Supt. Van Light expects to put up a 10-stamp mill. He has a rotary, and chlorination works.

The Rich Bar Gravel M. Co. has levied an assessment of 6 cents per share, delinquent July 30.

At the Little Jamison mine fifty-five men are employed; twenty stamps are crushing ore. The company has let a contract for 30,000 feet of timber and 25,000 spiling.

SANTA CLARA COUNTY.

The Quicksilver M. Co.'s report shows that on June 1 the company had cash on hand of $71,200 and quicksilver to the amount of $20,367, a total of $91,567. The company has no debt. The property worked is at New Almaden.

SHASTA COUNTY.

Free Press: The Minnesota Con. mine, Flat Creek district, between Keswick and Iron Mountain, has been bonded for sixty days by D. McCarthy of Keswick to Day & Caldwell of San Francisco for $60,000.

SIERRA COUNTY.

Operations have been resumed at the Harper mine, Forest City.

The Saddle Buttes has been bonded by P. Keeffe of Sonora.

SISKIYOU COUNTY.

Yreka Journal: A Pittsburg company has paid the bond held on the Sterling mine, Cottonwood district, and has bonded the Pool quartz mine, same locality, for $25,000. The Sterling mine has paid well during the prospecting term of bond, under the superintendency of S. J. Fore, hence the bonding of the Pool mine, with probability of buying the Hitt mine.

Work has started on the dredger in Yreka creek, near Hawkinsville.

TULARE COUNTY.

C. S. Cox of Yellow King M. Co. says they have a large body of high grade ore, the crosscut now in 8 feet of good ore. The company will put in steam-hoisting machinery and a quartz mill.

TRINITY COUNTY.

The mill at the Yellow Rose of Texas mine is running under the superintendency of George Carr of Carrville, who reports his Huntington mill satisfactorily working the talc.

TUOLUMNE COUNTY.

In the $25,000 suit of Mrs. C. Keast against the Santa Ysabel M. Co., in the Superior Court, the jury found for the plaintiff for $8000. Keast was working in the bottom of the Santa Ysabel shaft when he was struck and instantly killed by a timber which got away from the men who were about to lower it. It was argued that the accident was due to negligence, in that the hooks were not properly placed.

The Standard Con. of Bodie had bonded the Blue Bird mine, but the company threw up the bond after it had done considerable work. The Mono county papers say that recently 4 feet of good milling ore was struck only 10 feet from where the Standard Con. knocked off work on the vein.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence). — The Gold Fissure G. M. Co. are operating the Gold Fissure group of five claims. They are preparing to sink a 3-compartment shaft to 300 feet depth, erect a shaft house and put in hoisting machinery. They expect to cut a well-exploited ore body at 75 feet depth.

The Gold Dirt, leased to Cutting & Co., has been shipping for a year and run a concentrator on the property.

The Conqueror group is being operated, which includes a 40-ton mill.

The Silver Mountain has been operating for two years by two Boston ladies, who are making a success of it. It includes a well-equipped mill, in charge of F. G. Bishop.

Empire, June 25.

Regarding the Con. Stanley M. Co., an Idaho Springs correspondent says that the purchase price of the property was $750,000; that there was no commission to C. A. Gehrmann or any one else; that at a Chicago meeting of the stockholders a vote of confidence in C. A. Gehrmann was unanimously carried, and that the intending purchaser is in possession of the property and expresses his intention of making the final payment.

Idaho Springs Gazette: The Franklin County mine, near Lawson, is shipping 400-oz. silver ore.——The levels have been retimbered at the Senator at Dumont and the tramway connecting the mine with the mill is about finished. The company has completed the erection of the mill building, but the machinery has not arrived. Mgr. Kemp will work about forty men in development. He has the Blue Ridge and Senator mines in readiness for stoping. It is estimated that over 100,000 tons of mill ore is broken down ready for moving. Development of the two properties now aggregate several miles of levels.——Mgr. Ward is developing the Dover mine.——The John Owen M. & M. Co. propose to work the vein recently cut in the Newhouse tunnel.

CHAFFEE COUNTY.

Granite Pay Streak: At the Quo Vadis, Mgr. Corey is giving personal supervision to the mine.——Mgr. Barrick of the Magenta is expected to resume operations, when the shaft will be continued to a depth of 500 feet.——The lessees of the California have a vein with pay streak of 2½ feet milling ore, with a smaller streak of smelting ore.

DOLORES COUNTY.

Near Rico, F. A. McNeill sold to MacKinney, Thompson, Montgomery, Kim & Moore a one-fourth interest in the C. H. C. group of mines in Elk creek basin, and has bonded and leased them another one-quarter interest. The C. H. C. mines adjoin the Special Sessions group and are above timber line.

FREMONT COUNTY.

The Rocky Mountain Smelting Co. at Florence expect to be ready to begin Nov. 1. They will have two furnaces 36x180 inches each in dimensions, with a capacity of 250 tons each per day. The smelter building will be 235x75 feet, entirely of steel. The treatment is to be on copper-iron basis. F. R. Carpenter will be consultant engineer. They will not refine the matte.

GUNNISON COUNTY.

At Vulcan, Young & Baker are pushing the Oakland tunnel, developing the extension of the Humboldt vein.

The new hoister on the Vulcan mine is operating satisfactorily.

The Good Hope hoister will enable the company to go 1000 feet.

M. W. Johnson is sinking and timbering a shaft on the Jasper Chimney. Solfataric and geyser action give evidence of a chimney similar to that which appears on the Vulcan mine.

HINSDALE COUNTY.

In the vicinity of Lake City five working tunnels are under way; the longest will be 3000 feet when its objective point is reached. Two are being run by A. E. Reynolds to cut the Ocean Wave vein and tap the Lakeview.

The Hidden Treasure M. & T. Co. has bought the Dewey interest in the mine and mill, three-fourths, price $125,000 cash. P. C. McCarty is local manager. P. M. Holland, foreman. The new tunnel has been started. It will be run 4000 feet and will tap the ore bodies 640 feet below the present workings. Then the tramway will not be used any more. A twelve-drill air compressor will soon be added.

LAKE COUNTY.

(Special Correspondence).—In the issue of June 16, in Leadville correspondence, reference was made to royalties paid by Leadville lessees. The following is a fuller and more specific statement of the matter: On ores yielding up to $10 per ton, net smelter returns, 10%; $10 to $25 per ton, 15%; $25 to $50 per ton, 20%; $50 to $100 per ton, 25%; $100 to $150 per ton, 30%; all over $150 per ton, 35%. As indicated, all royalties are figured on net smelter returns.

Leadville, June 19.

(Special Correspondence).—The Nil Desperandum, on Rock hill, has a 600-foot shaft, from which drifting proceeds on the blue lime and porphyry contact. The ore there comprises lead carbonates, with some chloride of silver. No water is encountered at this depth. It is likely the shaft will be sunk, later, to the second contact, which it is thought will be reached at 250 feet greater depth.

Leadville, June 21.

PARK COUNTY.

A. S. Bedell has a dredging machine on Michigan creek at the foot of Mount Gill. It is an endless chain bucket dredge, built on a car with a 9x12 revolving table, cutting about 40 feet wide. The dirt is dry as it is cast upon the table, washed then from a centrifugal pump, which carries it to the sluices riffled to catch the coarse gold. The fine gold which escapes the riffles is to be amalgamated on galvanized copper plates at the end of the sluices. He expects to save all the black sand. The machine is built to daily handle 250 yards. He has 120 acres of ground that he thinks will average 25 cents a cubic yard.

PITKIN COUNTY.

(Special Correspondence).—The ore output of Aspen mines amounts to about 13,000 tons per month, consisting of one-eighth concentrates and two-thirds crude ore. The ores are lower grade than formerly, the bulk of the production being by lessees. The product averages 25% to 30% lime, with some iron, which is paid for by the smelters at the rate of 10 cents per unit; the smelter treatment being $3 per ton, this element of lime reduces it to about 50 cents per ton. The lead values probably do not average over 5%. Most of this, however, is reduced to a concentrate, the mills of Aspen shipping about 150 tons per day. The silver values in the crude ore run not over twenty-five ounces as an average. Royalties paid by lessees at Aspen range from 10% to 70%, but the average is about 25% on net smelter returns. WASCOTT.

Aspen, June 22.

SAGUACHE COUNTY.

The San Luis Valley L. & M. Co. will put in a mill at the Independent mine on the Baca grant. The Chapman company of Creede has contracted to transport 1800 tons of lumber and machinery for the mill.

SAN MIGUEL COUNTY.

In April the Tom Boy gold mines near Telluride raised and crushed 5000 tons of ore, yielding $52,000; concentrates shipped, 208 tons, from which the net profit was $2500; expenses for the month, $32,670, leaving a net profit of $23,300. The Tom Boy has purchased the Baby Elephant claim for $5000. The main office is in London.

At Telluride the Smuggler-Union M. Co. has bought the Newport placer, comprising 150 acres, for $12,000.

SAN JUAN COUNTY.

Standard: Grading from the Silverton Northerly Railway to the site of the Kendrick-Gelder smelter is completed. Twenty-four men are grading for the smelter buildings.——At the Henrietta mine, the copper properties of the Paradox M. Co., in Prospect Basin, has twenty-eight miners at work.

SUMMIT COUNTY.

Breckenridge Journal: Four steam-power churn-drills are at work on the placers owned by or under option to the Gold Pan M. Co.

TELLER COUNTY.

W. S. Stratton is now locally credited with intention to sink two shafts, each 3000 feet deep, one on the Logan, the other on the American Eagle, near Victor.

T. A. Rickard, consulting engineer Stratton's Independence, Ltd., from Victor, says that the mine produced during the first year of the new company, ending April 30, 1900, 37,987 tons ore, worth $2,786,255, or $73.35 per ton=3⅜ ounces gold per ton.

Mgr. Wm. Newell of the Cripple Creek-Buffalo G. M. Co., which has driven a tunnel 3000 feet into Grouse mountain from the surface, has decided to go to a depth of 1000 feet, connecting with the tunnel.

IDAHO.

ADA COUNTY.

The next session of the International Mining Congress will be held at Boise.

BLAINE COUNTY.

Burr Rumsey is Supt. the Fisher mine, below White's hot springs, Sawtooth City,

vhere a mill is to be built. Mr. McEntyre vill superintend the construction of this nill. Part of the machinery is already on he ground and the remainder will arrive by the time it is needed.

CANYON COUNTY.

Ex-Gov. McConnell says his company has "almost decided to build a smelter at Tampa."

LATAH COUNTY.

At Moscow is organized the White Cross M. Co., D. S. Elder secretary, to work property of the company on Moscow mountain, 10 miles from Moscow. The ore body is 2 feet wide and assays $22.

SHOSHONE COUNTY.

B. N. Hillard and A. Hight have deeded to the Cœur d' Alene M. Co. the placer claims, water rights, pipe line, etc., on Eagle and Pritchard creeks. The amounts named in the deed are nominal, but the revenue stamps attached amount to $1000, indicating an actual value of $1,000,000. The properties include 100 placer claims, a dozen water rights, covering practically all the headwaters of Pritchard creek, and the pipe line of the Spokane H. M. Co., from Raven below Murray, five miles. The pipe is 16 inches in diameter.

At Mullan Larsen & Greenough, owners of the Morning and lessees of the You Like mines, have acquired a controlling interest in the Gold Hunter mine and mill.

At Burke the Standard M. Co. is putting in a crosscut tunnel, branching off from the Campbell tunnel, 1500 feet from the portal, leaving that tunnel at an angle of 66°, which is calculated to reach the standard vein in about 1000 feet, also cutting it 1000 feet east of the Campbell tunnel, the two crosscut tunnels and the drift in the vein making an equilateral triangle, the object being to cut off 1000 feet of the haul on the ore from that vicinity by following one angle of the triangle instead of two.

At the Custer mine a tunnel 2000 feet is now in progress from the Nine Mile side, to cut below the old workings, from which the Custer shipped ore steadily for years.

At Wallace the Bimetallic M. Co. is running a 550-foot tunnel on its Nine Mile property.

The Mayflower M. Co. at Wallace—H. E. King, H. E. Howes, R. N. Dunn, W. H. Billingham—will operate.

WASHINGTON COUNTY.

At Cuprum hoisting machinery for the Blue Jacket mine is installed. Ore is hauled to the railroad for shipment to the smelter.

MICHIGAN.

Houghton reports that the average of a number of assays of stamp sand or tailings from the Franklin mill was $\frac{5}{8}$ of 1% copper, and that the process recently introduced there for separating this copper from the sand is a success. Those interested believe they will be able to secure $\frac{5}{8}$, or ten pounds of ingot copper, from each ton of sand.

MONTANA.

MADISON COUNTY.

At Rochester there are fifty men employed in the Wauseka mine.

A strike on the Bradley claim on Mill Creek, 10 miles east of Sheridan, shows a solid ledge 2 feet in width, the ore assaying $000 to the ton.

NEVADA.

DOUGLAS COUNTY.

Wilder & Jessen have bonded their mine in Red Canyon district for $10,000 to John R. Loosley of San Francisco, who has let a contract to run a tunnel 100 feet.

ESMERALDA COUNTY.

At Siegelville, the new hoisting engine in operation; ten more men have been put on.

HUMBOLDT COUNTY.

Supt. Terhune, resident manager and supt. at Golconda of the G. & W. E. Co., says the smelters are running at full capacity. The miners at the Adelaide have been laid off, but most of the men have been put to work on the company's Copper Canyon and Copper Basin mines.

LANDER COUNTY.

The management of the Battle Mountain Co.'s property will begin the sinking of a main shaft: a gasoline hoist will be put in.

The Tenabo Co., of Cortez, has raised the wages of the miners from $2.50 to $2.75.

LINCOLN COUNTY.

From Salt Lake comes an unlikely rumor that the De Lamar and the April Fool at De Lamar are considering the consolidation of two properties.

The Homestake and Sheeptrail mining companies have each a 20-stamp mill located a mile from the bank of the Colorado river. A pumping plant on that river supplies the mills with water.

STOREY COUNTY.

J. Fisher has bought for $1000 the ore tailings at the base of the Sierra Nevada mine waste dump from the Sierra Nevada M. Co. and will haul them to his cyanide mill in Six-mile canyon. The tailings pile contains 17,000 tons and will net $5000.

WASHOE COUNTY.

Reno reports the Wedekind ore assays: Main ledge, $1207.80; side of ledge, $265.14; country rock, $7 to $18.75. A cut has been run 64 feet. The ore has been breasted out for 27 feet and exposed 17 feet. Mr. Wedekind shipped 2525 pounds to Salt Lake and received $187.67 net for it. Six tons and 209 pounds were milled at the Reno Reduction Works; $1200 in bullion was the result. The rock is rotten quartzite. It carries horn and chloride of silver. The gold is free milling.

WHITE PINE COUNTY.

The Rocco-Homestake M. Co., of Hamilton, has decided to make no more lead shipments and ordered all its ores banked at the E. & P. depot. The company is employing twenty-one men at the mine; eleven teams are hauling ore to Eureka. The cut in price from the original $4.57½ to the present quotation means a loss to the company of $12 per ton.

NEW MEXICO.

GRANT COUNTY.

Recently a corps of mining engineers, assayers, surveyors and prospectors was organized in Denver, Colo., by Terry & Ginger for a three years' trip through New Mexico, Arizona and Old Mexico. Boston men are back of the enterprise. They report some findings in the vicinity of Silver City.

LINCOLN COUNTY.

A strike is reported in the Old Abe gold mine, White Oaks.

SOCORRO COUNTY.

The Graphic mine and smelter is employing 200 men at Kelly and Magdalena. The mine and smelter are 1 mile apart, connected by an ore-car tramway, having a descent from the mine to the smelter of 500 feet. Stopes show a very regular wall formation in most places in the mine, and it is substantially timbered with stulls. The output varies from 75 to 100 tons of material per day. Near the main tunnel entrance are extensive lime quarries, from which the lime needed at the smelter is cheaply obtained. The mine is opened by means of six levels about 100 feet apart vertically. There seems to be one vein in the upper levels and two parallel veins from the third to the sixth levels. The veins have a 45° dip and are from 5 to 50 feet wide, standing within a limestone belt, bounded by shale on one side and quartzite on the other. The ores comprise iron pyrites, red and brown hematites, magnetic and lead carbonates, and sulphides, with important silver values in the lead. Some copper is also found. On the sixth level is a large body of zinc sulphide, none of which is being mined at present. Much of the tonnage is of high-grade sand carbonates, consisting of lead crystals of sand fineness. The iron ores, which occur in large bodies, are of value for fluxing material. The smelter is equipped with a 42x120-inch lead furnace, with a reduction capacity of 100 tons of ore per day. About ten cars of bullion are produced per month, besides a small amount of copper matte. Steel water jackets are used and are supplied with water from a 3-inch pipe line.

OREGON.

BAKER COUNTY.

The North American M. Co. at Copper Butte, 18 miles northeast of Baker City, has received machinery to go down 3000 feet.

Baker City is arranging for holding a mining congress in September.

The Burnt River G. M. & D. Co. is to build an electric plant to cost $75,000, 600 H. P., with capacity for operating mills, hoists and lighting mine.

GRANT COUNTY.

Copper has been discovered in the New El Dorado mining section, 10 miles west of Granite, near Susanville. L. W. Kempf says the copper ore in his Wisconsin mine is encased and in contact with slate, diorite, serpentine, porphyry and phonolite.

At the Red Boy mine Supt. Meikle expects to soon have the $50,000 hoisting plant installed to sink to the 2000-foot level.

At the May Queen mine Manager Thomsen has temporarily shut down the mill.

JOSEPHINE COUNTY.

The clean-up at the placer mine of Wimer Bros. & Co., at Waldo, is reported to be $20,000. The run was from Nov. 1 to June 1.

Hackler & Prinzanlar of Pasadena, Cal., have started up their $46,000 steam dredger in Rogue river, near Tolo.

PENNSYLVANIA.

The annual report of J. E. Roderick, chief of the Bureau of Mines, for the year 1899 shows that there was produced during that period 54,034,224 tons of coal in the anthracite region of this State and 73,066,943 tons in the bituminous region. The average number of days worked in the anthracite region was 120 and 296 in the bituminous region. Mr. Roderick says the dangers resulting from the mining of anthracite coal are constantly increasing, and he suggests that the English-speaking employes can help greatly to reduce the number of accidents by being careful and vigilant in the performance of their duties, thereby setting an example to their fellow workmen who are not familiar with the English language. He asserts that the use of electricity in any form in coal mines, especially in the bituminous regions, is a menace to life and property. There were 366 mines in operation in 1899 in the anthracite regions, giving employment to 140,583 persons, and 776 mines in the bituminous district, employing 91,442 persons. Mr. Roderick agrees with the mine inspectors that more than half of the accidents in the mines are due to carelessness of the victims themselves. He suggests that the number of mine-inspecting districts in the bituminous regions be increased from ten to twelve.

UTAH.

JUAB COUNTY.

Gen. Mgr. Geddes of the Swansea M. Co. shows that during the year for which his report is made his company marketed 12,262 tons of ore that yielded 478,700 ounces silver and 1,985,680 pounds of lead, the ore averaging forty ounces of silver with 8.32% lead per ton; amount paid company after deducting working charges at smelter and freight, $17.52 per ton; cost of extraction, $6.70 per ton; net receipts per ton, $10.82; that during the year 2112 feet of development work was done below 550-foot level.

SUMMIT COUNTY.

The annual report of the Ontario mine to December 31, 1899, shows that at that time the company had a reserve of $450,545.27. Other items include sulphides of silver, value $28,688.91; ores at the mine, value $29,252.52. The profits for the year were $130,667.12.

WASHINGTON.

FERRY COUNTY.

The mill of the Republic Reduction Co. is working $10 ore from the Black Tail, San Poil, Pearl and Ben Hur.

The Mountain Lion's cleanup averages $1000 per day, or $30,000 for the month.

At Republic ore rich in silver is reported in the Quilp.

Free gold ore is being taken out of the north drift on the intermediate level of the San Poil.

The two-compartment shaft on the Butte & Boston is down 200 feet.

The Chico mine shaft is 300 feet deep; Supt., R. H. Hewitt.

SKAMANIA COUNTY.

Supt. J. W. Spaulding is pushing exploration work on the Cannonball on Baker creek, Christina lake district, near Cascade. The company is expending $20,000 in development work.

SNOHOMISH COUNTY.

M. Swinerton at Silverton is general manager and Supt. Imperial M. Co. in Anacortes gulch. A tunnel carries a pay streak in copper and silver.

FOREIGN.

AUSTRALIA.

Australia's gold production for 1899 was 4,458,997 ounces, as follows:

Colonies.	1899 Production. Ounces.	Values.
Western Australia	1,643,876	£6,246,728
Victoria	854,500	3,418,000
Queensland	947,626	2,850,000
New South Wales	509,418	1,765,390
New Zealand	389,585	1,513,242
Tasmania	83,992	327,545
South Australia	30,000	119,000
Totals	4,458,997	£16,239,905

Queensland's comparatively small increase in gold output was to some extent the result of prolonged drought. The yield from the cyanidation of tailings is noticeable; one-third of the whole returns is due to this process.

BRITISH COLUMBIA.

The Granby smelter is completed, except the water power.

Following are official returns from the Ymir mine for April: Three thousand tons milled, producing 1657 ounces of bullion and 175 tons of concentrates; shipped 94 tons of concentrates; total receipts for month, $22,031; expenses, $7763.

Mgr. McDonald says that for the four weeks ending May 19th he shipped to the smelter from the Le Roi 13,216 tons of ore, value $219,000, cost per ton for mining, development, smelting, refining and realization expenses, $8 per ton, which would indicate a profit of $8.60 per ton. The mine is understood to be earning profits at the rate of $1,500,000 per annum.

At Fort Steele in the Sullivan the force is to be increased. Surveys for a tramway from the mine to the railroad on Mark creek are being made.

In Deadwood camp, in the Boundary district, the B. C. C. Co., owning the Mother Lode mine, is building a 300-ton smelter at Greenwood. F. Keffer is general manager. R. Liden is in charge of the smelter construction work. By October the work will be completed and the smelter blown in.

Shipments of ore from the B. C. mine, Summit camp, to the Trail smelter, average two carloads daily.

A. L. White, Montreal representative Graves-Miner Syndicate, is touring the various camps of the Boundary.

H. N. Galer made the last payment of $12,500 on the Hartford claim, Wellington camp, to Rogers & Jones. Total amount of bond, $35,000.

The report of the British Columbia Minister of Mines shows that the mineral production has risen from $2,608,803 in 1890 to $12,393,131 in 1899, this production made up of gold $4,202,473, coal $3,882,396, silver $1,663,708, copper $1,351,453, lead $878,870. Trail creek stands first, production $3,229,086; the Slocan next, $1,740,372; Nelson third, $879,185; Ainsworth fourth, $297,930; Osoyoos fifth, $234,167. Placer mining jumped to $1,334,900, caused by Atlin district, which produced $800,000.

Copper was produced during 1899 to the amount of 7,722,591 pounds, an increase of 6% over 1898, 75% of which came from Rossland. Silver-lead shows a material decrease; the tonnage in 1898 was 30,691; 21,507 in 1899. Silver production amounted to 2,939,413 ounces, a decrease of 1,357,619 ounces from 1898; the lead production was 21,862,436 pounds; 31,693,559 in 1898.

The Trail smelter has been kept going by ores from the Slocan, East Kootenay and the Boundary district, from which it has been receiving 750 tons ore daily.

LOWER CALIFORNIA.

A. W. Davis of the Viznaga mine is in San Diego with a bar of bullion from the new cyanide plant. It weighs 105 ounces.

H. Playter of Alamo, reports a strike in the Grande mine at that place.

In the Alamo section the Sterling mines, operated by Pittsburg capital, has high grade ore.

F. E. Russell at Alamo has started up work on the Aurora and Montezuma mines.

MEXICO.

Production of matte has ceased at La Cananea, pending the erection of a new smelter and the installation of modern machinery.

In the State of Sonora, at the Mulatos mine, Sahuaripa district, the mill is being put in order and a new smelter is to be erected, the whole giving employment to 500 men.

G. A. Tibbetts of Bakersfield, Cal., in the Soyopa region, Ures district, has denounced a copper mine.

At the Zubiate mine, 15 miles east of Minas Prietas, a triple compartment shaft is being sunk and a hoist with a sinking capacity of 3000 feet is being put in.

At Guerrero del Oro, H. J. Rose, Supt. Niven properties, is pushing the development. The mines are the Guerrero del Oro, San Jorge and San Agustin. The former has been extended 600 feet within three months. The San Jorge property is a contact of diorite and slate, a wet vein, producing sulphide of silver.

THE KLONDIKE.

Under date of May 21st, R. C. Diehl reports the following prices at Dawson: Milk, three cans for $1; eggs, wholesale, $45 a case; sugar, 16 cents per pound; salt, 10 cents; ham, 60 cents retail, 47½ cents wholesale; bacon, same as ham; tomatoes, $12 per case; all fruits 50 cents per can, except strawberries, which are 75 cents; flour, $14 to $16 per cwt.; onions, $1 a pound; potatoes, 75 cents per pound retail, 55 cents wholesale.

Catalogues Received.

THE Jackson Drill & Mfg. Co., Denver, Colo., have issued a neat catalogue (No. 12) describing that make of hand-power drill, giving good illustrations of the drill at work in various underground positions; also, with sectional view showing its mechanism.

THE 1900 catalogue of the Detroit Lubricator Co. gives illustrated specifications of its modern makes of lubricators, indicators, oilers and valves, with prices. Address, for free copy, Detroit Lubricator Co., Detroit, Mich.

Personal.

JNO. HAYS HAMMOND is in New York City.

J. L. GRIMES is the new Supt. Bellevue Con. mine, Ophir, Cal.

WM. ORR has returned to Salt Lake City from Denver, Colo.

GEO. BANCROFT, a Colorado mining engineer, is visiting San Francisco.

D. G. SPAR is now Supt. Mulatos mine, Sahuaripa district, Sonora, Mexico.

G. S. HOLMES has returned from Calaveras county, Cal., to Bingham, Utah.

B. S. SCHLESSINGER is now Supt. Hilda Co.'s mines at Fairplay, Park Co., Colo.

R. T. WHITE, Supt. Highland Boy, Utah, smelter, has returned from Montana.

W. E. HOWELL is succeeded as Supt. of the Pilgrim mine, Sierra Co., Cal., by A. Bixby.

C. P. SCHUMACHER, mining man of Leadville and Denver, Colo., is in San Francisco.

JNO. CARROLL of Singapore is inspecting mining methods and machinery at Grass Valley, Cal.

J. GEO. LEYNER, machinist and manufacturer, Denver, Colo., has returned from Milwaukee, Wis.

J. P. MUNGER is now Supt. Harvard mine, Jamestown, Cal. Thirty stamps are in operation at the mill.

GEORGE KISLINGBURY has returned to Berkeley, Cal., from an extended examination of mining properties.

AT the Quincy mine, Park City, Utah, J. G. Rhoden is succeeded in the direction of affairs by M. C. Harrington.

FRANK SUTHERLAND, formerly of San Francisco, has gone to Cape Nome in the interest of Colorado mining men.

W. H. SHELL is Supt. Pinto mine, Victor, Colo., succeeding F. Johnson, who becomes Supt. Hull City placer mine.

BERTRAM HUNT, who has been in northern Australia since September, 1898, has returned to San Francisco.

E. B. ROGERS of White, Rogers & Co., 306 Pine St., San Francisco, has returned to San Francisco from a business trip.

JOS. DEDERICHS, now at San Bernardino, Cal., has the contract for the erection of the Republic, Wash., mill.

F. E. SHEPARD, president of the Denver Engineering Works, expects to return from Boston, Mass., to Denver about July 1st.

H. C. LANGREHR has returned to San Francisco from southeastern Alaska, where he located forty-three mining claims.

JAS. DAVIS, Denver, Colo., representative of the Lima, Ohio, Locomotive Works, has returned to Denver from the Pacific coast.

GEORGE H. ELDRIDGE of the United States Geological Survey is to be deputed to examine and report on the petroleum fields of California.

F. L. BOSQUI, Supt. Liberty Bell, Telluride, Colo., cyanide plant, has been appointed Supt. of the works to succeed Carl Anderson, who goes to Arizona.

W. C. RALSTON, president California Miners' Association, will this summer reside at the Melones mine, Calaveras Co., Cal., to give it his personal attention.

R. M. JONES, electrical engineer, formerly of Salt Lake City, Utah, has charge of the construction of the electrical plant of the Pike's Peak Power Co., near Victor, Colo.

LEE COCHRANE, formerly with Mine and Smelter Supply Co., of Denver, Salt Lake and Mexico City, now travels for the Standard Fire Brick Co. of Pueblo and Denver.

THE Dexter G. M. Co., Tuscarora, Nev., has offered J. Whittaker of Virginia City, Mont., the position of Supt. of its 40-stamp mill, which was declined, as Mr. W. is operating on his own account.

DUNCAN MCVICHIE, late Supt. De La Mar's Mercur, Utah, mines, has accepted the management of the Bingham Copper and Gold Mining Co.'s Bingham mines, and all other propositions controlled by the Coram-Posey syndicate of Boston, and takes charge to-day.

K. G. BRUNNBERG of the Grangesberg iron mines, Sweden, is visiting the Lake Superior country and is locally quoted as wanting to see American mining machinery and methods. He says: "It is generally conceded that American mining machinery is the best produced in the world to-day, and we are going to equip our mines with gigantic plants of up-to-date American machinery."

CAPT. J. J. HEALY has resigned the management of the North American Trading Co. He will go to Nome and thence, he says, to Siberia, where he has a concession from the Russian Government that he considers valuable. His successor is Jno. Isom.

MARION DE VRIES is at Stockton, Cal. Regarding the California Mineral Land bill, he says: "The bill received the consent and united attention of the Secretary of the Interior, the Commissioner of the General Land Office and the delegation during this session with the result that the Hermann bill was agreed upon and favorably reported to the House. This bill in many respects is better than the Idaho-Montana act, and in my judgment in no respects inferior to that act. The bill was strongly pressed for a hearing when reported, and during the session. It is to be regretted that such could not be had. There is no reason why this bill should not become a law early in the short session of Congress, and in my judgment the well-directed efforts of the California Miners' Association will accomplish this most desirable result."

Commercial Paragraphs.

THE Union Gas Engine Co. of San Francisco is building a 300 H. P. gas engine.

MILLER & BUCHANAN of Denver, Colo., are to make the drills for the new Electric Drill Co.

FLINT & LOMAX, Denver, Colo., are filling an order for 10,000 oil cans for machinists.

MOCK & GARSIDE of Denver, Colo., are manufacturing steam and compressed air elevators for buildings.

HERMAN A. RYER has opened a branch store in Denver, Colo., for Howe, Brown & Co., steel manufacturers.

THE Standard Fire Brick Co. of Pueblo and Denver, Colo., are enlarging their plant at Pueblo to add tile and sewer-pipe works.

THE Franz-McRay Iron Works Co., Denver, Colo., have arranged to become the manufacturers of Lambing's hydraulic mining riffles.

SKINNER & SETHMAN, Denver, Colo., recently put in an electric lighting plant at Rawlins, Wyo.; also a hoisting plant at a Leadville mine.

ECCLES & SMITH are agents for the Griffin Wheel Co. in San Francisco. This company have shops in Chicago, St. Paul, Tacoma and Denver.

FAIRBANKS, MORSE & CO., through their Denver house, are supplying the Nabob G. M. Co. mine at Whitehorn, Colo., with machinery for a larger operating plant.

TWENTY-TWO miners from Nevada county, Cal., have gone to Honolulu to sink shafts for the Risdon Iron Works of San Francisco on sugar plantations, in charge of J. T. Leatham.

W. H. EMANUEL, Denver, Colo., recently sold a Robins conveyor to the Iowa G. M. Co. at Silverton, Colo.; also a 60 H. P. horizontal tubular boiler, with feed pump, to the Ago M. Co. in Arizona.

ON Monday of last week the Robt. Aitchison Perforated Metal Co. of Chicago received in their first mail orders from Vermont, Utah, Minnesota and Louisiana, showing that this company is well known from one end of the country to the other.

MCFARLANE & CO., Denver, Colo., have just finished a steel smokestack for the Gold Coin Co. at Cripple Creek, which is 14 feet diameter at the base, tapering to 7 feet at the top, and 138 feet high, the steel plates being $\frac{7}{16}$-inch thick at base and $\frac{1}{4}$-inch at top.

R. M. STEWART, Denver representative of the Crocker-Wheeler Co., is to furnish the electrical supplies for the Rocky Mountain Smelter at Florence, Colo., consisting in part of a 110 K. W. generator, four motors of 60, 28, 15 and 15 H. P. respectively; also a switchboard and eight arc lamps.

THE Denver Engineering Works have built two Loder hot blast furnaces for the Boston Gold & Copper Smelting Co. at Leadville; also one set of 14x27 rolls for the Iowa Gold M. & M. Co. at Silverton, Colo., and ten 15 H. P. and four 30 H. P. electric hoists for properties in Cripple Creek district. They shipped last week ten carloads of machinery and equipment to Utah for the Bingham Gold & Copper Co., including three matte smelting furnaces, slag pots, matte pots and fore hearths. They report an order for one of their new type 12x16 geared steam hoists. They are enlarging their foundry, making its capacity one-third larger. It will include new plast furnace and core ovens. They are issuing a new catalogue giving information on electric hoists, with working data as to electrical transmission.

A. MIDDLEBROOK, manager Denver branch Jeanesville Iron Works Co., reports sale of compound pump to city of Grand Junction, Colo., of 1,500,000 gallons per day capacity; also order from Mexico for compound condensing mine pump, and G. B. sinker, for Victor Fuel Co., two electric station pumps for B. & M. mine, Ward, Colo., and high lift station pump for Leadville.

WM. AINSWORTH & SONS, Denver, Colo., recently sent a consignment of assay balances and Brunton transits to their South African agent at Johannesburg, being the first of their shipments to that country since hostilities began—a larger order than usual. Messrs. Ainsworth report that the Alaskan expedition of the U. S. Geological Survey was provided with Brunton transits from their shops.

THE Pneumatic Cyanide Process Co., of Denver, Colo., have sold to the Salzer-Ford M. & M. Co., at Bear, Idaho, the exclusive right to the use of that process in Idaho and Washington counties, Idaho, and Union and Baker counties, Oregon. A milling right to use the same process has also been sold to the Red Warrior Chief G. M. Co., at Rocky Bar, Idaho, where that company is erecting a 50-ton cyanide plant.

CONSUL BRITTAIN at Nantes, France, says: "Inquiry has been made at this consulate for prices (by the ton) of lead and zinc of all descriptions. American manufacturers of these metals are requested to correspond with M. Albert Brosseau of 4 Rue Cambronne, Nantes, France, and submit prices. Samples of sheet zinc and small blocks of lead may be sent through the mails. Prices should be stated in francs and centimes, and the metric system should be used in giving weights and measures."

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING JUNE 19, 1900.

651,824.—TRACE FASTENER—F. T. Cambern, Walla Walla, Wash.

652,081.—MANUFACTURE OF GAS—J. W. Chisholm, San Francisco.

652,082.—WATER GAS GENERATOR—J. W. Chisholm, San Francisco.

652,086.—PROWSHARE—C. C. Coffinberry, Union, Or.

652,232.—FIRE DEFLATOR—C. A. Culp, Pacific Grove, Cal.

651,853.—STORAGE BATTERY—Hanscom & Hough, San Francisco.

652,227.—FURNACE—A. Heberer, Alameda, Cal.

651,861.—ROTARY ENGINE—J. B. Kelly, Portland, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WEIGHT MEASURER AND CUTTER FOR CHEESE.—No. 651,507. June 12, 1900. Louis Lacaille, Golden Gate, Cal. This invention relates to a device for accurately measuring the sizes of cuts so that by such measurement the cheese may be cut to the exact weight called by for the customer. It consists of a cheese case composed of two hollow semi-cylindrical segments, each formed with closed ends, one segment, being turnable within the other. Means are provided for fixing the outer segment upon which the cheese is supported concentrically with said bottom and turnable therewith. A knife having one end fulcrumed near the center of the top of the case is movable in a radial slot in the bottom of the outer segment and adapted to swing downwardly to cut through the cheese. Around the periphery is supported a scale which being applied to the cheese, shows the weight of any particular measurement upon the scale after the unit of any particular size of cheese has been ascertained. It enables the seller to exactly measure the size of the cut to correspond with the weight desired.

HYDRAULIC REVETING MACHINE.—No. 651,503. June 12, 1900. Stanton Foreman, Sacramento, Cal. Assignor to the Schaw, Ingram & Batcher Co., of same place. This invention relates to an apparatus for riveting the longitudinal overlapping seams for the formtion of pipe on joints, and is especially adapted for the smaller sizes of pipe on account of the difficulty in obtaining sufficient strength and rigidity of the unsupported end of small mandrels. It consists of a stationary frame with an arm or support, and a mandrel united at the rear and separated at the front, a fluid pressure ram upon the arm or support with a heading tool carried thereby, a yielding plate closing device and an internal heading tool carried by the mandrel, these tools operating at right angles to the arm or support, and connections with a source of pressure supply so that the upper heading tool is depressed. Other connections are located within the mandrel by which pressure is supplied simultaneously to act upon the plate closer so that the plates are clamped between it and the upper heading tool, after which the plate closer is moved backwardly by superior pressure upon the heading tool to allow the rivet to contact with the inner head-forming tool. In connection with this device is a carriage and mechanism by which the carriage is advanced a distance equal to that between the rivet holes after the setting of each rivet. There is also a supplemental slide by which more exact adjustments of the carrier and pipe may be made to riveting tools.

APPARATUS FOR SECURING PISTON PACKING RINGS.—No. 651,956. June 19, 1900. R. E. Strait, Sacramento. This invention consists in a means for forming a tight joint in preparing the packing of a piston by which the valve controlling the various air passages of an automatic air brake is operated. The piston is channeled around the periphery and is adapted to receive a snap or packing ring which fits into the channel and is designed to make a tight joint with the interior of the cylinder. Experience shows that in the operation and wear of parts, the packing joint becomes leaky, and it is necessary to fit a new ring but by various causes the channel becomes open so that the new rings which are kept in stock will not fit perfectly. My invention comprises a surface plate or bed having a central opening for the projecting end of the piston, which has a segmental edge and this edge rests upon the plate or bed. A cylinder is adapted to rest with one end around the edge of the opposite part of the piston and by means of a plate resting upon the upper portion of the cylinder, and bolts or screws the periphery of the piston may be compressed so as to again fit the interposed packing.

Latest Market Reports.

SAN FRANCISCO, June 28, 1900.

SILVER—Per oz., Troy: London, 28½d (standard ounce, 925 fine); New York, bar silver, 61¾c (1000 fine); San Francisco, 61¾c; Mexican dollars, 50c.

COPPER.—New York: Lake, 1 to 3 casks, 16.65 cash; carload lots, 16.25; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.12½; Casting, 1 to 3 casks, 16.37½; carload lots, 16.00. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.22½; Salt Lake City, 4.00; St. Louis, $4.00; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7, sheet 8, bar 6c. London, £17 10s = 3.80c per ℔.

New York this week reports an advance of ½ of a cent a pound in the price of lead made by the American Smelting & Refining Co.

Lead interests are inclined to believe that further advances will follow, as the recent heavy decline in prices was greater than conditions warranted.

The advance in silver to 61¾ cents comes at the same time, and is credited to a demand from China and Oriental countries, due to some extent to the Eastern political situation.

There is an idea that still further advances in silver, as well as in lead, will follow. If such advances should put lead to 5 cents per pound and silver 65 cents per ounce, it would mean much to the silver-lead mining interests of the country.

The duty on lead is 2½ cents per pound, and none has been imported except in ore for several years. The duty on lead in ores is 1½ cents per pound. The exports of pig lead for ten months ending April 2, 1900, were 246,552 pounds, valued at $11,182; for the fiscal year ending in 1897 there were 15,632,455 pounds, valued at $710,907. Producers of lead ore are said to believe that, by increasing the export trade, the American Smelting & Refining Co. could get better prices at home and could then pay producers more for their ore.

SPELTER. — New York, $4.25; St. Louis, $4.10; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

Ever Know an Engine Has Lungs?

The cylinder of an engine corresponds with lung action and in some ways is afflicted with lung trouble. For instance, too much moisture in the steam cylinder will cause more trouble than a damp atmosphere to a consumptive.

Vertical. Sizes 1½ to 12 in.

AUSTIN Separators

Horizontal. Sizes 1½ to 12 in.

Are the proper medicine. They eliminate all moisture and ensure the greatest efficiency to the engine. Shipped on 30 days' trial to responsible parties anywhere in the United States and freight paid both ways if not satisfactory.

ERICSSON SWEDISH TELEPHONES

Seem to possess almost human intelligence. They respond to every requirement in a smooth, positive fashion that shows what a perfect telephone can do. Besides this they have unequalled strength and durability. Their reputation as "STANDARD OF THE WORLD" is built on merit. Is the best too good for you?

ERICSSON TELEPHONE CO. 296 BROADWAY NEW YORK.

SMOOTH-ON TRADE MARK CASTINGS.

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

BUILT FOR THE
Anaconda
Copper Mining
Company
OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General Arrangement of Pelatan-Clerici Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

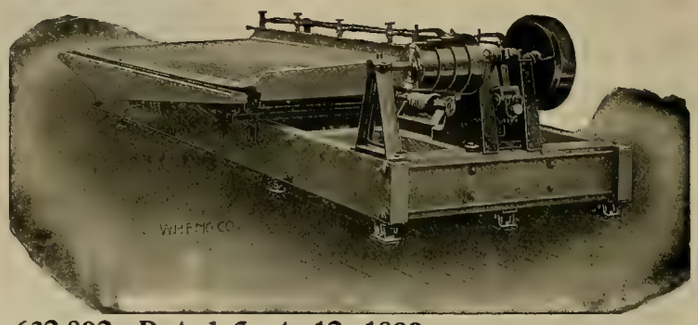
Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.



(SEE PAGE 749)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post,** March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents,** has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

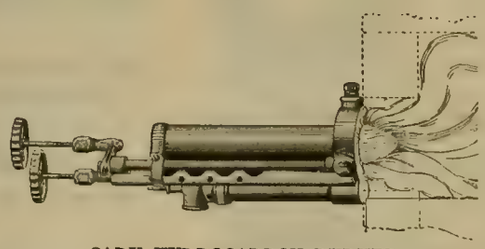
No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.



Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of star wheel on a threaded arbor, mounted on the center edge back of the beam.

By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

CATALOGUE ON APPLICATION.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

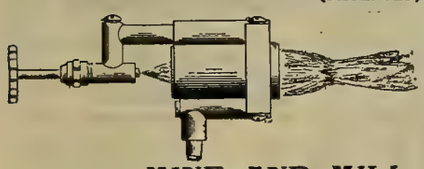
Wm. Ainsworth & Sons,
(Successors to WM. AINSWORTH.)
DENVER, COLO., U. S. A.

CARY HYDROCARBON BURNER.

CARY COMBINATION FURNACE.

TO ASSAYERS:

With the CARY BURNER AND COMBINATION FURNACE (PATENTED), shown above, it is possible to melt and cupel 144 assays in 12 hours with 5 gallons of gasoline.



Gasoline is cheaper, quicker, cleaner and cooler to work with than any other fuel.

We make Blow Pipe Outfits in various sizes for use with these appliances. Write for a copy of our new catalogue, in which these and our other specialties are fully described.

F. W. BRAUN & CO.,

THE WETHERILL MAGNETIC SEPARATING PROCESS

may prove the solution. Apply to Wetherill Separating Company, 52 Broadway, N. Y.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

NO MORE PACKING DIRT TO WATER.

—THE—

PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

THE LITTLE ALASKA GOLD WASHER.

Price $6. Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

Two trunk lines. 700 acres. 8100 feet on vein. Splendid concentrating proposition. 1500 feet development. Mine average: Zinc, 17.66%; lead, 9.57%; silver, 7.35 ozs.; gold, .04 ozs. Price, $30,000. Principals only. **H. E. RUNKLE, El Paso, Texas.**

INTERESTING TO MINERS!

FOR SALE.

Twelve Silvered Copper Plates, each 4 feet square, slightly used, ready for use, f. o. b. San Francisco.

1600 feet Steel Pipe, double riveted, 22 to 26-inch diameter, 10 to 12 gauge. Will stand pressure up to 300-foot head.

Also, one 3¾-inch Schuttler wagon and one road plow.

(Delivered at Libby, Montana.)

Second hand sawmill, complete with boiler and engine Kalispel, Montana.

A bargain can be had on any part or all of the above. Address S. T. F., Mining and Scientific Press office, 330 Market St., San Francisco, Cal.

ASSESSMENT NOTICES.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of June, 1900, an assessment of seventeen and one-half (17½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNAY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of May, 1900, an assessment (No. 23) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 21st day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of May, 1900, an assessment (No. 3) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 310 Pine street, room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of July, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—310 Pine street, rooms 36, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1900, an assessment (No. 12) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of July, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 1st day of August, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

DELINQUENT SALE NOTICE.

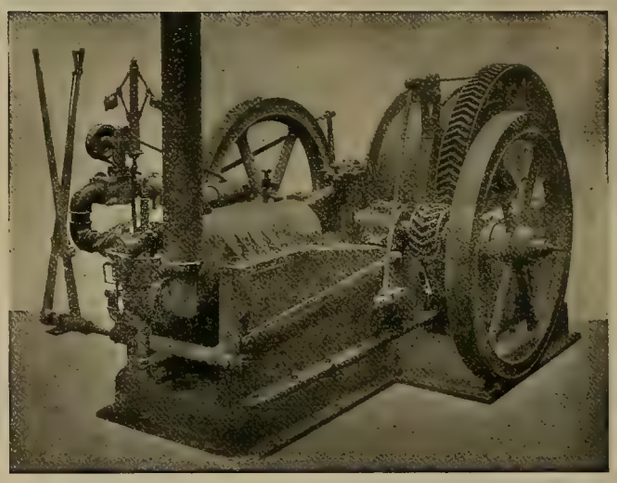
ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 8th day of May, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Richard Rising	409	1,000	$ 50 00
W. H. Langford	628	500	50 00
Inman Sealby	614	2,000	200 00
Reese Llewellyn	414	200	20 00

And in accordance with law, and an order from the Board of Directors, made on the 8th day of May, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 213 Jackson street, San Francisco, California, on WEDNESDAY, the 11th day of July, 1900, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. MIDDLETON, Secretary.



Office—213 Jackson street, San Francisco, Cal.

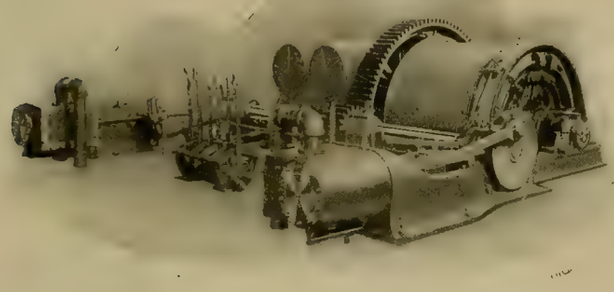
FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.



The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.
